FIGHTING FIRE.—Cottonwood *Index*, Aug. 11: Early last week a fire broke out on the South Fork, near J. M. Cook's farm, and despite all efforts to check it, spread rapidly, devouring everything in its path. J. Lynch was the principal loser, the wild flames reducing to ashes his granary, containing about 900 bushels of grain, and about 2½ miles of fencing. M. K. Miller lost considerable of the fencing around his orchard, and the intense heat scorched and killed many valuable fruit trees. It required great effort to save his houses and stubble from being swept away. Others lost considerable fencing and barely escaped being burned out of house and home. . . . Too much praise can hardly be given John Allen, foreman of the Diamond Range, for his noble efforts in staying the flames. His coolness and judgment in directing his men certainly did much toward helping to control the fire at times when it did not seem that twice the number could do much good. . . . Thousands of acres of feed have been destroyed, and whole sections of timber ruined. The heaviest damage is the destruction of feed and timber, although thousands of dollars' worth of other valuable property was destroyed. The general belief is that these fires are the work of incendiaries.

Sonoma.

HEAVY HAY.—Sonoma *Index-Tribune*, Aug. 13: Twenty-two tons of wheat hay was cut and baled this week on four acres of Frank Riser's land, two miles northwest of this place. As this hay will readily bring \$13 per ton, the product of these four acres amounts to \$286. Wm. Schukowsky, who baled the hay, informs us that it is the heaviest yield he has observed for years.

Sutter.

ORANGE CLINGS.—Farmer, Aug. 12: Chas. Weeman brought to our office a few days since a small limb of a peach tree bearing 12 peaches. When we say they were all very large, ripe orange clings, grown on trees not yet three years old, so full as to endanger their existence, and further, that Mr. Weeman has 200 such trees on his place at the lower end of town, it evidences the capabilities of the slough bottoms on which the above splendid specimens were grown.

Tehama.

HORTICULTURAL ENTERPRISE.—Red Bluff *Cause*, Aug. 15: Tehama county makes a splendid showing in the progress of fruit-growing. The number of acres planted to fruit trees is now estimated to be 175,293; to vines, 5972, making a total of 181,265 acres devoted to fruit-growing. Within the last three years many prune and olive trees have been set out. These trees, it is found, grow rapidly and luxuriantly in our soil. The orchards and vineyards are as yet all young.

Tulare.

THE PERENNIAL PEST.—Pixley Cor. *Delta*: The rabbit is one of the leading topics here, and likewise a great puzzle. Jacks seem to have taken possession of this part of the valley. They are shot by wholesale, but for every one thus sent to its doom there seems to be a whole litter substituted. Poisoning has been tried, but it is rather risky business. Cannot something be done to exterminate this nuisance? The amount of grain they destroy is immense, and in places it is impossible, without the protection of a rabbit-proof fence, to grow trees or vines.

FOOTHILL PRODUCTS.—Visalia *Times*, Aug. 11: E. B. Cluer of the Star ranch, in the foothills, 25 miles east of this city, last Monday brought to the *Times* office five tomatoes that weighed six pounds. They were not so large as one might imagine, but the flesh was solid, and their flavor was better than those raised in the valley. Mr. Cluer has raised tons of them this year, and is bringing them in quantities to this market, where they are readily sold at 1½ to two cents per pound. He states that his crop will last until Christmas, as his ranch is in the thermal belt where they have little or no frost, and he gives it as his opinion that, by setting out plants again, he can have tomatoes in this market in April next. On his ranch may be found blackberries, strawberries and all kinds of vegetables. Currant cuttings procured last spring, and set out in March, immediately took root, and have already produced several bunches of currants to each bush, fully matured and ripened. Fine potatoes are grown on the Star ranch—the first crop having been harvested, and the second crop now being planted. As for cabbage, the soil there cannot be beaten in the production of this vegetable.

Yuba.

HOPS.—Marysville *Appeal*, Aug. 12: The hop crop near Wheatland is reported the best in appearance that has ever been grown there, and should high prices prevail the growers will make an enormous profit. The time for picking is not a great way off.

NEVADA.

WASHOE HAY.—Reno *Gazette*, Aug. 15: Said a prominent Truckee meadow rancher last evening: "I have just been figuring on

this year's hay yield of the tract of country within, say five miles of Reno, and my figures add up 30,000 tons. The yield is much heavier than was anticipated early in the spring. I know of an instance where two crops of alfalfa have already been cut off one field, and each yield averaged over six tons to the acre. Several thousands of tons of the new crop in the stack have already been sold to cattlemen for \$6.25 a ton. Baled hay delivered in town brings \$10 a ton."

HORSES FOR CALIFORNIA.—H. Murdoc, living in the extreme northern part of the county, is in town, on his way to Sacramento, where he expects to sell a band of 185 horses now on the road to market. They are all good American horses, and will, the owner thinks, bring about \$14,000 in California. Mr. Murdoc says that the immense immigration of people to this coast consume a great many horses, and California is bound to grow as a market, especially for draft horses.

FRUIT SUITED TO THE REGION.—Said Mr. Kelly, the well-known Reno nurseryman, this morning: "You ask what kind of fruit trees I would recommend be planted in this section of Nevada. Well, apple, pear and plum, especially those varieties that blossom either very early or very late in the spring. Some trees blossom so early as to escape the dangers of the frosts that we have nearly every year about the 15th of May, but those that blossom late can, as a rule, be depended on for good crops. I keep at my nursery peach and cherry trees, and sell them to persons who are determined to have them, but I never recommend patrons to buy them. This is no peach nor cherry country." [We saw very good Mayduke cherries in Carson the first week in August, 1886, which had been grown at Genoa. This was the only variety that survived out of a large number which were planted.—EDS. PRESS.]

OREGON.

HOPS.—Portland *Rural Spirit*, Aug. 12: A letter from the McKenzie river, near Eugene City, says that owing to dry weather, the hop crop will not be equal to that of last year. The picking season will be later, and when it does commence, owing to the lateness, there will be a rush and pickers will be in demand. A 15-acre yard will pay out to pickers about \$1000. One merchant last year advanced \$6000 to hop-pickers. Over \$20,000 was paid out in Lane county last year to hop-pickers.

A NEW PAVILION.—A directors' meeting of the Mechanics' Fair Association was held at the Portland Savings bank Wednesday evening. There was a large attendance, and much interest was taken in the report made by Mr. Frank Dekum as to the new building the association expects to erect on B and 14th streets.

Sonoma County Notes.

EDITORS PRESS.—The busiest time of the year is upon the residents of Sonoma. There is plenty of work for willing hands, in field, orchard, hop-yard and forest, and in railroad building. Proprietors of canneries, fruit-driers, etc., find great difficulty in obtaining help enough to care for the fruit as fast as it is delivered by the growers.

There is a great deal of grain still to be thrashed. The yield of wheat, oats and barley has been surprisingly large. Everybody, it seems, underestimated the grain crop.

Hop-growers are in good spirits at the promise of a big crop. They also anticipate a fair price. Hop-picking will soon be in order, and already there is a great demand for pickers. Every man, woman, and child, who is able and willing to work, can find healthy and fairly profitable employment in the hop-yards during the next 60 days.

The boom has hit Sonoma county. During the past fortnight a great deal of real estate has been changing ownership, at prices that to the "oldest inhabitant" seem startling. Town and country property both find ready sale. There are two buyers for each piece of ground that is put upon the market.

Work has been commenced on the broad-gauge railroad from Benicia to Santa Rosa. There is no longer any doubt of the construction of this much-needed artery of commerce.

Those best posted in vintage matters think there will be fully two-thirds as many grapes in Sonoma county in 1887 as there were in 1886. The heavy frosts injured the crop materially, but there are many acres of new bearing vines to offset the damage done by frost and blight. Therefore the shrinkage will not be so heavy as many had imagined.

The annual fair of the Sonoma County Agricultural Park Association will open at Santa Rosa on Monday, August 22d, and continue during the week. Everything points to a most successful exhibition. The Pomona Grange is preparing an exhibit which will bring honor to the Order that collects, as well as the county that produces, such riches. It is expected that the editor of the PRESS will be present.

Our county is prosperous, our people happy, healthy and intelligent, and our success assured. OCCASIONAL.

Santa Rosa, Aug. 16, 1887.

DELEGATES TO THE FORESTRY CONGRESS.—Gov. Bartlett has appointed a commission of three to attend the American Forestry Congress, at Springfield, Ill., Sept. 14th to 16th. The Commissioners are John Muir of Martinez, Joaquin Miller of Oakland and James Bettner of Riverside.

His Messenger.

[Written for the RURAL PRESS by M. B. CULVER.]

Into the heart of a dusty town
A wandering bird dropped lightly down;
On a swinging spray he sat and sang
Till every street in the old town rang
With liquid notes from the silver bill.
Twitter and warble and softest trill
Entered houses through window and door,
And filled every shop from roof to floor.

Every one wondered, and paused to hear
The jubilant melody, soft and clear,
And many a hand brushed away
Moisture from cheeks where it seldom lay,
As pictures arose of valley and hill,
Of forest nook and mountain rill,
Of beautiful youths and maidens fair,
The dear old home and mother's chair.

The unconscious bird flew far away,
Through pastures green and meadows gay;
But the song lived on through all the day,
And an added softness gently lay
On the little town with houses gray.
Men spoke more softly, and women smiled.
The bird, with his song so undefiled,
Made each "become as a little child."

Calistoga, July 24, 1887.

Jim's Misfortunes.

[Written for RURAL PRESS by FANNIE ISABEL SHERRICK.]

James Stewart was a miner. He lived in one of the highest, as well as the most Western of Colorado mining towns, and his home was in one of the many little cabins that clustered at the foot of the great mountain overshadowing the town.

In this log cabin he kept house with another young bachelor friend, and, as women are scarce in a mining town, they were forced by necessity to perform all the household duties that are usually left to feminine hands.

But their success was really surprising in this direction, and there was not a neater cabin than theirs in all the camp. Both were miners, yet it chanced that they worked in different mines and in different shifts, so the house was seldom vacant. While one slept the other worked, and the labor of cooking, etc., was pretty equally divided.

But one day Jim, so he was generally called, had his time changed, and he, too, like his friend, plodded up the long steep mountain-side at midnight, lantern and candle-stick in hand.

But whether he toiled in the deep mine from midnight to dawn, or slept securely in the little cabin, lulled to sleep by the music of the river that rushed through the narrow valley, his thoughts were always the same—always of the bright-eyed girl he had left behind, the dear girl for whom he was working day and night. Some day he hoped he might build her a snug home, and they would live so happily among the grand old mountains which were so green and blossom-covered in summer, so pure and white in winter.

In spite of his rough exterior, Jim had a kind and tender nature, even a poetic one in some respects, for not a letter went to "Susie" that did not contain a few of the mountain flowers pressed between the pages, and many a night going up the mountain did he stand and look back upon the town beneath and the far-away stars above, drinking in the wonder and the glory of the world about him, and sometimes he dreamed over the sunrises and sunsets even as an artist would have done, with an innate love for all the infinite grandeur that God had created.

He sat in the cabin one afternoon, writing his home letter, when John, his companion, entered.

"I say, Jim, here a good investment for you—four shares in the 'Mountain Maid.' They've made a big strike there. They're keepin' it a secret to-day. To-morrow the whole town will be alive with the news. There's bound to be a big excitement over it, for it's a richer thing than the 'Granite' was. Collins gave me the cue. Now I tell you what, Jim, here's your chance if you want to make money. Buy these shares to-day and by to-morrow night you may realize a thousand dollars on two of them."

A thousand dollars! It looked like a big sum to Jim. He felt strongly tempted to invest his earnings in the scheme, and, persuaded by his friend, he eventually did so before the afternoon was gone.

And sure enough, the day following the mining shares trebled in value. The whole town was rife with excitement, and Jim was

but too glad that he had followed his friend's advice in regard to investing. Before night-fall he had disposed of two shares at a profit of more than a thousand dollars, with a prospect of a fabulous gain on the others.

His first impulse was, of course, to write to Susie.

"The dear girl," he said to himself, "she shall wear silks and satins yet, and who knows, perhaps diamonds." He smiled at the thought. What a change it would be for Susie, who was selling dry goods in New York.

Then he wrote her of his plans. In one month she was to be with him. He would begin the little home right away. As soon as it was finished she must come.

He began to count the days and how swiftly they flew by as he labored for Susie. In fancy he could see her blue eyes brighten over that last letter and the prospect of being so soon with him.

In the meantime he held on to his remaining mining shares.

But in less than two weeks they became scarcely worth the paper on which they were written. The rich vein reported by experts did not pan out as expected and the entire expectations of the company came to naught. Those who had invested largely were doomed to a bitter disappointment, and the excitement which had prevailed in the camp over the "Mountain Maid" subsided to an occasional grumble from the victimized ones.

But such are the ups and downs of mining life. As for Jim, he only set his teeth hard and worked with a desperate energy at his daily toil, as though every strike of the pick against that hard mother earth relieved in a measure his feelings against her for having foiled so many human hopes. To him she seemed pitiless in the denial of her riches; unlocking the doors of her treasure-house only to the favored few.

Yet in a day or two he rallied, becoming again his own cheerful self.

"You see I still have the money for the home and Susie's trip laid away," he said to John. "I shall not tell her of the other loss until she comes. With a cottage all our own and a few dollars saved, we surely can begin life together. I'm sure I can always make a living, even if humble for us both."

"Why, of course," John said cheerily, though he felt a little conscience-stricken for having advised Jim. "There's no use repining. You'll have a better start now than most folks."

"So I will," replied Jim, "so I will," and he went about his dish-washing and cooking with a brighter smile than ever, thinking how nice it would be when Susie came to be his helpmate.

And so his air-castles grew with his happiness and he laid many plans for the coming summer. But as usual, "man proposes and God disposes."

There came a cry of fire one night, then a pistol shot (which is the usual fire-alarm in these mining camps), followed by the clanging of the great bell that hung in the town, and down came the volunteer fire-corps as quickly as they could speed from town, tumbling head over heels down the steep embankments in their haste to reach the spot.

And there rose the flames higher and higher, reddening the mountain side and lighting up with a lurid glare the humble homes of the miners.

It was Jim's cabin, all ablaze, the flames leaping through the roof and from all sides before the firemen reached it. His neighbors awakened suddenly from sleep, gazing with terrified faces at the unearthly scene from their windows.

"Thank God there was no one in it," said one woman, knowing that Jim and his companion were at work on the midnight shift. "The whole thing went like a tinder-box and if there'd been any one asleep then, there'd been no chance of getting out that narry winder."

No one knew how the fire originated. It was supposed, however, that one of the men had left a few coals in the stove, which had accidentally fallen out, setting fire to some paper and the wood piled up in the corner.

Not a thing was saved, the cabin being almost totally destroyed. The cookstove was the sole article of furniture recognizable among the debris.

Jim and his friend of course knew nothing of this misfortune until the next morning.

When Jim reached the cabin and saw the wreck left by the fiery demon, he covered his face with his hands and almost wept. He was like one struck dumb.

"Cheer up, old boy," cried John, "all's not lost that's in danger. The cabin can soon be rebuilt, and as for our household goods, they were not worth much, you know."

Jim took his hands away from his face and looked at his friend for a moment in silence. Then he said quietly:

"John, all my money was in that cabin, hid away in a little box under the bed."

"Poor boy!" It was all John could say, looking up with a suspicious moisture in his own eyes. There was nothing he could think of to comfort his friend, but he walked toward the cabin, scrutinizing the charred remains of their household belongings with eager eyes. Presently he picked up something that glittered.

"It looks like silver," he cried. Let's have it assayed."

Jim shook his head. "I had more of it in bank bills," he said, "because I thought it easier to carry, and anyway I hardly think that could be a part of it."

But John insisted on having it assayed. However, he came back from the assayer's with rather a blue look.

"After all," he said, "it's no good, only the solder from our tea-kettle."

The loss of his money was a terrible blow to Jim, yet he tried not to be down-hearted, breaking the news as gently as possible to Susie, and making the future as bright as he could.

And Susie showed her true womanliness and her Christian spirit in her reply.

"Dear Jim," she wrote, though the tears fell from her eyes as she followed the page, "how thankful we should be that I was not out there. Things are never so bad but that they might be worse. God knows best, I am sure. He sends us these trials for our own good. Do not be discouraged as long as we both have life and health. I have managed to save something myself this year, and it is all yours, you know. Begin once more and keep up a brave heart for your own Susie's sake."

"God bless her!" Jim whispered when he had read the letter; "not a complaint, not a reproach in it. Surely she's worth toiling for—and may God make me worthy of such treasure."

Certainly the delay was hard for them both, but perhaps the sacrifice and the disappointment made each stronger and nobler. Certain it is that when the next spring saw them united, no two people could be more grateful or happy, even though their house-keeping was begun on a smaller scale, and they had no valuable shares in a great paying mine.

They were quite sensible enough to realize that the rich are not always the happiest.

True Greatness.

The path to true greatness is never found by searching for it. They who court fame, and plant themselves in her way whenever she happens around, are always those she fails to see when selecting her favored ones.

The man who burns the midnight lamp in a feverish search for this great end, who makes every stroke tell, who longs and wishes and counts his successes with miserly jealousy, is often distanced by some gentle woman who never dreamed of greatness, whose only hope of reward was the approbation of those for whom she labored, and who wakes as from a dream to hear her praises sounded from every side. It is not because the man has chosen a harder path—a more crowded path—than his modest sister, but only because fame is generally a just divinity who crowns those best fitted, though she does not always reward those entitled to her blessings.

Little did Goethe's Lottie dream in her far-away German home across the seas of the millions who would read of her lovely sunny nature from the charmed pages of the devoted poet. She was only a simple girl performing her homely duties for her father, and being mother and elder sister both to the helpless children of the family, yet her womanly dignity, her sweet girlish innocence, her quiet beauty, so charmed the great Goethe that they are present even to us now, though a hundred years have passed since she so unconsciously won his praise. And thus it is that no labor, however mean, is without its reward. To do each duty well and the best we can is all that is required, for nothing that falls to our lot should be unworthy of our efforts. And since only true genius or true nobleness of character deserves greatness, if we do the first and are the last, we will surely find the royal road to fame.

AN Irish woman once made a remark worth noting. It is the custom in Ireland on the occasion of a death in the family to invite all the neighbors to the wake over the body; but "once on a time" this old woman was slighted by not being invited. She watched the people going to the ceremony for awhile in silence, but at last, unable to contain herself longer, she said: "Well! well! I'll have a corpse of me own in me own house some day, and then you'll see who'll be invited."

Helps in Home-Making.

Our wise and famous poet of long ago, the illustrious Milton, has said, "Nothing lovelier can be found in woman than to study household good." And hence all who take part in discussions of home work, engage in a study which to the mind of the poet is superlatively lovely. Then certainly it cannot be said that the helpful letters of this column can in any sense be pronounced trifling or unworthy the attention of intelligent and practical managers of the home. All should study. No matter how thoroughly or systematically a lady may have learned housekeeping, the steady advancement of the day will be sure to make some improvements on old-fashioned methods and she will be profited by finding them out. Women are not receiving their great aids in the way of labor-saving inventions and the like, for naught. Many bright, inquiring minds working together discover helpful modes of performing unpleasant work, and hit upon useful little discoveries that are truly startling, in view of the fact that they are so simple and yet have never been thought of before.

But I have one question to ask that has never been answered satisfactorily—to me at least, and if any kind sister would take interest enough to answer it, should she be able, I shall feel very grateful. It is this: When dark-green ink has been spilled on new marble and has remained long enough to be absorbed, what will remove the dark shadowy stain that has seemed to sink below the surface polish? PENELOPE.

Humorlets.

A CONVICT, however poor, can always have a watch and chain.

ONE of the greatest puzzles to the observing spectator who watched the youngsters playing cohenhagen, was to know why those girls who fought so hard against being kissed played the game at all. They didn't have to.

THE Cleveland Medical Society expelled a doctor for agreeing to take no pay if he did not effect a cure. The unanimous opinion expressed was that the establishment of such practice would fill the almshouses with physicians.

HE sat on a log on the banks of the Arkansas creek, when a traveler came along and saluted:

"Good day, mister. Waiting for a rise?"

"That's just what I am waiting for," was the reply.

"Got a flat-boat up stream?"

"No, sir. I'm a government engineer. Congress has appropriated \$18,000 to improve the river, and I'm waiting for a rise so I can find the stream. How long since you saw anything of it?"

WEBSTER'S spelling-book has had a circulation of over 50,000,000 copies.

YOUNG FOLKS' COLUMN.

Poor Baby.

Is it not rather a cruel joke to play on Tommy to run away from him right in the woods where it is so still and lonely? He looks very sad about it. The girls seem to think it is fine fun, for they are laughing behind the tree. Of course when he begins to cry they will run to him, but we think it is too bad to frighten a baby even for a moment. Tommy may learn to be afraid and that will be sad, for boys should be brave, you know. We wish a mouse would jump out of the bushes and then we would see who would be frightened.

Sparrows in the Tuileries.

[The following pleasing sketch was written from Paris for the *Youth's Companion* by Minnie Buchanan, formerly of California and well known here.]

Little Toinette is a French child, as you may guess by her name.

She was baptized Marie Antoinette; but like some American children I know, she chatters so fast that when she tries to tell her name it is hard to catch more than the two last syllables; so Toinette is what all her little playmates call her.

Toinette dearly loves little birds, and every fine day she goes with her mamma or the nursery governess to the Gardens of the Tuileries to feed the sparrows there.

The children of Paris have a great many parks and squares to play in. Toinette's little brothers and sisters like best to go to the Champs Elysees, where there are Punch-and-Judy shows, goat carriages and long rows of little booths where cakes, candies and sweet drinks are sold.

But there is so much romping and noise in the Champs Elysees that the birds are frightened away, and Toinette likes birds better than anything.

So she gets her mamma to go with her over to the Tuileries, for, although the gardens of the Tuileries and the Champs Elysees are very near together, you must, to get from one to the other, cross the Place de la Concorde, a big, open place, where crowds of carriages are always passing, and it would be very dangerous for a child to go alone.

Toinette thinks it is fun to cross the Place de la Concorde. There is a tall obelisk in the middle, a big fountain each side, and a row of great statues all around. At the foot of each fountain or statue there is a small raised stone sidewalk for people to stand on to save themselves from the carriages.

When Toinette is going to cross she takes her mamma's hand, and they wait on the edge of the first sidewalk until there is an open space between the carriages; then they run over to the walk around the nearest fountain or statue, and wait there for another opening, and so on until they get across.

There are no kind policemen to help you across, as in the American cities. French policemen, even when they are near, pay no attention to you or to the carriages.

Doubtless many of you know that on this very Place de la Concorde the queen for whom little Toinette is named, the beautiful Marie Antoinette, was beheaded.

Toinette hurries over to the Tuileries, and down the wide stone steps that lead to the garden where all the little princes since the time of Louis XIV have played.

There she sees her beloved sparrows, dipping their bills in the great round basins of

water sunk in the ground, hopping about in the tranquil open spaces of sward, or saucily picking at the eyes and noses of some of the gray statues that stand around on their pedestals.

Toinette takes a package of bird seed from her pocket and runs over to a small stand on one side to buy a loaf of bread for two cents; a little round loaf, that looks as if it were made for a doll.

When the loaf is broken into little crumbs, the fun begins.

A good many birds know Toinette and fly around her as soon as they see her near the bench where she is accustomed to feed them.

She begins to chirp to them in a sweet voice, saying to them in French: "Here my birds, come my pretty birds, Toinette has brought the breakfast for her dear little birds."

When they hear this the birds come to her in a perfect cloud, twittering, chirping and making a fluttering noise with their wings.

She throws the seeds in the air. That is a pretty sight, for the birds dart in and out, catching the seeds before they fall to the

other side of the River Seine, Toinette knows it is time to go home.

The birds all fly to their nests in the trees of the Gardens of the Tuileries.

Toinette, who is a rosy-cheeked little lassie, keeps her eyes bright by going to bed not long after her birds are asleep.

GOOD HEALTH.

HOW LONG SHOULD A NERVOUS PERSON BE TREATED?—The question of how long treatment should be continued in a neurotic case when no evident benefit is produced has recently been raised in a Hamburg law court. A medical man, says the *Lancet*, having as a patient a merchant suffering from "nervousness," treated him by galvanism. Altogether he galvanized him 445 times, but the nervousness did not disappear. Then came the matter of fees. The sum claimed was \$556. The merchant disputed this on the ground that the treatment ought not to have been continued so long, as it was not producing any benefit. The court referred the matter to the medical board, which gave as its opinion that the doctor ought to have asked the patient, after some 50 sittings, whether he would like to continue

DOMESTIC ECONOMY.

APPLE DUMPLING.—Sift one quart flour, add half a teaspoonful salt and lard half the size of an egg. Wet up with cold water to a stiff dough. This divide into six or seven parts. Pare as many good-sized apples, cut through the middle, removing the core; cover with the dough, pressing the edges together till no seam remains; then when all are ready roll two or three times over in dry flour, and drop into boiling water. Boil steadily half an hour, not once lifting the lid till ready to remove to the table. Eat with cream and sugar sprinkled with grated nutmeg.

CINNAMON RUSK.—Take one cup mashed potatoes, one of sugar, one of hop yeast and three eggs; mix all together. When light add half a cup of butter, one tablespoonful of ground cinnamon and flour to make a stiff dough; let rise; make in small cakes and put in buttered pans. When light, grease the tops with butter; sprinkle thickly with sugar and cinnamon; bake in a quick oven.

COLD LEMON PUDDING.—One-half box of gelatine soaked in four tablespoonfuls of water for 10 minutes; add a pint of boiling water, juice of two lemons, one cup of sugar; strain and set away to cool.

When cold, stir in the whites of three well-beaten eggs. A thin boiled custard can be used to pour over this pudding, or thick, sweetened cream.

TRANSPARENT PUDDING.—Beat eight eggs very light, add half a pound of sugar, the same of fresh butter, melted, and half a nutmeg, grated; set this on the stove and keep stirring until it is thick as buttered eggs; put a puff paste in a pie-plate, and bake in a moderate oven. This quantity will make two pies.

ITALIAN SAUCE.—Put into a saucepan a little parsley, a shallot, some mushrooms and truffles, if to be had, chopped finely, also a piece of butter as large as a walnut; warm them together; add half a glass of white vinegar, some pepper and salt; let all boil gently for half an hour; strain and add a teaspoonful of oil.

CREAM CARROTS.—Cut in half-inch bits one pint of carrots. Boil in just enough salted

water to keep from burning; when tender, add one pint milk or cream, one tablespoonful cornstarch, butter the size of an egg, salt and pepper to season. Simmer five minutes and serve very hot.

BROWN BREAD.—One pint each of Indian meal, graham flour and buttermilk, two-thirds of a cup of molasses and one teaspoonful each of soda and salt. Steam three hours. Sour milk may be used instead of buttermilk by using a little shortening.

DRIED FRUIT ROLL.—Take a small loaf of bread dough, when ready for baking; roll it about half an inch in thickness; spread with the fruit made smooth and seasoned; commence at one side and roll up, and steam an hour; eat with butter sauce.

JUMPLES.—Rub to a cream a pound of butter and a pound of sugar; mix with it 1½ pounds of flour, four eggs and a very little brandy; roll the cakes in powdered sugar; lay them on flat buttered tins and bake in a quick oven.

CREAM SPONGE CAKE.—Beat two eggs in a cup and fill up the cup with sour cream; one cup of sugar, one and one-half cups of flour, two level teaspoonfuls of baking powder. Flavor with lemon or vanilla.

STEAMED RICE.—One cup of rice, one teaspoon of salt, three cups of boiling water; steam one hour; add one cup of sweet milk; cook 20 minutes longer, when it is ready to serve with cream and sugar.

SCALLOPED ONIONS.—Boil, and if large cut into quarters. Put into a shallow dish, cover with white sauce and buttered crumbs, and bake until the onions are brown.

COCOANUT PUDDING.—One pint of milk, one grated cocoanut, four well-beaten eggs, two tablespoonfuls of butter melted and sugar to taste. Bake a light brown.

BABES IN THE WOODS.

ground. Such a shower of seeds and sparrows, such a rush of little fat bodies and little brown wings you never saw.

When Toinette has used all the seed, she seats herself on the bench and scatters crumbs on her lap, on the ground and on the bench at either side. This is the prettiest sight of all.

The sparrows fly all around her, on her head, on her shoulders, and often right into her lap. She talks to them very softly and the birds are as bold as can be, for they know she is their good little friend.

Toinette, you must know, is a very small girl, only five years old; and when she is seated on this bench in the Tuileries, her toes do not touch the ground.

Sometimes when her feet are swinging a crumb will fall on the end of her slipper, and two saucy sparrows will cling to her foot, fighting to see which shall have the crumb.

The old carved stone benches in the Tuileries, those that have been there since the time of Louis XIV, are very pretty to look at, but they have no backs.

So Toinette always sits on one of the new benches, quite like those we have in our parks in America.

When she has been seated a few minutes there will always be a row of sparrows along the back of the bench on either side of her. Generally these are the young ones who cannot fly very well. They sit and balance themselves like little fat balls, while the mother and father sparrows bring crumbs and feed them.

When the big red sun begins to drop down behind the Chamber of Deputies, on the

them, as it was doubtful whether the treatment was doing any good. The court, however, declined to accept this view, holding that it was for the patient to say when he had tried the treatment as long as he was disposed to pay for it, and so gave judgment for the full amount claimed. This judgment seems to accord with the principle that applies to newspaper subscriptions. A man must pay for his paper as long as he takes it from the postoffice.

VALUE OF LIME-WATER AND MILK.—Medical and other professional men often break down from their inability to keep a regular time for meals. An eminent doctor says: "Being often out for many hours, and becoming too exhausted to digest a full meal when at length able to get it, I conceived a plan which answered admirably well, and which other doctors have gladly adopted. I provided myself with a small bottle of lime-water, which I add to milk when passing a dairy-shop; or I put a small flask of the mixture in my pocket. A water biscuit with this will keep a man harmless on a long fast, and enable him to digest a meal when he can obtain it."

INGROWING NAILS.—The *British Medical Journal* says: Dr. Mial has used tannin for ingrowing nails, and does not find it necessary to enjoin rest. A concentrated solution—an ounce of fresh tannic acid dissolved in six drachms of pure water, with gentle heat—is used by painting the irritated soft parts twice a day. Two cases recently had no pain or lameness after the first application, and went about their work immediately, which they could not do before. The painting with the tannin is to be continued until the nail has grown to its proper length and breadth. No other treatment was necessary.

The Week.

The twin displays at San Jose, one in Horticultural hall and the other in Agricultural park, are well under way as we write, and with pleasing promise, high hopes and large attendance. They happily inaugurate the Pacific fair season of 1887, and what with county, district and State exhibitions, the next two months will afford an unbroken course of entertainment and instruction to the persistent fair-goer. The inward flow of moneyed immigrants from the East abates not, but waxes; and the wave of "boom," which has so long been gathering volume in the Southern California counties, and sending advance ripples and splashes up the coast and over the Tehachapi, now bids fair to become tidal, and roll its prosperous surges far north of the Golden Gate. The division of large bodies of land, the piping of water upon them, the auction-sales of lots on town-sites, and the general activity in real estate and rise in prices have already reached as far up as Sonoma, and the beneficent epidemic shows no sign of abatement. Well, let the happy settlers come—between San Diego and Shasta "there is room for millions more."

The Pacific Railway Commission.

We don't know how the representatives of the United States Government, in the persons of the Pacific Railway Commissioners, were treated during their sessions at the East; but we shall not blame them if they leave California with the idea that it is a pretty hard place and wholly under railway domination. We have read the reports of their sessions with considerable diligence, and our conclusion is, that they have been pretty thoroughly baffled, and not very pleasantly baffled, either, in their effort to find out a few things about the manner of construction of the Central Pacific and the manner of the administration of its affairs, so that it cannot pay its debts to the Government, and so that if the Government should take the road at the maturity of its mortgage, it would have a line with no terminals, and one which would not pay the cost of running cars over it. People have suspected as much, but the fact has not come out so badly and unhandsoemly as it has during the few days' investigations of the Commission in this city. The whole state of the case seems to be, that this unfortunate concern in whose treasury at one time "there was not a single cent for 17 days" should have been built by Government aid in such a way that the builders were all made helplessly rich, and yet the concern itself never accumulated anything, and now is not worth taking as a gift, if the grantees had to run trains upon it.

This seems to be what has been learned by the inquiry of the Commission. Every effort they put forth, which seemed likely to disclose how this state of affairs came about, was promptly met by loss of memory as long as that game would work; then by loss of books and records, and then, when witnesses were approached with questions which did not relate to memory nor to records, they blankly refused to answer—of course, under advice of counsel, chief of whom is a gentleman who, a few years ago, could not find anything too bad to say of the official acts of the men whom he is now advising to silence. Perhaps he knows better than any one else that silence is the least dangerous answer. And so the Commission had to appeal to the United States Courts to decide whether they could insist upon a witness answering their questions. This appeal seems to have availed nothing, nor, in fact, would any one expect much from it. Courts have often proved exceeding tender of the feelings of these corporations.

We hardly think this Commission has been fairly treated by the people of California. Possibly the knowing ones argued that the business is over with, the deed's done and not to be undone, and what use is there now to incur the opposition of powerful men simply to determine whether the Government has fairly lost the land and bonds it gave to build the road? The question now is not a living issue. So many lines are now in competition that there is no likelihood of a return to the old discrimination and extortion, so let it go, and if those most interested can save their reputations, it will be best on the whole.

By some such reasoning as this, perhaps, the people have satisfied themselves and have held aloof while the Commission has been waited on, at first obsequiously and finally defiantly, by the retainers and henchmen of the railway, until on Tuesday what seemed to be a climax was reached, which is reported by the *Bulletin* in these words:

Chairman Pattison asked Mr. Cohen if he had any witnesses to produce. That gentleman replied by calling upon Mr. Littler to swear the chairman, as he desired to ask him a few questions. The other two Commissioners thought the formality of swearing the chairman a useless one, as he was already under oath.

"Well, then," said Mr. Cohen, "I call upon the chairman to produce every letter he has received as chairman of this Commission, that they may be put upon record."

Mr. Pattison looked somewhat surprised, and smiled, evidently thinking Cohen was joking. The latter repeated his demand emphatically, when the chairman said he would not entertain the proposition a moment, and he considered it the height of impertinence on the part of counsel to make such a request.

Mr. Cohen said he believed the defendants here, for such the railroads appeared to be, had a right to know who had been inspiring the questions and compiling the figures that have been used in this investigation. He said measures would be taken to get the opinion of the United States Court on the question.

Chairman Pattison remarked that all the letters he had received were turned over to the

secretary of the Commission as soon as read and were now in his possession.

It seems to us that this was the height of discourtesy, and, to use a mild term, it was a disgrace to California that a chairman of a Government Commission, sitting in our city, should be set upon in this way. It is charitable to believe that the legal gentleman who offered this insult to the Commission has lived abroad so much of late that he has unlearned much of his California breeding.

And so the railroad "has the right to know who is inspiring the questions" which they find themselves compelled to refuse to answer. Why do they wish to know? Are the questions only answerable by crimination of the respondent? And if so, what is to be done to the people who suggest such questions to the Commission? Are they to be set upon by all the hired myrmidons whom the company, according to the testimony, seems to have had all along to flay those hostile to it?

The whole matter has an uncanny look, and the manner of its progress has not been creditable to our people either for what they have done or for what they have left undone. The Commission has exhibited a most praiseworthy determination to get at important facts and thus discharge its duty manfully. It has met with no open support from our public; it has been brow-beaten and badgered by individuals, whose motives are perhaps best known to themselves. We are glad the future sittings are to be at the East, for if they should remain here longer we should tremble for our reputation. Enough has been done already to lead us to apprehend in their report very little that will be creditable to California manhood or public interest.

Lest the foregoing may be thought to contain insinuations that those high in railway authority have not told the truth in their testimony before the Commission, we desire to add that such an impression is not intended. The remarks are intended to apply to what was not told rather than to statements actually made. For instance, since the above was written, Senator Stanford has filed a sworn statement before the U. S. Court in which he declares as follows:

In my testimony given to the Commissioners I have said in substance, and now repeat, that I have never corrupted nor attempted to corrupt any member of the Legislature, or any member of Congress, or any public official, nor have I authorized any agent to do so.

We do not doubt the truth of this as a personal statement, but what the Commission and the public desire to know is, rather whether such things were actually done than by whose authorization or authority. The railway people seem to think, according to some of their statements, that this investigation is being pursued as a result of personal spite against them. Such a motive should not prevail, most assuredly. It seems to us that the investigation is merely to ascertain how public business has been transacted and the inquiry is wholly in the public interest.

Death of Ex-Senator Sargent.

Hon. Aaron A. Sargent died very suddenly on Sunday last, Aug. 14th, at his residence in this city, after a brief illness, from which it was hoped he was recovering.

Beginning life as a printer boy in Massachusetts, he came to California in '49 and was soon publishing the *Nevada City Journal*. He subsequently studied and engaged in the practice of law, until in 1860 he was elected to Congress.

After serving three terms in the House of Representatives and one in the U. S. Senate, he was sent, under President Arthur's administration, as Minister to Germany. His vigorous support of the rights of American pork-shippers rendered his position at Berlin so unpleasant that he resigned and returned to San Francisco, where he resumed the practice of law.

Chief Justice Searls, a political opponent, but warm personal friend of the ex-Senator, says: "As a man, he was upright, honest and true to his friends; as a lawyer, he was active, energetic and brilliant; as a citizen, he was the possessor of excellent qualities, and, although a strong partisan in politics, had very many things in his character to admire."

Mr. Sargent was in his 60th year. He leaves a widow, one son and two daughters.

Look Out for Sharks.

Although we have very many thoroughly conscientious real estate men (we speak it boldly), there are some of the most unconscionable rogues in the business, and the intending purchaser must look carefully out for them. One of their chief methods of operation seems to be finding Government land for a large fee. How they work practically can be learned from the following extract from an article in the *Livermore Herald* of last week:

The attention of the *Herald* has been called to a deception practiced on parties looking for Government land in this vicinity. It claims that parties furnish descriptions of Government land for a large fee, always payable in advance, and send intending purchasers to the country, where they are met by an agent and shown the land claimed to be vacant. The purchaser returns to the land office, files up and pays the Government fee, and on his return finds he was duped, the land shown belonging to other parties. A German, now in town, was taken in in this way. He spent all his means, and now finds out the land filed on is a mass of chaparral and rocks, six miles from the land shown him. Another San Francisco party brought his entire family and household goods to the mountains and spent nearly \$1000 before finding out he was duped. There is no Government land in this vicinity fit for cultivation, except by an immense outlay of time, labor and money, and the truth should be told to strangers. Considerable feeling is being stirred up by these affairs, as they are working a great injury to the country.

This is a most wretched and disgraceful piece of business, and criminal prosecution should lie against it. There is one way in which the intending settler can ascertain much about the Government land still available in this State, and that is by application to the Immigration Association, at 10 California street. This association is supported by contributions from enterprising citizens, and we know its officers are highly esteemed. They have maps of the counties showing Government lands still open and descriptions of the character of the land. One can get much information for the asking, instead of being robbed of big fees and lied to by the real estate shark, as in the case described by the *Livermore Herald*, as quoted above.

Railroad Lands Thrown Open.

It was telegraphed from Washington that on August 15th the Secretary of the Interior revoked the order of withdrawal of indemnity lands for the benefit of the Atlantic & Pacific Railroad Company, and in a long letter to the Commissioner of the General Land Office directs that they may be restored to settlement under the pre-emption and homestead law.

It is stated that between 25,000,000 and 30,000,000 acres are involved in this decision in the case of the Atlantic & Pacific alone. The order also applied to all the other railroads named in the secretary's rules of May 23d last, except the St. Paul, Minneapolis & Manitoba, the Hastings & Dakota, the St. Paul & Pacific, the St. Paul & Sioux City, the Sioux City & St. Paul and Winona & St. Peter. These are still under consideration and undecided.

The Atlantic & Pacific Company seems to have made a hard fight to retain possession of the lands now thrown open, alleging errors of the Government in the matter, etc. Secretary Lamar's comments upon this point will be received with satisfaction as showing that there is a power which corporations must respect. We quote this paragraph:

Criticism upon the alleged shortcomings of the Government with respect to this grant came with an ill grace from this company. The people, whom the Government represent, had some rights under the grant as well as the company. On full consideration of the whole subject, I conclude that withdrawal for indemnity purposes, if permissible under the law, was solely by virtue of executive authority, and may be revoked by the same authority; that such revocation would not be a violation of either law or equity, and that said lands having been so long withheld for the benefit of the company, the time has arrived when public policy and justice demand that their withdrawal should be revoked and some regard had for the rights of those seeking and needing homes on the public domain.

HOPS IN NEW YORK.—At the annual meeting of the N. Y. Hop-Growers' Association, held at Utica on the 15th, Oneida, Madison, Lewis, Otsego and Montgomery counties were represented. The reports of delegates showed the crop will be about half that of 1885, while the acreage is from 25 to 35 per cent less.

Lakes Donner and Cascade.

The accompanying cut presents a view of two notable Alpine waters, Donner and Cascade lakes; the former named after the Donner family, who, in the fall of 1846, perished near its borders, and the latter after a beautiful cascade that pours its waters into the basin of this lake. They lie on the eastern slope of the Sierra Nevada mountains, Donner two miles west from the town of Truckee, and Cascade 20 miles to the south of that place, and a little to the west of Lake Tahoe. Donner is three miles long by one and one-half miles wide, Cascade being of somewhat smaller dimensions. The former is situated at an altitude of 6000 and the latter of 6552 feet above sea level; the waters of both being clear, pure and cold. Donner, which is very deep, occupies, like most of these Alpine lakes, a depression rooted out by an ancient glacier. It is drained by the Little Truckee river, which, running two miles east, unites with the main Truckee, the outletting stream of Lake Tahoe.

Donner was originally surrounded by a heavy forest of pine, spruce and fir, the most of which in the vicinity of the lake has since been cut away, leaving only a fringe of the primitive forest standing on its margin. The hills around, denuded of the stately trees that formerly clustered thickly over them, present now, with their hideous stubble of stumps, an altogether forlorn and desolate appearance. With "its dream of woods" there has departed much of the glory of the landscape as seen before it was so ruthlessly marred by the axe of the lumberman. Once felled, the trees are not on this more arid slope of the Sierra followed so soon by a new growth as on the opposite side of the range; and, unless the second crop of trees shall be protected and nurtured or artificial arboriculture shall come to be practiced here, not again will this generation or the next see anything like the original tree-growth restored to this once grandly beautiful wilderness land. In descending from the Summit the traveler on the Central Pacific railroad gets at one or two points a tolerably good view of Donner lake, but not of Cascade, which lies at a greater altitude and a long way from the line of the road.

Looking at Lake Donner, sleeping so placidly in its glacial bed, it is hard to believe that there ever should have been witnessed on its shores other than scenes of tranquillity and peace. And yet, in these majestic solitudes, far from the abodes of civilized man; here, under the shadow of the great mountains, in "the sounding aisles of the dim woods" by the softly murmuring waters of the Truckee, there occurred at the period mentioned one of the most trifling events ever recorded in history—an event so sad and appalling that the name attached to this lovely water will stand forever the synonym of heroism and horror! A brief sketch of this occurrence is as follows:

With the overland immigration to California of 1846 there came a company from Illinois under the captaincy of Geo. Donner, a former well-to-do farmer of that State, who brought with him his wife and six children. By reason of unexpected delays this company failed to reach the Sierra Nevada until the early part of November, when, having arrived at the base of these mountains, they followed up the Truckee river till they came to a point one mile above the site of the present town of Truckee, where they camped for the night.

As usual, these immigrants turned out their stock to graze, a procedure against which they had been warned by Truckee, their Indian guide, who advised them that the weather threatened a storm. And, sure enough, the snow began to fall during the night and continuing for several days, reached such a depth that it was impossible for these people to find their cattle, which, scattering, had sought shelter in the woods and deep canyons with which the country abounds.

For protection against the cold and inclement weather the snow-beleaguered immigrants set about constructing rude cabins, and it being found that they would soon be short of provisions, a party was dispatched over the Sierra to Sutter's Fort for a supply. Meantime, the scanty stock of food became exhausted and the entire company was reduced to the direst extremity when the relief party from the fort arrived with such limited quantity of provisions as they were able to bring, wallowing through the snow. They found their companions in a terrible condition, the whole of them nearly fatally famished, thin, their strength gone and bodies reduced to skeletons. Several had died

in camp, the survivors in some instances having fed on their remains; and if report may be credited, more than one of the children had been put to death to furnish food for such of these unfortunates as had become insanely reckless. A good many, seeking escape from their impending fate, had endeavored to make their way over the mountains; while a few of these succeeded, more turned back discouraged, quite a good many having perished in the attempt.

On examination, the fearful discovery was made that two of the company, Captain Donner and Luis Keisberg, being too much enfeebled to travel, and there being no means for carrying them, would have to be left behind. This was a hard alternative, but there being no help for it, these two brave men, on being made acquainted with the situation, quietly submitted to the inevitable.

And now came the hour for parting, the wives with their husbands and the children with their fathers, for Keisberg, too, had his family with him. And this parting, as all well knew, must be final, there being but little food to be left for the abandoned men, and the winter being now too far advanced to leave any hope of more being brought in. When it came to be determined whether she would go with her children and live or stay with her husband and die, Mrs. Donner chose the latter, nor could the entreaties of the wretched father alter her purpose. This settled, the heroic woman embraces her little ones, kissing them over and over as she presses each to her heart; then looking tenderly into their eyes she sadly turns away. The rough men around, moved to tears, with soothing words and gentle force then place her in the cabin and hasten their departure, for already there are signs of a gathering storm, the chill gray air foreboding more snow. There is no time for lingering, there is danger

LAKES DONNER AND CASCADE.

and possibly death in delay. The children must be mounted on the backs of the men and all must up and away; and so they hurry off, leaving the three doomed ones behind.

The passage of the mountain is successfully made and all, the rescuers and the rescued, arrive safely at Sutter's Fort. Two months having passed by, another party made their way over the Oordillera to Starvation Camp; not now with the hope that they would find there any one alive, but merely to gratify that natural desire of our kind to know the worst. Arrived at the hut and entering, they were astonished beyond measure to find there Keisberg still alive, the poor creature having subsisted all this time on the flesh of Mrs. Donner, which, after her death, he had taken the precaution to pack away in the snow. Though horrified at his recital of the cannibalistic feast, this party commiserating his sufferings, kindly cared for this most unfortunate of all men, taking him with them to Sutter's Fort, where he was tenderly nursed and all his wants provided for until he had fully recovered his health and strength.

Despite his protestations to the contrary, there are some who believed Keisberg took the life of Mrs. Donner for the purpose of prolonging his own. But however this might have been, few will care to sit in judgment on a case in which the offender is not amenable to any human tribunal—in which, if arraigned, he may justly claim acquittal under the ruling that self-preservation is the first law of nature. After the mournful events we have related Luis Keisberg was no longer the man he had been before. From the genial and companionable person of former days, he became moody and finally morose and misanthropic, his whole life being darkened by the shadow of such a great calamity. Let us hope that with the sunset of life the clouds will be lifted, revealing their silver lining and the cheery light beyond.

HARVESTING by the light of blazing gas wells is the latest agricultural trick in Indiana. The toilers find it much more comfortable than working under a mid-day sun.

A Field Day for Combined Harvesters.

The State Board of Agriculture is doing for the new combined harvesters what we would like to see extended to the whole family of agricultural implements—that is, to hold field trials, at which committees inspect their work and farmers have a chance to be present and judge for themselves of their operation. There were two field days for combined harvesters this year, one on Aug. 11th, the other Aug. 14th. Both were held near Stockton, which is a headquarters for the manufacture of these machines. The first was on low tule ground, with much down grain, on the farm of R. C. Sargent, the other on hard ground with straight grain on the farm of Miss Julia Weber. At each trial there were present some of the committee of Directors of the State Society, consisting of H. M. Larue, Chris Green, G. W. Hancock and C. M. Chase. The other member of the committee, C. Singletary, was not present. Secretary Ed Smith of the State Society accompanied the committee.

At the first day's trial on Mr. Sargent's farm, the test was made on reclaimed tule land, that had a heavy mixed growth of wheat, barley and weeds, lodged and tangled in all shapes. The ground was soft and yielding, not only to the horses, but the machines also sank sometimes until the framework touched the ground. Under all these conditions, the test was indeed very severe. For this trial five machines ap-

"Little Houser" with 14 animals, turned out as much grain as the Holt and Improved Houser with 22 animals each, and was credited with 6½ sacks. The Love Houser machine saved 9½ sacks and the Tretheway machine picked up six sacks.

Of course all the machines worked at great disadvantage in such grain on such soil, but the result is of great importance. Mr. Larue credited with saying: "The trial of the harvesters was very satisfactory, as it proved that combined machines could cut any grain on tule lands, pick up the worst-lodged grain and save as much, if not more, grain than any other harvesting machinery. The committee wanted just such a trial for these machines, and he was surprised to see such heavy machinery doing faultless work."

The second day's trial on August 16th was the greater one, judged by the number of machines in the field and the number of visitors present. The grain stood up well except in one place at the upper end of the field, where there was some oats and a patch of lodged and tangled grain, which caused considerable annoyance. The grain was very smutty and made an excellent test for cleaning machinery.

For this trial nine combined harvesters of five different patterns were entered for competition, some of them being new, while others had been used by farmers through several seasons. The Shippee Harvester Company had three Houser machines in the contest. Two of them, a large improved machine and the "Little Giant," were new, and the other was George Mosher's. Tretheway & Martyn had two "rubber" machines, Holt Bros. had one of their manufacture owned by John Bunch and C. H. Wakefield, Matteson & Williamson had two "Harvest Queens," and Myers & Cowell entered their link and V-belt harvester. Besides these, there were on exhibition, but not competing, Hudson & Patterson's steam harvester, which moved about in the grain like a thing of life. Miller's Centennial Young push machine was at work in the field.

Following is the record of each machine's work as kept by Secretary Smith, with the measurements and other data recorded for the committee:

No. 1—Tretheway & Martyn's "Rubber"—	
Size of cut, feet.....	10
Animals.....	14
Men.....	3
Size of cylinder.....	48x21
Sacks of grain.....	5½
Weight of grain, pounds.....	747
Weight of screenings, pounds.....	28
Time of run, minutes.....	18
Stops, minutes.....	1:10
No. 2—Houser (George Mosher)—	
Size of cut, feet.....	14
Animals.....	20

These records afford much interesting data concerning the machines which should be kept for reference. The contest lasted until evening. Interested parties kept up with the machines, and about 50 buggies were strung along in the rear. All along the route after each machine farmers got down on their knees and scraped over the ground to see what quantities of grain were lost by the machines. It was found that all the harvesters did good work, and there was but little complaint from any one about the waste of wheat.

In the evening there was a public inspection of the grain samples from the different machines. Of the result of this examination, the *Stockton Independent* of Aug. 16th says:

The work of the improved Houser was found to be the cleanest and best, very little smut being noticeable in a large lot of wheat. The other samples were well sprinkled with smut, and some of them had considerable straw. The work of the Holt and Harvest Queen, No. 1, was next to the Houser, as the committee judged from the samples. Samples of the grain thrashed at the first contest were compared with yesterday's samples and examined together. The committeemen were strengthened in their unofficial opinion that the improved Houser is the best cleaner.

This judgment is of course unofficial, and the report of the committee will not be made until the time of the State Fair. Though this report will be of value and interest, we count the greatest benefit of such trials in the opportunity it affords inventors to bring their machines into use before large numbers of farmers who are able to judge for themselves of the good points in each machine.

RAPID TRANSIT.—The *Reno Gazette* tells of a man at Lake Tahoe, employed by the Virginia & Gold Hill Water Co., who heard one morning of an accident that had happened to his father the day before and at once made arrangements to come and see him. A box six feet long and V-shaped, so that it would readily pass through the company's large flume down the mountain to Lake View, was made for him. Lying down in it, his head resting on his satchel, the cover was nailed on. He had a hole cut in it large enough to allow him to look out when he so desired. The box and contents were carried to the flume and laid in the rushing water, and off it darted at lightning speed. Shortly afterward he was at the base of the mountain, having traveled a distance of eight miles in as many minutes. He kicked the cover off the box, got out and boarded the Virginia & Truckee local passenger train that came along, bound for Reno.

PROF. AND MRS. J. G. LEMMON.—The *Paso Robles Leader*, noticing the presence in that town, last week, of our whilom contributor, Prof. Lemmon, and his wife, indulges in some reminiscences of a mountain-scaling trip with him, years ago, and closes as follows: "Prof. Lemmon is well known among botanists and naturalists, and has spent many years in the pursuit of his avocation. He found the home of the common potato away up in the mountain fastnesses of Arizona, and nearly paid for his curiosity by being hunted by the Apaches. The Professor's life has been a checkered one, embracing service in the army during the rebellion, and a term in the awful prison-pen at Andersonville, Georgia, where he endured privations from which he has never fully recovered. He and his worthy wife count their friends by the hundred all up and down the coast, and the writer is proud to be considered among the number."

HOW TO TOTE A BIG MELON.—A Los Angeles county watermelon, said to measure five feet in girth and to weigh 103 pounds, was on view in the window of the *Call* office in this city last week. The question arose how to handle so huge a piece of refreshment—for carrying even a 30-pound melon in the arms is no trifling task. But "necessity is the mother of invention," and the *St. Louis Globe Democrat* says a young Missourian has devised a double running noose of wire with a wooden handle, by means of which a melon can be carried as readily as a valise; and now all the melon men are wondering why they never thought to invent the thing.

Alkali Soils.

EDITORS PRESS:—"Reclaimer," in his article on the value and reclamation of alkali lands in your issue of August 6th, appears to forget that (as I have elaborately shown in my reports on the subject) the alkali infesting such lands is of very variable kind and intensity, and that what is sufficient to render them productive in one case may be altogether ineffective in another. "Reclaimer" has apprehended correctly that deep and frequent tillage is an indispensable condition in the successful cultivation of all alkali lands, and that surface irrigation is to be avoided in all cases. But in order that tillage may be practiced, land must first be tillable; and that is too often not the case where alkali prevails, especially on adobe soils. Some such soils defy all tillage when impregnated with "black" alkali (carbonate of soda), and to render tillage possible the noxious salt must first be neutralized by means of gypsum, as long ago prescribed by me. Again, there are cases in which seeds will not germinate in alkali soils even when these have been deeply tilled and irrigated from below. This may happen either because the amount of alkali present is too great, or, again, in the case of "black" alkali, which usually makes the seeds rot in the ground.

Again, there are soils in which even sub-irrigation will bring the alkali to the surface, this depending on the fineness or coarseness of the soil texture.

What your correspondent says about the intrinsic richness of alkali soils is assuredly true, since the alkali salts are to a great extent merely the surplus plant-food left in the soil by deficient rainfall and drainage. But to bring out their merits it will not do to work blindly, by rule only, otherwise disappointment will too often follow. **E. W. HILGARD.**

Mission San Jose, Aug. 9, 1887.

Fresno Notes.

EDITORS PRESS:—Much is said about Fresno county and her lands which is thought by some to be a delusion; but by a residence here one will feel as the Queen of Sheba felt after she had beheld the wisdom of Solomon, that the "half had not been told." The wheat harvest is now about completed, and thrashing machines are running at their full capacity, and hauling wheat to the different warehouses is the order of the day. The wheat yield is far beyond expectations and of very fine quality. The fruit crop is abundant this year, especially peaches, pears, nectarines, apricots and grapes. I don't think there is a spot on God's footstool that will beat Fresno county on peaches, apricots, nectarines and grapes. Meade & Co.'s fruit-drying and raisin-packing establishment has been running now a little over two months, and they have received from 4000 to 6000 boxes of fruit per day ever since the peaches began to ripen. Since they started up, the Pacific Fruit Company of San Francisco, under the management of Mr. Williams, Fresno's pioneer nurseryman, has built another drier here of the same capacity, and is also running in full blast. Meade & Co. have about 300 or 400 women and children employed, besides men who make the trays on which the fruit is dried and boxes in which it is shipped. This gigantic work of those two packing-houses is a blessing to the fruit-growers and the people in general of this county. The fruit-growers are enabled to get remunerative prices for their fruit, and the labor class finds employment. They pay a cent and a quarter per pound for the fruit delivered at the drier, and at these prices some orchards have paid their owners from \$200 to \$250 per acre. Mr. Conlan, one of our prominent fruit-growers, received from 250 apricot trees \$572. The apricot yields well here. Mr. Covell, another fruit-raiser, had a tree of apricots that yielded 19 boxes of about 42 pounds to the box.

The two fruit-packing companies are offering five cents per pound for Muscats and Muscatel raisins, which will pay the owners about \$150 to \$200 per acre. The raisin-growers are expecting to do well on their raisins this year, although the yield, they think, will not be as heavy as last year.

According to the statistical report of the San Francisco Produce Exchange, I see that Fresno county is the third county in wheat-raising, and I think she is going to be the banner county on fruit. I have lived in Sacramento county for 12 years, where it is claimed as fine fruit is grown as is found in the State, and Fresno beats them on apricots and nectarines, and I am almost persuaded to say on peaches, too, for they ripen more perfectly and they are just as large and of sweeter flavor. Fresno grapes have a world-wide reputation for being the finest grapes. The Sacramento river, I think, beats us some on the Bartlett pear, but not bad enough to boast of, and our strawberries and blackberries cannot be excelled.

Fresno City is growing very rapidly and I think ere long can boast of a city of 20,000 inhabitants. The enterprising citizens of the place are doing all they can to make it a model city. Thos. E. Hughes is having a hundred-thousand-dollar hotel erected now on I street, opposite the Masonic temple, that is going to

rival most of the Occidental hotels and will reflect great credit on the place. Uncle Tommy knows how to do things and his heart and soul is for Fresno county. Several fine brick structures have gone up in the last year. Old wooden buildings are giving way to fine brick structures and everything shows improvement. Mechanics and laborers are in great demand and wages are good.

The real estate firms have done a good business during the past season and they are consistent men—they show their faith by their works; they not only sell land, but they buy and own and improve land; they spend their money here; they expect to live here, educate their children here, and spend their days here, and, in fact, we have an industrious, wide-awake population—men, women and girls who are not afraid to work and don't think work a disgrace. If our people only pursue their present course and do the work themselves, have their children work, and not rent their lands to Chinamen and let their children grow up in idleness, we shall have a prosperous, thriving, and happy population. The old adage that idleness is the mother of vice is as true as gospel, and I think many parents have seen this demonstrated in California. **W. P.**

Fresno City.

THE VINEYARD.

The Grape Interest of Santa Clara.

The meeting of the Santa Clara Viticultural Association, held last Saturday, was the annual meeting. In his address as retiring president Mr. D. C. Feeley said:

During the past year we have had quite a large accession to our membership, and questions of vital importance have been discussed.

The establishment in San Jose of a storage wine-cellar with a capacity of half a million gallons, under the care of a competent cellar-master, was freely discussed, but for the present deferred.

We have been seeking information relating to the condensing of grape must, and the best machines available for that purpose, and it is confidently expected that by the time the vintage of 1888 is ready there will be one or more of these factories in active operation in the county.

The prices paid for wines of the vintage of 1886 have been, as a rule, unsatisfactory, in fact in some cases below the actual cost of production. This is only a temporary depression, caused by the wine combination in San Francisco, as the market for California wines in the East has been steadily increasing. If the wine-producers wish relief from the corners made at their expense, they must organize and meet combination with combination. They should organize co-operative wine-cellars wherever there are grapes enough to warrant it, and put a competent man in charge of them. Inferior grapes should be grafted over, or their product sent to the still, and only good wine should be offered for sale.

Last spring a gentleman told me that he had just sold 4000 gallons of wine of the vintage of 1885 for 35 cents per gallon, and in order to make room for this year's vintage he sold 37,000 gallons of the vintage of 1886 for 14 cents per gallon. The new wine, he said, was as good as the old at the same age. Here we had a difference of 21 cents per gallon, or \$7770 on the quantity sold. This showing tells its own story and furnishes food for reflection. I feel confident that the public-spirited gentlemen who own and operate the eight banks of this county will assist this struggling industry by loaning, upon reasonable security and at a low rate of interest, the necessary means to hold these wines until they ripen, when they should be sold in the East as Santa Clara county wines.

I think I reflect the feelings of this society when I express thanks to Prof. Hilgard for his untiring efforts to advance the wine interests of this State; also to our secretary, Mr. Combe, for his many able articles relating to the industry in this county, which have appeared from time to time in the local press, and were extensively copied throughout the State.

Election and Other Matters.

The secretary, L. D. Combe, submitted his report for the term. It showed total receipts from fees and dues \$78; expenses, \$18.75; committee expenses, \$9.50; general expenses, \$23.65; paid over to treasurer, \$18.85; total, \$70.75; leaving balance on hand of \$7.25; amount in the treasury, \$83.

The election of officers for the coming year then took place, Mr. Feeley declining to serve again, and resulted as follows: President, John T. Doyle; vice-president, D. Wright; treasurer, Frank Dunn; secretary, L. D. Combe.

Doyle spoke of the necessity of action at an early date in having an interview or open consultation with Senator Stanford, Congressmen Felton, Morrow and others of the representatives who would attend, in regard to needed legislation for the wine interests of this coast.

On motion the secretary was instructed to notify Senator Stanford and the Congressmen that a meeting for consultation, to be held in San Francisco on August 24th, would be agreeable; and a committee consisting of Messrs. Doyle, Portal, Pierce, Merithew and Combe was appointed by the chair to make all necessary arrangements.

HORTICULTURE.

Paralysis of Apricot Trees.

The following essay by Rev. M. Ongerth of Alameda was read at the last meeting of the State Horticultural Society:

At the last meeting of your society a very important essay was read in relation to the apricot and all that concerns its cultivation. I regret not having been able to attend the meeting so as to follow its very interesting and instructive discussion. Being myself a pomologist, I take the greatest interest in the matter. I now take the liberty to call your attention to the experience I had with a certain peculiarity of the apricot tree. Three times I had an opportunity (twice in my own orchard and once in that of my neighbor) to observe paralysis on two apricot trees from five to six years old, and on one apple tree four years old, grafted on English Paradise. The symptoms were in every case the same. All three trees excelled by surprisingly exuberant growth, by very healthy foliage and by abundant normally developed fruit. I observed these three cases in different years, but they all occurred at the same time of the season—that is, toward the end of June.

In the morning the trees appeared to be in full health; shortly after 10 o'clock the stems of the leaves suddenly became weak and every leaf without exception hung lifeless on the tree. In the afternoon the fruit and the bark began to shrink, and in 48 hours all leaves and young shoots were entirely withered and the fruit shrunk and nearly dried up. I tested two trees with the knife, and found that paralysis and death had taken place from the grafting point upward, whereas, the part below the graft, that is, the trunk, neck of the root, and all roots, had remained intact and perfectly sound. I understand that similar cases have occurred in California; I therefore state the method to prevent the same.

According to information collected from many parties it results that no weakly tree is attacked with paralysis, but only those which exhibit too exuberant growth; therefore these alone require careful watching. To prevent the paralysis, simply bend a branch or bough of medium size so as to break it, but without separating it from the body of the tree; if necessary, a slight cut may be made with a saw or otherwise, so as to facilitate the breaking. Let the branch with all its fruits and leaves hang on the tree until the following spring; then cut it off and cover the wound properly. Every single fruit on the tree thus treated will fully ripen and the tree itself will soon show moderate, normal growth. The very greatest care should be taken when cutting off the branch in the springtime, not to make a wrong cut, so as not to stimulate the wood growth, which would increase the tendency to paralysis instead of decreasing it.

There are cases of partial paralysis where only one branch is struck by it; in such cases, the tree, as a rule, recovers. Nature, in such instances, has helped herself and produced that effect which man does by breaking the branch.

Varieties.

Classed among the best apricots are the three following: The Breda, the Beauge and the Ungarian Best.

The best known of all is the Breda. It is of medium size, its pineapple taste is refreshing and its productiveness surprising. It belongs to the very best of its species; it has one advantage which no other species of apricots possesses—that is, seedlings from its stones but very rarely degenerate, so that, as a rule, 95 per cent of its seedlings produce the genuine Breda and therefore do not require grafting.

None but the stones of the very best fruit, entirely ripened on the tree, should be used as seedlings.

The Beauge belongs to the large-sized fruit, superior for its size, its beauty and flavor, as also for its productiveness and the soundness of the tree.

The Ungarian Best is most likely the least known here. Its size is large to very large, has a greenish-yellow flesh, is very sweet and of a delicious flavor. In regard to productiveness and durability of the tree, this kind is second to none.

If the soil is very dry, graft the apricot on peach or almond; on any other soil, graft on apricot seedlings or plum, of which latter the St. Julien is the best for this purpose.

Remarks.

After the reading of the paper the secretary of the society remarked that the Breda was long ago discovered to be a very unsatisfactory bearer, at least in some parts of this State; also that working apricot upon almond was disapproved by California experience. A good union is not made, and the trees, though they may grow to a considerable size, will part at the union and show that the fibers have not knit together.

SEVERAL of the southern counties are taking measures to make displays of their products at St. Louis next month, in connection with the G. A. R. Encampment, for the sake of swelling the boom yet higher.

THE White river Utes in Colorado are reported to be on the war-path, and the Governor has telegraphed for U. S. troops to suppress the trouble.

Ladies' Toilette.

This consists of a ladies' jacket and costume. In this instance the jacket is shown developed in fawn-colored broadcloth, and is superbly adjusted. The front is made double-breasted by a handsomely shaped gore joined to the right front. The closing is made in double-breasted style with button-holes and ball buttons to just below the waistline, but may be continued to the edge if desired. The seams at the back and sides are beautifully curved, and so are the single bust darts which fit the fronts, all being arranged in the manner known as "lapped," which is effected by lapping one edge over the other flatly and stitching each edge to position. The shoulder seams are made in a similar way. The outline is rounding, and a uniformity of depth is observable all around, the edge being finished plainly.

LADIES' TOILETTE.

In the lower part of the side-back seams are inserted narrow loops which turn forward and are stitched at the edges. The collar is in high rolling style and is mounted on a band, and two rows of stitching finish its edges; a clasp closes it at the ends of the band. The sleeves show five rows of stitching at their wrists and fit in a superior manner.

When fine cloths, such as that here used, are made up, the edges are not turned under and stitched, but cloths that show a tendency to fray had best be turned under before stitching. Sometimes a lining of silk or Surah is added, being finished separately from the edges of the jacket. All light shades, such as pearl, putty, mastic, mode, etc., and also dark greens, blues, grays and browns, are favored for jackets of this style. Broadcloth is preferred for such jackets, but checks, cheviots, stripes, etc., may be chosen if desired.

The costume is developed in novelty wool goods, and its gores are trimmed as far up as exposed by the drapery with a double box-plaiting of the material. The plaits are broad and are pressed well in their folds and stayed underneath. This plaiting is not a part of the pattern, but can be easily made. The costume will be liked especially for all varieties of cotton textures. Bands will frequently trim the

skirt instead of plaiting, or a gathered or kilted flounce will be chosen.

The hat is of fancy straw, with a facing of velvet on its rolling brim; it is trimmed with a full scarf of gauze and a bunch of flowers and leaves.

This pattern may be had of H. A. Deming, 124 Post St., S. F.

Los Angeles County Nurserymen.

The annual meeting of the Los Angeles County Nurserymen's Association was held at the office of the president, T. A. Garey, 115 West First street, Aug. 5th, and is reported in the Los Angeles papers. The following officers were elected for the ensuing year: T. A. Garey, president; A. M. Herbert, vice-president; Byron O. Clark, secretary; Milton Thomas, treasurer. The executive committee of last year was re-elected.

The secretary was instructed to have a re-

skirt instead of plaiting, or a gathered or kilted flounce will be chosen.

Origin and End of Worlds.

(Translated from *Diario del Hogar* by M. N. M.)

The following is an extract from a recent lecture by the eminent French astronomer, C. Flammarion:

How many years has the sun been revolving? On the hypothesis that nebulous matter may have been in its origin of extreme tenuity, the quantity of heat engendered by the fall of all these molecules toward the center which has produced the solar system, has been calculated. Granting that the specific heat of the condensing mass may have been that of water, the heat of condensation would have sufficed to produce an elevation of temperature of 28,000,000 degrees Centigrade (Helmholtz and Tyn-dall).

It has long been known that

Heat is Only a Mode of Motion;

It is an infinitesimal, vibratory movement of the atoms, all heat converting itself into motion, and all motion into heat. This condensation sufficed (and much more) to fix the present temperature of the sun and the original temperature of all the planets. If this brilliant star continues condensing, as is possible, a condensation that should diminish its diameter by 2-1000 of actual longitude would engender a quantity of heat sufficient to cover the loss of the emission during 2000 years. In the present degree of the emission, the solar heat produced by the former condensation of its mass would still last 20,000,000 years. The measure of time exacted for the condensation which the primitive nebula underwent to form our planetary system

Defies our Imagination.

To compute it by thousands of millions of centuries would be no exaggeration. The experiments of Bischof upon the basalt seem to prove that in order to pass from the liquid to the solid state, and to cool from 2000 degrees to 200, has required for our globe 350,000,000 years. The sun had already existed many other millions of centuries. What is all the history of humanity in comparison with such a period? A bubble on the ocean. During thousands of centuries the terrestrial globe rolled in space like an immense chemical laboratory. A perpetual deluge of boiling water was falling from the clouds upon the red-hot surface and was ascending in vapors to the atmosphere to fall again. When the temperature came to be less than that of boiling water, the vapor liquefied and was precipitated. In the midst of these frightful tempests, the terrestrial crust—broken thousands of times by the convulsions of the central fire—was vomiting flames and was being solidified; the surging volcanoes were making elevations above the levels of the hot seas, and the first islands appeared. The primary semi-fluid combinations of carbon formed rudimentary

Attempts at Life,

A substance which hardly deserves the name of organic, as it was not merely mineral, nor yet vegetable, nor animal. The primitive plants—the algae—which float inert upon the ocean, were now in progress. The primitive animals—the zoophytes, the elemental mollusks, the corals and the medusae—were likewise in process of formation. Insensibly, from century to century, the planet lost its roughness, the conditions of life were perfected, beings multiplied, differing from the primitive trunk, gaining organs, at first obtuse and rudimentary, but subsequently developed and perfected. It was the

Primordial Age

In which nascent life was represented. Algae, crustaceans and vertebrates yet without heads, appear to have had exclusive possession for 53 hundredths of the time that had elapsed since the earth became habitable. The primary period, which succeeded, is typified by the carboniferous vegetation and the reign of the fishes; to it is assigned 31 hundredths of the time following. The secondary period, during which the splendid conifers dominated the vegetable, and the huge saurian reptiles the animal world, lasted 12 hundredths. Then the earth was swarming with fantastic beings, engaged in perpetual warfare in the midst of the ungoverned elements. Thus I have here, according to the compared thickness of the lands which were deposited during these successive epochs, 96 hundredths of the elapsed time occupied by living forms, absolutely distinct from those which at present embellish our globe—a condition relatively formidable and coarse, and as different from that which we know as if it were that of another world. Who would have then dared to raise the mysterious veil of the future, and foretell the distant time in which man would appear upon the newly transformed planet? During the tertiary period, the mammals and the animals which exhibit more or less physical relation to the human species, succeeded to the inheritance of these primitive ages. The duration of this period did not reach three-hundredths of the total. The quaternary age witnessed the appearance of

The Human Species

And the cultivated trees. This period does not represent one-hundredth of the scale of time. How these magnificent contemplations augment the ideas that we habitually form of nature! We imagine that we ascend very high into the past when we behold the ancient pyramids still standing on the plains of Egypt, the obelisks covered with the mysterious hieroglyphics, the silent temples of Asia, the antique pagodas of

India, the idols of Mexico and Peru, the secular traditions of Asia and of our Aryan ancestors, the instruments of the age of stone, the arms out from silex, the arrows, the spears, the knives, the rapiers and the stone slings of our primitive barbarism. We hardly dare to speak of 10,000, of 20,000 years. But even if we should admit 100,000 years as the age of our species so slowly progressive, what would that be at the side of the apparently fabulous accumulation of centuries which have preceded us in the history of the planet? Allowing but 100,000 years to the

Quaternary Age

(The existing age), we see that the tertiary period must have lasted 300,000 years, the secondary 1,200,000, the primary nearly 3,000,000, and the primordial more than 5,000,000 years. What is this history of life compared to the total history of the globe, which has required 300,000,000 years for the earth to solidify, while its exterior temperature was descending to 200 degrees? And how many millions shall we need to add to represent the time which has elapsed between the temperature of 200 degrees and that of 70 degrees, the probable maximum of organic life? The study of worlds opens to us in the order of time, horizons as immense as those which open to us in the order of space; it causes us to think of eternity as we think of the infinite. * * * We all

Admire the Beauty

Of terrestrial nature—the green hills, the perfumed meadows, the murmuring rivulets, the forests with mysterious shadows, the groves animated by the songs of birds, the mountains crowned with snow, the immensity of the seas, the sun in the west between clouds of gold and carmine, and the sublime ascent of this star above the summit of the mountain, mingled with colors when the first rays of the morning tremble in the gray vapors of the plain. We admire the works of man, which to-day crown those of nature—the bold viaducts thrown from one mountain to another over which peeds the locomotive; the ships, marvelous edifices, which traverse the ocean; the brilliant cities, the palaces and temples, the libraries (museums of the mind), the arts of sculpture and painting, which idealize the real; the musical inspirations, that cause us to forget the vulgarity of things; the efforts of intellectual genius, which investigate the mysteries of nature, and transport us to the infinite. In the midst of this radiant life of which we make a part, we live happy. But all this beauty, all these flowers and all these fruits, will pass away. * * *

The Earth Was Born. It Will Die.

It will die when its vital elements shall have been spent, or perhaps by the extinction of the sun in whose rays its existence is suspended. It may die by the shock of a celestial body which it might meet in its path, but this end of the world is the most improbable of all. It may die, we say, by the slow absorption of its elements. In truth, it is probable that the water and the air are diminishing. The ocean, like the atmosphere, appears to have been much more considerable than at present. The crust of the earth is penetrated by the waters, which combine chemically with the rocks. It is almost certain that the interior temperature of the globe at ten kilometers of depth reaches the boiling point and impedes a further descent of the water; but the absorption will continue with the cooling of the globe. The oxygen, nitrogen and carbonic acid, which compose our atmosphere, appear to suffer likewise a slow absorption.

The Reflective Mind

Can discern through the mist of future centuries the epoch still very distant in which the earth, deprived of the atmospheric vapor which protects it against the glacial cold of space, concentrating to it the solar rays, as in a hothouse, will be cooled as with the sleep of death. From the summit of the mountains the mantle of snows will descend upon the table-lands and the valleys, casting from them life and civilization, and covering forever the cities and nations upon which it may fall. Human life and activity will contract insensibly toward the intertropical zone. St. Petersburg, Berlin, London, Paris, Vienna, Constantinople and Rome, will successively sleep beneath this eternal shroud. The shores of the ocean will be changed, and the geographical map of the earth will be transformed. Life will then be confined to the equatorial zone until the day in which the last tribe shall come to seat themselves, enfeebled by hunger, upon the shore of the last sea, in the forceless rays of a sun whose light will thereafter fall upon an ambulant tomb. Overpowered by the cold, they will be touched with the finger of death and their bones will be forever hidden by the all-involving snows. But perhaps the earth may die only by the extinction of the sun! Our fate would be always the same (would be always death by cold), only it would be longer delayed. The sun

Will Be Extinguished.

It constantly loses its heat, because the energy which it expends it, so to speak, unimaginable. The heat emitted by this star would boil per hour 2900 cubic miriameters of water at the temperature of ice. Almost all this heat is lost in space. The quantity which the planets retain in passing and utilize for their life is insignificant, relatively to that which is lost. If, however, the sun actually condenses with a velocity sufficient to compensate such a loss, or if the rain of aerolites which must fall incessantly on its surface is enough to make up the difference, this star will not yet cool; otherwise, its period of cooling has begun. This is more probable because the spots that periodically cover it can only be regarded as evidence of its cooling. The time will come when these spots will be much more numerous than now, and will begin to cover a considerable part of the solar globe.

From century to century, the spots will gradually increase, but not regularly, because the first fragments of crust, which cover the liquid incandescent surface, will continue to sink, and will be replaced by new formations. Future ages will behold the mighty flames diminish and burst forth again, until the far distant day in which the cooling invades definitively the entire surface of the star and its last intermittent and pallid rays disappear forever. Already we have seen 25 stars sparkling in the sky with a spasmodic splendor, become extinct. Brilliant stars saluted by our fathers have disappeared from the celestial maps; the sun is only a star and must suffer the fate of its sisters. Suns, like planets, are born to die, and in eternity their long careers will be but as the space of a morning. Then the sun, an obscure star, but still calid and electrical, will be an immense world inhabited by strange beings.

The Planetary Tombs

Will continue to revolve around it, until the solar republic in the inexorable transformation gives place to other systems of worlds, to other suns and to other souls. Such is the destiny of the earth and of all worlds. Shall we conclude that with the evanishment of existing globes, the universe will be at some time no more than an immense dark tomb? No! As in the eternity of the past, so it shall be in that of the future. God has been creating eternally, and will not cease to create worlds and beings; in other words, the forces of nature cannot remain inactive. The clashing of the molecules will cause new flames to reappear, and the transmutation of motion into heat will create other nebulae and other worlds. Universal death will never reign.

"Be wise with speed;
A fool at forty is a fool indeed!"

So said Young. Straws show which way the wind blows, and there are a score of symptoms, any one of which shows the existence of catarrh. Neglected, it will rob the blood of its purity and the system of its strength. Get Dr. Sage's Catarrh Remedy. It cures even long-standing cases, as thousands testify, and should be used for colds in the head, which often result in confirmed catarrh.

"O, It Was Pitiful!"

Of course it was! He tried one remedy after another, and finally gave up and died, when his life might have been saved by taking Dr. Pierce's "Golden Medical Discovery"—the great "Consumption Cure"—which, if promptly employed, will soon subdue all threatening symptoms, such as cough, labored breathing, night-sweats, spitting of blood, etc., and restoring waning strength and hope, effectually stop the poor consumptive's rapid progress toward the grave. Is it not worth trying? All druggists.

Its thousands of cures are the best advertisement for Dr. Sage's Catarrh Remedy.

Dr. Charles Rowell's "Fire of Life."—A Valuable and Reliable Testimonial in Its Favor.

The following letter, evidence in favor of that remedy for the certain class of disease to which it is specially applicable, and which is daily becoming more popular, speaks volumes in its favor. The writer is an intelligent and reliable citizen, well known in this community, who not only willingly contributes this testimony in behalf of the remedy named, but requests its publication for the benefit of suffering humanity:

SAN FRANCISCO, July 19, 1887.

Dr. Charles Rowell—DEAR SIR: Since my return from the East, your letter of the 14th inst. making inquiry after the health of my daughter, who was for a long time suffering from Rheumatism in her lower limbs, was received. I have this to say in brief: The young lady, we thought for many months, would never walk again. I employed the best medical skill in the State, and then sent her to several mineral springs. Some of my friends induced me to try your "Fire of Life" remedy. I had no faith in it, but they said: "Give it a fair trial." I did so, and in two months the patient could walk; in six months she never had a rheumatic pain. She is now traveling in Europe and writes me: "The remedy of Dr. Charles Rowell has driven every vestige of pain entirely out of my system." Yours truly,

Baldwin Hotel.

A. C. MORSE.

Money Loaned

On Country Real Estate in large and small amounts at lowest rates, by A. Schuller, 206 Leidesdorff St., room 3.

MAPLE SYRUP!

Of four grades—90c. and \$1 per gallon for good; \$1.40 per gallon, 75c. per one-half gallon, for Strictly Pure; \$1.90 per gallon, \$1 per half gallon, or 50c. per quart for Smith's Green Mountain, which stands at the head of the list. Good Syrups, in barrels, 25c.; in half barrels of 16 gallons, 30c.; kegs, \$1.75, \$2, \$2.25, \$2.50, and

ROCK CANDY DRIPS, \$3

For five gallons. Maple Sugar at 10c.; and Strictly Pure, 15c. per pound. Flour is lower. Coal Oil is lower. If you want a complete outfit of anything at wholesale prices, write for full list right now to

SMITH'S CASH STORE,

115 and 117 Clay Street,

San Francisco, Cal.

SCALDS and BURNS
Should have prompt and proper care or they may prove very dangerous and perhaps FATAL.

ACCIDENTS
are constantly happening. A kick of a horse or cow may cause a bad bruise; the slip of an axe or knife may result in a serious cut.

Any of these things may happen to one of your family at any moment.

Have you a bottle of **PERRY DAVIS' PAIN KILLER** ready for use in such cases? It has no equal for the cure of scalds, burns, cuts, swellings, bruises, sprains, sores, insect bites &c.—All Druggists sell it.

PERRY DAVIS & SON, PROVIDENCE, R.I.

The WHITE IS KING

FOR FAMILY USE,

Dressmaking, Tailoring and General Manufacturing.

IN ITS GREAT RANGE OF WORK IT STANDS WITHOUT AN EQUAL.

THE LIGHTEST RUNNING,
THE MOST DURABLE,
THE FINEST FINISHED,

120 Front St., San Francisco.

Vine-Growers' Meeting.

At the meeting of the Grape-Growers' and Wine-Makers' Association in this city, on August 16th, President H. W. McIntyre presided.

Discussion on Legislation.

After the reading and adoption of the minutes, Mr. Secretary Rixford read the following communication:

An Invitation.

To the California Wine-Makers' and Grape-Growers' Association—GENTLEMEN: A large number of the growers in the San Francisco viticultural district desire to consult with their members of Congress on the subject of the practicability of securing favorable legislation in Washington to protect genuine wines against unrestricted competition with spurious compounds. This desire comes especially from the Santa Clara and Livermore valleys, and, no doubt, is participated in by all the public-spirited citizens of the State. For this reason I have been induced to call a special meeting of this district, to be held at the offices of the State Viticultural Commissioners, unless otherwise advertised, in due time, on Wednesday, August 24th, at 11 A. M. The secretary of the State Commission will invite all members of the delegation in Congress to be present, and will also invite on behalf of this district all members of the State Commission and all viticultural associations and persons engaged in viticultural pursuits throughout the State to participate in the consultations. All members of the Grape-Growers' and Wine-Makers' Association are especially invited to be present. Respectfully yours,

CHARLES A. WETMORE,
Commissioner for the S. F. Viticultural District.

The invitation was accepted with the understanding that the members attend as individuals and not as representing the association.

Another Invitation.

The secretary read the following communication:

MENLO PARK, Aug. 15, 1887.

E. H. Rixford—DEAR SIR: The Santa Clara Viticultural Society has appointed a committee of its members to have a conference with our congressional delegation on Wednesday, the 24th inst., on the subject of congressional legislation. We would be glad to have the State organization, of which you are secretary, appoint a committee to attend. The meeting is not intended to be deliberative, but for information and exchange of ideas. I proposed extending this invitation personally at the meeting today, but find myself scarcely well enough to leave home.

JOHN T. DOYLE,
Chairman Committee.

The meeting accepted the invitation.

Adulterations.

Considerable time was given to the discussion of a proposed "pure grape wine" introduced by a gentleman from Ohio who was present. The project was found to be untenable by California wine-producers, as it was intended to cover the addition of spirits not derived from the grape—a thing which is incompatible with the California idea of pure wine. Finally the following resolutions offered by Mr. Wetmore were adopted:

Resolved, That a committee of five be appointed to prepare a report on the following subjects:

First—The nature and extent of the production and trade is spurious, compounded and adulterated wines or imitations of wine in the United States.

Second—The effects of such trade on the legitimate commerce in pure wines and upon the health of the consumers.

Third—The remedies that may be applied against these evils by national legislation.

Fourth—The remedies that may be applied by State Legislatures.

Fifth—The remedies that may be applied through popular action.

Resolved, That the committee shall consider any and all proposed measures relating to national legislation which shall be referred by this association, and shall report to a special meeting to be called by the president at some time before the 1st day of next December, and shall co-operate as far as practicable with the State Viticultural Commission and the National Viticultural Association.

The committee will be named later.

Coulure.

Prof. Hilgard addressed the association at length upon the prevalence of "coulure" in vineyards. The term implies imperfect or arrested development of the fruit, and he exhibited two specimens. The members each gave their experience with reference to this matter, making it appear that the difficulty arose from local causes, and was entirely beyond the control of the vineyardist. The matter will be treated by Prof. Hilgard in a future University Bulletin.

After the adoption of resolutions of respect to the memory of the late Senator Sargent, the association adjourned.

THE HAWAIIAN EXCURSION.—The letter published on our fourth page this week closes the interesting series, describing the visit of the Masonic party to the Islands, with which Mrs. Johnston has been favoring the Press and its patrons. Our correspondent brought home with her a number of photographic views, illustrative of the land and people visited, which she has kindly placed at our disposal; and we hope soon to reproduce a portion of them for the benefit and entertainment of our readers.

CALIFORNIA FRUIT FOR OREGON.—The steamship State of California, on her last trip up, took 300 tons of fruit, ship measurement. Captain Debnay says it was the largest amount that any steamer ever carried to Portland. Towns in all parts of Oregon, that a few years ago did not buy a case of California fruit, now order 40 and 50 boxes from every steamer.

The Fruit Product.

"The fruit season thus far," said Secretary Lelong, of the State Board of Horticulture, "has been eminently satisfactory to the fruitmen of this State. The trees have been in splendid condition generally, though in a few places the orchards have suffered severely from pests. These have created considerable damage where prompt remedies were not resorted to; yet the total destruction of fruit from pest has been inconsiderable when compared with the large production. I may say that every effort is being made by horticulturists generally to resist the spread of fruit pests. Every method suggested by reliable scientists and fruitmen is being thoroughly tested. Usually not much urging is required to induce the owners of pest-ridden orchards to try the latest discoveries, as they are only too willing to attempt the eradication of their insect enemies; in this way many new applications are being discovered.

Production of Fruits.

"The production of fruits will be greater this year than ever before. In the older fruit-growing sections of the State many of the old orchards are being replanted, and the new growths in those regions, as well as the more recent plantations, show vigorous bearing that speaks well for future production. I think that the next few years will witness an enormous fruit product, and this will be encouraged to an almost incalculable extent when it becomes more fully known to the farming community that with a largely increased output every year the prices grow more satisfactory. This is accounted for by the fact that better classes of fruits are grown, and these are in great demand by canners and for Eastern shipments. People in the Eastern States and in Europe, for that matter, realize that superior quantities of fruits are being raised in this State. Some years ago they did not know this, as dealers could not transport our horticultural products in their green state easily, or for a reasonable price. This is now being accomplished and a large market beyond the Rocky mountains opened up to our producers. It is now possible for people of limited means and living several thousand miles from us to eat our luscious fruits for a price not much beyond what is now paid here. Of course, in Europe, only persons of some means can purchase our fruits, and then principally in a canned state.

Shipments to Europe.

"I confidently believe that the time is not far distant when we will ship green fruits to Europe. Canners obtain a great deal of fruit for preserving and this makes our local market short, still the demand is met without much difficulty.

Increase in Dried Fruits.

"Another feature of the fruit business in this State is the vast quantity of fruits that are dried. No conception can be formed of the magnitude of these drying operations, which are yearly increasing. Fruits of all sorts that are bright and clean-dried bring better prices than when fresh, besides, they have the advantage of keeping for any length of time. Dr. Kimball of Haywards has just dried about 100 tons of apricots, nearly his entire crop, and all are in first-rate condition. The favorite method of drying is by the sun process, which is better and cheaper than any artificial method; but few fruit-driers have given the desired satisfaction. But little fruit is being crystallized, owing to the limited market for such sweets and the increased expense incident to its manufacture.

"In every respect the fruit interests of the State are prospering, and the outlook could hardly be brighter. If we can succeed in checking the ravages of the pests, this State is bound to become the orchard for the world."—*Morning Call*.

Partial Statistics of California Horticulture.

The Secretary of the State Board of Equalization has compiled the following viticultural statistics from the reports of the assessors of every county in the State:

Total number of acres in vines in Alameda county, 3451; Amador, 846; Butte, 247; Calaveras, 1440; Colusa, 506; Contra Costa, 3000; Del Norte, 4; El Dorado, 1570; Fresno, 10,185; Inyo, 95; Kern, 45; Lake, 985; Los Angeles, 17,000; Marin, 493; Mariposa, 500; Mendocino, 108; Merced, 514; Monterey, 500; Napa, 14,431; Nevada, 235; Placer, 2221; Sacramento, 8465; San Benito, 110; San Bernardino, 9165; San Joaquin, 1793; San Luis Obispo, 275; San Mateo, 625; Santa Barbara, 527; Santa Clara, 9423; Shasta, 147; Siskiyou, 4; Sonoma, 21,683; Stanislaus, 498; Sutter, 430; Tehama, 4972; Trinity, 20; Tulare, 1229; Tuolumne, 890; Ventura, 800; Yolo, 3191; Yuba, 165. Total, 121,440 acres.

The Trees in the State.

Entire number of fruit trees growing in Alameda county, 366,410; Alpine, 900; Amador, 89,710; Butte, 131,814; Calaveras, 931,620; Colusa, 79,818; Contra Costa, 141,619; Del Norte, 6018; El Dorado, 249,249; Fresno, 370,477; Humboldt, 40,321; Inyo, 14,440; Kern, 54,000; Lake, 85,548; Marin, 41,907; Mariposa, 11,157; Mendocino, 46,200; Merced, 51,175; Modoc, 20,227; Mono, 400; Monterey, 16,350; Napa, 287,265; Nevada, 122,238; Placer, 359,609; Sacramento, 484,045; San Benito, 68,100; San Bernardino, 100,015; San Diego, 91,148; San Joaquin, 123,471; San Luis Obispo, 83,

625; Santa Barbara, 19,742; Santa Clara, 1,365,735; Shasta, 81,587; Sierra, 4000; Siskiyou, 63,944; Sonoma, 656,367; Stanislaus, 38,000; Sutter, 144,546; Trinity, 12,252; Tulare, 427,000; Tuolumne, 15,000; Ventura, 325,000; Yolo, 1,254,464; Yuba, 116,554.

Owing to the neglect of the assessors in some of the counties to report upon the acreage in grapes for wine and table purposes, the list is not complete in that particular. Thus far 13,760 acres of table and 59,036 acres of wine grapes have been reported from over 40 counties.

Fairs to Come.

Sonoma Co. Agricultural Park Assoc., Santa Rosa, Aug. 22 to 27.
Fourth Dist.—Sonoma and Marin—Petaluma, Aug. 29 to Sept. 3.
Eighth Dist.—El Dorado—Placerville, Aug. 30 to Sept. 2.
Thirteenth Dist.—Sacramento, Yolo, Yuba and Sutter—Marysville, Aug. 30 to Sept. 2.
Mechanics' Institute, San Francisco, Sept. 1 to Oct. 8.
First Dist.—Alameda, Contra Costa and S. F., San Francisco, Sept. 5 to 10.
Third Dist.—Butte, Colusa and Tehama—Chico, Sept. 6 to 10.
Seventeenth Dist.—Nevada and Placer—Grass Valley, Sept. 6 to 10.
Shasta Co.—Redding, Sept. 7 to 9.
California State, Sacramento, Sept. 12 to 24.
Oregon State, Salem, Sept. 12 to 17.
Los Angeles Co. Pomological, Los Angeles, Sept. 12 to 17.
Nevada State, Reno, Sept. 21 to Oct. 1.
Second Dist.—San Joaquin, Stanislaus, Merced and Tuolumne—Stockton, Sept. 26 to Oct. 1.
Ninth Dist.—Humboldt and Del Norte—Rohnerville, Sept. 27 to 30.
Nineteenth Dist., Santa Barbara, Sept. 27 to 30.
Tenth Dist.—Siskiyou, Trinity and Shasta—Yreka, Sept. 28 to Oct. 1.
Santa Clara and San Mateo—San Jose, Oct. 3 to 10.
Sixth Dist.—Los Angeles, San Bernardino and Ventura—Los Angeles, Oct. 3 to 8.
Eleventh Dist.—Plumas, Lassen, Modoc and Sierra—Susanville, Oct. 3 to 8.
Seventh Dist.—Monterey and San Benito—Salinas, Oct. 4 to 8.
Twenty-Sixth Dist.—Amador and Calaveras—Ione, Oct. 5 to 7.
Portland Mechanics' Fair, Oct. 6 to 22.
North Pacific Domestic and Fat-Stock Assoc., Portland, Or., Oct. 9 to 17.
Fifteenth Dist.—Tulare and Kern—Visalia, Oct. 10 to 15.
Sixteenth Dist., San Luis Obispo, Oct. 12 to 15.
Twelfth Dist.—Lake and Mendocino—Ukiah, Oct. 11 to 15.
San Diego Co. Horticultural and Agricultural, Oct. 28 to 30.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 210 Market St., S. F.

FOR WEEK ENDING AUGUST 9, 1887.

368,130.—MAGAZINE GUN—Howard Carr, S. F.
367,786.—PIPE WRENCH—E. O. Carvin, Corvallis, Or.
368,074.—BALING PRESS—T. J. Corning, San Jose, Cal.
367,965.—BRAKE—Henry Dewey, Plainsburg, Cal.
367,899.—RELIEF PICTURE AND FRAME—J. W. Eckert, Oakland, Cal.
367,801.—GAS REGULATOR—A. Ford, S. F.
367,907.—FIRE ESCAPE—Ole Hansen, Walnut Grove, Cal.
367,909.—GEAR MECHANISM—Wm. Hanson, Calistoga, Cal.
367,975.—WINDMILL—M. V. Harper, North Yakima, W. T.
368,154.—DENTAL ENGINE BRACKET—W. A. Knowles, S. F.
367,918.—CENTRIFUGAL PUMP—I. P. Lambing, Ione, Cal.
367,919.—CENTRIFUGAL PUMP—I. P. Lambing, Ione, Cal.
368,007.—FUNNEL—Chas. Rehn, S. F.
368,019.—BEAM CONNECTION—Sims & Morris, S. F.
367,938.—PURIFYING BEVERAGES—Soms & Weiss, S. F.
368,117.—SHINGLE-SHAPING MACHINE—A. T. Stimmon, Eureka, Cal.
368,178.—DEVICE FOR CUTTING VEHICLE AXLES—O. Whitmore, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

THE "AURORA," a family magazine born in this city with the year 1887, has completed its first volume and fairly entered upon the second. One of its features is that each number is complete in itself, there being no continued stories. Another is its cheapness, yearly subscriptions being but \$1.50 and single numbers 15 cents. The pages of the August number, which lies before us, embrace fiction and verse, essays on topics concerning culture, health and manners, sketches of travel, studies in biography, etc., presented in a style of typography that does not suffer in comparison with higher-priced periodicals. Bacon & Co., 508 Clay St., S. F., are the publishers.

WIFE—Now you have bought a cow, who will milk it? Husband—Oh, he says the calf does that. So we'll have all the milk we want.

ALL signs fail in dry times—except winks.

INTERESTING TOPICS.—The University Bulletin, which we publish on another page of this issue, treats of two very interesting topics. One is the quality of beets grown in Fresno county. As Professor Hilgard states, the subject involves several new and important considerations, both in the sugar value of the beets and the industry of sugar extraction. These facts, in connection with the remarks which we made in last week's RURAL, would indicate the probability of considerable life in the beet-sugar interest of the State. Another subject which interests people in the district north of the bay chiefly will be the observations on the Hessian fly. We trust that the information asked for will be secured from a number of growers in the fly-infested districts, so that a report giving a comprehensive discussion of the occurrence of the pest in California can be prepared. Fortunately, only a narrow region is now infested, and it is to be hoped that either natural unfitness of our climate or our methods of grain-growing may always keep the evil within narrow limits.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, to those who pay fully one year in advance of date, IF REQUESTED the following articles (while this notice continues), at the very greatly reduced figures named at the right:

AGRICULTURAL BOOKS.

Sold by Dewey & Co., Publishers "Pacific Rural Press."

CALIFORNIA FRUIT GROWER.—A practical Handbook for the orchardist (in preparation).
CATALOGUE OF EUROPEAN VINES.—With synonyms and brief descriptions, by I. Blandsale, D. D. Invaluable to those growing the vinifera. Price, in pamphlet, 50 cents.

ORANGE GROWING IN CALIFORNIA.—By T. A. Garey, of Los Angeles. The most comprehensive treatise on the growth of this fruit. It contains full instructions for growing the trees, planting and care of orchards, etc.; 227 pages. Price, 75 cents.

SILK GROWERS' MANUAL.—By W. B. Ewer, A. M. A practical treatise full of useful hints for beginners in this State; 20 pages. Pamphlet, price 25 cents.

FRUIT GROWERS' CONVENTION REPORTS.—These annual conventions have resulted in bringing out the best and most useful information concerning the growth of different fruits in this State. The subjects discussed are of the most direct practical value and the facts laid down will prove helpful and suggestive to all in the fruit business. We have the reports of 1881, 1882, 1884, and 1885—the first for 10 cents, the others at 25 cents each.

THE AGRICULTURAL FEATURES OF CALIFORNIA.—By Prof. Hilgard, 138 large pages, bound in stiff cloth, with colored maps, \$1. This book is the best general review of California soils, climate and productions in existence.

NILES' STOCK AND POULTRY BOOK.—Pamphlet, giving directions applicable to poultry growing in this State; 120 pages, post-paid for 60 cents.

KENDALL'S TREATISE ON THE HORSE AND DISEASES.—Post-paid for 25 cents.

ARCHITECTURE SIMPLIFIED OR HOW TO BUILD A HOUSE.—Contains plans and amounts of materials for a number of buildings from a little cottage to a large dwelling. Price, five cents.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 75 cents; postage, 10 cents. Postpaid to subscribers of this paper, 50 cents. Send for illustrated circular. Agents wanted.

We have a choice collection of imported registered Stallions on hand and for sale, unsurpassed for quality, breeding and prices. Call and see them, or write for further information.

SUMMER SONGS, AUTUMN MELODIES, WINTER ANTHEMS, SPRING CAROLS,

By the thousand and hundred thousand, are found on the shelves of our great music stores. If not "bursting into song," they are at least fully weighted with the best and most popular music of the day.

It is in vain to give any idea of the wealth of our Sheet Music catalogue by any series of advertisements. Persons wishing to select will please send for lists or catalogues, or call at the "Ditson" stores (Boston, New York or Philadelphia), or examine the music with Ditson & Co.'s imprint in any respectable music store.

New music and books are faithfully and accurately described in Ditson & Co.'s **MUSICAL RECORD**, a monthly costing but \$1.00 per year, which dollar is amply repaid to every music purchaser in the information conveyed by the good Vocal and Instrumental music and well-made reading columns of this monthly magazine.

We mention, as prominent Music Books to be used the ensuing season: **Jehovah's Praise** (\$1.00), a fine Church Music Book by Emerson. **New Spiritual Songs** (35 cents), by Tannev & Hoffman, and the **Children's Psalm** (35 cents), a new and very bright Sunday School Song Book.

OLIVER DITSON & CO., Boston.

C. H. DITSON & CO., - 867 Broadway, New York.

BOOMING!

The Celebrated Dr. Fisherman's Carbolized Alkaline Lotion,

TWENTY-SECOND INDUSTRIAL EXHIBITION AND MECHANICS' FAIR.

SAN FRANCISCO, 1887.

Opens September 1st, closes October 8th

The Trustees of the Mechanics' Institute take pleasure in announcing that the coming Exposition promises to be the most attractive and important to the producers of this State of any yet given.

Several Counties have already applied for space to make a general exhibit of their resources, and it is now an assured fact that the whole of the immense pavilion, with its annexes, will be filled with California's choicest productions, both natural and manufactured.

An Orchestra of 50 celebrated soloists and musicians, under the leadership of the celebrated Trombone Virtuoso, Fred N. Innes, has been engaged, and will perform each afternoon and evening.

The immense Art Galleries will be filled with choice works of Painting and Sculpture; the Machinery Hall and the Agricultural Machinery and Implement Department will contain the best and latest inventions in mechanic art.

Intending Exhibitors should lose no time in applying for Space.

Liberal Premiums in Each Class will be Awarded.

No Charge for Space, Steam or Power.

PRICES OF ADMISSION—Double Season Ticket, \$5; Single Season Ticket, \$3; Adult's Single Admission, 50 Cents; Children's Single Admission, 25 Cents.

Season tickets to members of the Institute at half price.

Full information given or sent on application to the office, 31 Post Street.

A. W. STARBIRD,
Secretary.

P. B. CORNWALL,
President.

Lands For Sale and To Let.

Glen Cove Rancho for Sale.

This Rancho is situated at tide-water on the north shore of the Straits of Carquinez in Solano County, and comprises about 415 acres of good grain land. It is fenced and cross-fenced with five-board fence, and is well calculated for fruit raising. Has a young orchard of upward of 700 trees now well started; also a vineyard of 7000 vines of wine-producing grapes. The improvements consist of a large barn covering an area of 30x60, with 15-foot stables on either side; also a warehouse 30x60 for storing grain (with wharf) at tide-water, thus saving the expense of hauling grain for shipment. A wagon-house, a conservatory, sheds for storing machinery, hen-houses and inclosed yards, with a modern-built, two-story house with mansard roof and cellar under the whole structure, resting on an 18-inch stone wall; has 15 large, fine rooms, hard-finished walls, furnished with hot and cold water from two large cisterns and a spring upward of 100 feet above the house. Has a fine garden and pleasant surroundings; is about 30 miles from San Francisco and four miles from Vallejo or Benicia, with good roads by land and a pleasant sail by water. The prospective railroad from Santa Rosa to Benicia is expected to pass directly in front of the place, and a flag station is promised by said railroad company. The soil is of a rich loam and very deep. In point of health and climate no section of the State can surpass it. The live-stock and the farming implements will be sold, if desired, at very low figures. A rare opportunity is offered for any one who wants a very desirable place at a very favorable price. For further particulars apply on the premises or address, JOHN F. DEMING, Vallejo, Solano Co., Cal.

WEST COAST LAND CO.

TEMPLETON, SAN LUIS OBISPO CO., CAL.

Home of Wheat, Fruit, Wine and Olive; 15,000 acres sold in past 3 months to 220 settlers, representing a population of 1100; 49,000 acres—small subdivisions—average, \$22.50 an acre; 4 cash, balance 5 years, 6 per cent. Catalogues and maps free. C. H. PHILLIPS, Manager.

S. F. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, August 17, 1887.

The past week witnessed continued activity in fruits, with heavy receipts causing a glut in some varieties. Advices from the country report most of the farmers busy delivering wheat so as to take advantage of any movement that may occur. Eastern telegrams have reported a fairly steady market the past week in wheat, with an advance in corn. London cables have generally been discouraging—weak, easy with lower quotations, the fine harvest weather being against the market. To-day's cable is as follows:

LIVERPOOL, Aug. 17.—Wheat—Quiet but steady. California spot lots, 6s 6d to 6s 9d; cargoes off coast, slow; on passage, inactive; Mark Lane wheat, turn easier; French country markets, mostly turn cheaper; wheat and flour on passage to U. K., 1,948,000 qrs; wheat and flour in Paris, quiet.

Foreign Review.

LONDON, Aug. 15.—The *Mark Lane Express* in its weekly review of the British grain trade, says: With the exception of a few slight showers, the drought has not been broken. In the greater part of the kingdom, the days have been 15 degrees hotter and the nights are autumnal. Vegetation appears to be giving out. Wheat deliveries have been numerous and values continue to decline. If the weather keeps dry, lower rates appear to be inevitable. The sales of English wheat during the week were not reported. The average price in London for the week ending Tuesday was 34s on 504 quarters. The flour trade is depressed. Some new barleys have been offered. Their color has been good and their quality various. In foreign wheat there is no fresh feature; the values are gradually declining. The interest appears to be confined to the native crop, or rather the condition in which it can be delivered. The outcome of the wheat corner in San Francisco is not yet determined, and there is therefore an accumulation of California wheat in Liverpool which threatens trade. In off coast trade prices have declined 1s 1d to 1s 9d. Seven wheat cargoes arrived; 2 were sold, 4 withdrawn, 6 are waiting orders and 5 remained. Barley has declined. At to-day's market plenty of new wheat was offered at 1s shilling lower. Some kinds of foreign wheat were unchanged in prices, while others were sixpence to a shilling lower. American flour was sixpence cheaper; country flour was scarce and quiet. Grinding barleys were eightpence lower.

Crops at the East.

CHICAGO, Aug. 14.—The *Farmers' Review* says: Copious rains fell quite generally throughout the West last week, refreshing the parched pastures and invigorating the growing crops. The rains unfortunately came too late to materially benefit the corn, and had little effect for good except on late planted or low-lying fields. Much more rain will be required to put pastures in good fall condition and replenish the sources of stock water.

WASHINGTON, Aug. 14.—The following is from the weather and crop bulletin of the Signal Office for the week ending August 13: The drought previously reported in the corn belt in the central valleys has been followed by general rains, and the conditions existing this morning indicate that rain will continue in this section, but reports from Ohio, Indiana, Illinois, Missouri, Nebraska and Kansas, state that the rains come too late to cause any marked improvement in the already injured crops. The weather has been generally favorable for all crops in the States on the Atlantic Coast, from Georgia northward to New England, and reports from Mississippi, Arkansas and Alabama indicate that the weather for the past week has been favorable for the cotton crop, although the crop needs more rain in portions of Tennessee and Arkansas.

Eastern Wheat Markets

NEW YORK, Aug. 14.—The close was firm at 79c for Sept., 80½c for Oct., 80½c for Nov., and 83½c for May.

NEW YORK, Aug. 17.—12 M.—81½c for cash, 80½c for Sept., 81½c for Oct., and 82½c for Nov.

CHICAGO, Aug. 17.—1 P. M.—Wheat firm; cash, 68 1/2-16c; Sept., 69 1/2-16c; Oct., 71c.

California Fruit in New York.

NEW YORK, Aug. 12.—The sale of two carloads of California fruit to-day was a complete success. The attendance increases with every sale. Thirteen hundred packages were sold. Bartlett pears, \$3@3.75; Duchess and B. diel pears, \$2.62½@2.95; Gros pears, \$2.20; Hungarian pears, \$1.85@2.20; Columbia plums, 60¢@65¢; Orange Cling peaches, \$1.90; Early Crawford peaches, \$1.15@1.20. There was much decay in plums, but other fruit arrived in excellent condition.

NEW YORK, Aug. 14.—Canned Goods—The demand for all descriptions is satisfactory. California Bartlett pears, \$3 to \$3.25. Dried Fruits—Jobbing houses report an increased demand. The tone of the general market is steady; raisins are selling fairly in small quantities, though interest is shown chiefly for California and Valencia. California loose Muscatel, 2-crown, \$1.10 to \$1.20; 3-crown, \$1.35 to \$1.40; London, \$1.35. California dried apricots are in good demand, selling freely at 16¢@16½¢.

NEW YORK, Aug. 16.—The *Commercial Bulletin* says: Raisins are selling well in jobbing quantities. Currants are yet held at 5¢@6¢.

California Fruit at Chicago.

CHICAGO, Aug. 12.—Receipts of California fruit continue fair. The market is steady and firm, and shows a good demand, with little change in prices. Muscatel and Tokay grapes, \$2.75@3; Crawford, Orange, Cling and Susquehanna peaches, \$1.25@1.50; Bartlett pears, \$2.75@3; Beurre Hardy pears, \$2.12½@2.25; Gros pears, \$1.25@1.50; German pears, \$1.50@1.75. Egg plums, \$1.25@1.50.

Dried Fruits—Peaches are about the only line of fruit coming, and meet with very fair demand. Plums are waited for and there is quite a little demand. Pitted plums, evaporated, 10½¢@11¢; pitted

plums, sun-dried, 10¢@10½¢; apricots, evaporated, future delivery, 14½¢; do. cash, 15¢@15½¢; raisins, London layers, 20-lb boxes, \$1.40@1.50; do. loose Muscatel, \$1.25; do. Calif. layers, \$1.25.

CHICAGO, Aug. 16.—A carload of fruit arriving to-day from California consisted almost wholly of peaches and pears, which were in good shape and for which there is a very good demand, with prices steady. The following prices were received to-day for fruit in strictly first-class order, that in bad shape selling for considerably less: Late Crawford, Susquehanna and Orange Cling peaches, \$1.50@1.60; Bartlett pears, \$3@3.25; Beurre Hardy pears, \$2.25; Duchess pears, \$1.50@2; Tokay and Muscatel grapes, double crates, \$3.75@4; German prunes, \$1.25@1.60; Gros pears, \$1.25@1.50.

Dried Fruits—Apricots are almost the only kind of new fruit coming in and arrivals continue moderate. Plums are entirely out of the market. Raisins are becoming scarce and under a good demand prices have advanced. Apricots, evaporated, future delivery, 14½¢@15¢; do. cash, 15¢; raisins, London layers, 20-lb boxes, \$1.40@1.50; do. good Muscatel, \$1.35; do. California layers, \$1.35.

Eastern Hop Markets.

NEW YORK, Aug. 13.—The S. S. Eider, yesterday, brought the first new Bohemian hops, which are of a very fine quality. There is no apparent change in the attitude of buyers or sellers, and the market continues dull. Some 200 bales of fair quality, 1886 Pacifics, were placed at 13c, and others were said to have been offered as low as 12c. Coist crop of 1886—Best, 18c; common to good, 13¢@16¢; 1885—Good to prime, 8¢@10c.

Eastern Wool Markets.

BOSTON, Aug. 13.—Demands of manufacturers have been active this week and large sales of both foreign and domestic grades have been made, amounting to 3,618,100 lbs. The late decline in prices has induced buyers to take hold. There is a much better feeling in the market and dealers look for an active demand and large sales at present quotations. All kinds of wool are feeling the improvement. Sales embraced 231,000 lbs California spring at 18¢@21c, 55,000 lbs Oregon at 18¢@19c, and 547,000 lbs Territory at 17¢@24c. Total sales for the corresponding week last year were 2,993,400 lbs.

NEW YORK, Aug. 14.—The market continues dull, though buyers made no special objection to ruling rates. Among sales were 2500 lbs Eastern Oregon at 20¢@24c, 20,000 lbs Territory at 21¢@23c.

In the Philadelphia markets the demand continues moderate and the situation is unsatisfactory all around. Among sales are 13,000 lbs Territory fine at 19c, 6000 lbs Territory at 25c.

Local Markets.

BAGS—The market is irregular, with only a fair demand ruling at 6½¢ to 7½¢ cts.

BARLEY—Heavy receipts have depressed the market still further, although toward the close more inquiry is reported from speculators and consumers. The consumption in the State continues largely in excess of any former season. Call Board will resume business on Monday next.

BUTTER—The market is not only strong and higher, but has an advancing tendency under a good demand and strong holding.

CHEESE—The market continues to rule strong at full prices. The stock is not excessive for the season.

EGGS—The market for all kinds shows a slight advance. Strictly choice fresh laid are said to have been sold at over 30 cts., but this is disputed by the trade.

FLOUR—The market is steady at full prices.

WHEAT—No Call Board this week, consequently buyers and sellers are at a deadlock pending the resumption of business in futures, on next Monday. All kinds of rumors and reports are set afloat, but so far as can be ascertained are not reliable. Owing to the unsatisfactory condition of the market, large holders are not offering their wheat on the market.

[COMMUNICATED.]

Market Information.

Cereals.

The past week was dull, inactive, due to the peculiar situation in which both buyers and sellers find themselves. The Call Board transactions have regulated, to a certain extent, if not entirely, values for spot or cash wheat, and now operators are indisposed to doing anything, preferring to await developments when the directors of the Call Board authorize the resumption of business on Call. There is very little choice wheat offering for sale. Samples received called choice turn out to be only fair, or else having a large share of red grain in it. The grain appears to be more irregular this year than for several seasons past. Millers report considerable difficulty in getting choice milling wheat at \$1.75, although some fair was sold for less. Dealers say that the market is a deadlock; holders of No. 1 white shipping want \$1.70, while buyers will not bid so much. Large holders are storing and get \$1 advanced, believing that it is only a question of short time when short sellers will have to pay that price, if not more. It is claimed that fully ten ships were chartered the past week to load wheat for the United Kingdom. The charterers were John Rosenfeld and William Dresbach.

The London *Millers' Gazette* of July 25 says that the reports received from the country at the opening of this week stated that the wheat crop has made considerable further progress toward maturity, and that the harvest would probably commence in the first week of August, which is later than usual. It must, however, be added that with regard to the relative state of forwardness of the wheat crop, there is considerable variation in the reports received from the different districts; in some of them the crop is stated to be about as forward as usual, owing to the long spell of forcing weather we have had, while in other parts of the country the harvest promises to be several weeks in arrear of the ordinary time. There is reason to believe that the yield will, upon the whole, be very good, but in this respect there appears to be likewise very great disparities, according to the nature of the soil. The same remark is made in the reports from France, where the heat has been very prejudicial in some localities, however favorable it has been in others, so that nothing more than a fair or good average yield seems to be expected.

The prospects of the spring corn crops in the United Kingdom, as well as in France, are by no means satisfactory, owing to the drought; and it is feared that the potato crop will be very small in England, although in Scotland it is favorably spoken of. Early this morning, however, a considerable quantity of rain fell in the London district, which will be much appreciated. In Germany the wheat and rye crops give good promise in the most important districts of the empire, but spring corn, and more especially oats, are expected to be decidedly deficient in many parts of the country.

Revised estimates of the world's wheat crop are considerably below the estimates of a fortnight ago. It now looks as if there will be a shortage compared with last year, owing to the large decrease in the United States and India.

As the maturing corn crop is attracting considerable attention, and the reports of serious damage by drouth and extreme hot weather have been received from various sections of the country with sufficient freedom to greatly enlarge speculative trading, the following figures are presented, based on reports furnished by the Department of Agriculture. It should be understood that a full average corn crop in the United States represents 27 to 28 bu. per acre. The condition reported August, 1886, was 81 per cent, and the yield per acre was about 22 bu. On this basis a full average crop would be about 27.16 bu. per acre. The September report, however, made the condition 76.6 per cent, but returned the aggregate yield larger—1,665,441,000 bu., and the area planted 75,694,208 acres. This would make the average about 28.70 bu. for a full crop. Taking the average of these two statements, the yield of a full crop would be 27.93 bu. and would have made the aggregate crop of 1886, if it had been a full one, 2,114,133,000 bu. The Department of Agriculture reports an increase in the area for 1887 of 2,300,000 acres, or a total of 78,000,000 acres. At an average of 27.93 bu. per acre, a full aggregate crop would be 2,178,540,000 bu. But on the basis of the condition reported for August by the Department of Agriculture—80.7 per cent—the yield would be about 1,758,182,000 bu., or 420,358,000 bu. below a full average crop. Since the report of the Department, agricultural returns from the corn-growing States are still worse, so that it is not at all likely the total yield will be 1,500,000,000 bushels against about 1,750,000,000 bushels last year.

The local corn market has ruled strong throughout the week, in sympathy with higher prices at the East. The demand is steady.

Barley, under heavy receipts and a strong selling pressure, ruled in buyers' favor throughout the week. Considerable was purchased for shipment to the southern interior counties, where the consumption is largely increased. It is claimed that higher prices will obtain as soon as the Call Board resumes business. Advices from the East and also Canada report the crop not up to expectations both in yield and quality.

Oats are in free supply, with prices favoring buyers. The consumption, at the lower prices, is increasing.

Both rye and buckwheat are unchanged.

Fruits.

The market is still glutted with peaches, plums, pears and apricots, although the latter do not appear to be in such liberal supply as the other three. Much of the fruit coming in is too ripe for keeping, consequently they are forced on the market for the best prices obtainable. Canners are still buying. Prunes are quickly taken at quotations. Nectarines are hardening under light supplies. Choice apples find a ready market, but inferior are hard to sell even at the lower quotations. For berries the market is gradually hardening under lessened supplies and a continued good demand. Canners are still buying.

The daily papers quote lower prices for dried fruits, but as only figs, peaches and apricots have come in in sufficient quantity to allow quoting, it is hardly safe to fix prices for the others. Dried peaches and apricots are very strong and fetch high prices, for both home trade and shipping to the East. The supply at the East will be short this year, consequently they are eager buyers of California dried fruits.

In raisins there is nothing of special interest to note. The market is very stiff for future delivery under a good demand from the East, where California raisins are growing in favor owing to their superior keeping quality. One box of this year's make was received the past week, but no regular consignments are looked for, for several days yet.

Feedstuff.

Hay continues to come forward sparingly, causing a strong market to rule. It is now very generally conceded that the crop output is considerably below the consumptive requirements, provided a bad winter is had. Even with a moderately mild winter the supply will hardly meet the wants of consumers.

Brans and middlings under freer receipts have sold for less money, with, at the close, a weak tone. The demand is reported to be good, but not up to last year, owing to more ground and rolled barley being used. In other feedstuff no changes are reported.

Live-Stock.

Beef cattle, mutton sheep and live hogs are essentially unchanged, the market continuing in buyers' favor, under free offerings. Dressed hogs are weak at quotations. Last week's report covers this week's market advices. For calves the market continues to rule firm.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7c; first grade, grass fed, 6¢@6½¢ per lb.; second grade, 5½¢; third grade, 4½¢@5½¢.

LAMB—Ewes, 5½¢@6c; wethers, 6¢@6½¢.

MUTTON—Spring, 7¢@8c.

VEAL—Large, 6¢@7c; small, 6¢@8c.

PORK—Live hogs, 4½¢@4¾¢ for heavy and medium; hard dressed, 7¢@7½¢ per lb.; light, 4½¢@4¾¢; dressed, 7¢@7½¢; soft hogs, live, 3½¢@4c.

On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Honey.

The market is very strong at another advance. The *Chicago American Bee Journal* of Aug. 10th says: We have several times cautioned those having any honey to sell to hold back for the advance in prices, which must surely come very soon. In reference to this matter, Mr. S. F. Newman of Norwalk, O., writes as follows: The honey crop in this

section is almost an entire failure. Probably about one-tenth of a crop has been gathered. There is no question as to the advance in price. It certainly will reach 20 cents in 60 days. What little hope there was for a fall crop is daily dwindling. The extremely hot and dry weather has "burnt up" almost everything, and all crops are suffering, and prices of every crop are advancing. Do not sell any honey until the end of September, is the best advice that can be given. Really, this year's crop of honey is but little, if any, more than will be required for winter stores for the bees, if used for that purpose. Prices should be doubled at least within two months.

Vegetables.

Potatoes continue to come in very freely. The crop in this State is larger than last year. The quality is also greatly improved. Prices, except extra choice, favor buyers.

Onions have ruled steady throughout the week. The demand is as heretofore reported.

Under freer receipts tomatoes weakened off, notwithstanding canners took quite freely of the more choice.

In other vegetables the market has shown few changes. Cucumbers, eggplants, etc., fluctuate according to the supply and the demand.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

On the way..... 297,690 313,749

In port, disengaged..... 77,153 56,167

In port, engaged..... 24,897 61,151

Totals..... 399,740 431,067

The above gives a carrying capacity as follows: 1887, 640,736 short tons; 1886, 676,014 short tons; showing a decrease compared with last year of 35,278 tons.

Wool is slow—no desirable grades to be had. Fine and medium fine wools would sell well.

Beans are firm for the more choice, which are in light stock, but poor grades are slow and easier.

In poultry there is nothing new to report, values continuing steady.

San Francisco, August 17, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

WEDNESDAY, Aug. 17, 1887.

A GOOD STOVE.—Having recently purchased an improved Glenwood range of Anderson & Tallon, Nos. 12 and 14 Market St., S. F., we delight in saying that it works to such a charm in our household that we are glad to mention this fact for the benefit of readers who may wish to make sure of getting a No. 1 article in purchasing a cookstove. It seems to be simple and very effective in operation.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours. T indicates trace of rainfall.

Complimentary Samples.
Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

SOUTHERN COAL-FIELDS.—Good bituminous coal has been discovered in Tin Mine canyon, four miles from South Riverside. It is almost pure carbon, burns freely and leaves a clean ash. At a depth of ten feet the vein is three feet thick. In Santiago canyon, eight miles from Santa Ana, a vein nearly a mile in length and fully three feet in depth throughout is reported as cropping out.

THE California Kennel Club has been considering a proposition to hold an exhibition of dogs at Los Angeles, at the time of the October fair. It is reported that several parties have decided to make entries—embracing English and Irish setters, pointers, water spaniels and terriers—provided competent managers and judges be secured.

MAPLE SYRUP is the feature which Smith's Cash Store announces for this week. The prices quoted are exceedingly low, as are the prices usually at this establishment. Their country business has grown to enormous proportions since the people have learned the advantage of trading in the metropolis.

Important to Tree Planters.
One hundred and twenty-five thousand Fruit Trees for sale at a bargain, consisting of Apple, Pear, Peach, Apricot, soft and hard-shell Walnuts; also 2000 Fan-Leaf Palms. Sales will be made in lots, or the Nursery and stock will be sold on the most liberal terms as to price and payments, or will be exchanged for real estate. Inquire of J. M. Hixson, Real Estate Agent, 75 N. Spring street, Los Angeles, or address the proprietor, Milton Thomas, P. O. Box 304, Los Angeles, Cal.

Don't Fail to Write.
Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

ZIMMERMAN Fruit Evaporator.

Read Some of the Testimonials.

I have found the Machine (No. 3) very simple, and it does the work to perfection. Parties who have larger Driers of different makes say they cannot turn out superior fruit (apricots and peaches) to mine.
Vacaville, June 12, 1887. I. W. A. GILMORE

I found the Machine (No. 2) good, and can truly subscribe to all the merits claimed for it. I have sent apples to Santa Rosa and they sold as first-class.
Laguna, July 15, 1887. W. H. J. AITKEN.

Evaporator came safe to hand (No. 3). Have tried apricots with good success.
Stockton Nursery, July 15, 1887. E. C. CLEWES.

Before writing I wanted to test the Drier also on peaches, apples and pears. Am now doing so with the very best results. Upon the whole, I am greatly pleased with the Drier. (Rev. Dr.) W. ALEXANDER.
Batavia, July 29, 1887.

I am doing fine work with the Drier (No. 3). I bought it in company with Mr. A. J. Lay, and he, after trying it, takes it all. You can refer to me and I will try to sell more.
Glenwood, August 5, 1887. C. C. MARTIN.

I have been using a Zimmerman (No. 3) Evaporator on my apricots this season, and cheerfully attest the fact that its performance is fully up to its promise. Its simplicity is such that, although novices, we have succeeded in turning out admirable work, and its economy and facility are quite remarkable.
August 5, 1887. (Of Kittle & Co., S. F.) JAS. PALACHE.

ORANGE, LEMON & LIME TREES FOR THE SEASON OF 1888.

Having the exclusive Agency of the Pacific Coast for the extensive Nurseries of A. Wimberly and A. J. Beach & Son, of Palatka, Florida, we are prepared to furnish Orange, Lemon and Lime Trees of all the leading varieties (budded on seedling stocks) in any quantity desired, from one tree to ten thousand.

AT PRICES THAT ALL CAN AFFORD TO PLANT.

These Trees are all first-class, 3 feet and upward in height and three-fourths of an inch and over in diameter at base of bud.

It will be necessary to give your order early to secure prompt delivery. Special prices given for carload lots. Write for prices or any information desired. Address

C. W. REED & CO.,
SACRAMENTO, CAL.

ORANGE TREES! ORANGE TREES!

Also LEMON and LIME, in large or small lots, both wholesale and retail, CHEAPER THAN EVER BEFORE OFFERED IN THIS MARKET, of the best known varieties.

Our Washington Navel was budded to order, with buds from original trees at Riverside. All other varieties selected by personal inspection; possess the highest excellence and great bearing qualities. They are all budded on the famous sour stock, which is hardier, more vigorous, longer lived and superior in every respect to the sweet stock.

We are prepared to take contracts to plant groves of these trees, and guarantee them to grow. We can also furnish Seedlings in any desired quantity, either Sweet or Sour, AT VERY LOW RATES.

Place your orders soon, to secure choice trees at the lowest rates. Send for descriptive circular and price list. Address

W. R. STRONG & CO., Sacramento, Cal.

TO OWNERS
—OF—
POULTRY, CATTLE,
Horses, Dogs, Etc.:

Keep your Animals Free
from Vermin and in a
Healthy Condition

BY USING
**Ongert's
INSECTICIDE POWDER**

—AND—
Ongert's Microbicide,

Which cures Chicken Diphtheritis, Roup, Mange of Animals, etc. It also heals all Scalds and Burns and other Sores and Wounds. It heals Stings of Mosquitoes, Bees, Wasps, Spiders, etc.

Recommended by the Agricultural Department of the University of California, and by other prominent parties. Send your address for circulars.

FOR SALE BY THE TRADE GENERALLY.

And by **ONGERTH GRAFTING COMPOUND CO.,**

ROOM 20, SAFE DEPOSIT BUILDING, SAN FRANCISCO, CAL.

TO FARMERS:
Keep your Trees in a
Healthy Condition

BY USING
**ONGERTH'S LIQUID
TREE PROTECTOR**

—AND—
**Ongert's
GRAFTING COMPOUND.**

One thorough application is sufficient for years.

This Liquid kills all insect and fungoid parasites. It does not injure the tree, but gives it new life and strength. The Grafting Compound protects wounds and other injuries of trees from the influence of the atmosphere, as it is a perfect substitute for the bark.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE! NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. Koenig—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

Dr. J. Koenig, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully, E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1/2 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

MERY'S IMPROVED PIONEER

BARLEY CRUSHER

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT.

VALUABLE IMPROVEMENTS HAVE BEEN
ADDED THIS YEAR.

This Mill has been in use on this Coast for 6 years,
TAKEN THE PREMIUM AT THE STATE FAIR

Four years in succession, and has met with general favor,
there now being

Over 200 of them in use in California, Nevada & Oregon
It is the most economical and durable Feed Mill in use. I am sole manu-
facturer of the Corrugated Roller Mill. The Mills are all ready to mount
on wagons.

GRAINLAND,
BUTTE CO., CAL., June 9, 1887.
Mr. M. L. Mery—DEAR SIR: We have used one No. 2
Roller Barley Crusher now for eight years and have used
it steady during that time; have crushed 45 tons a day,
and the crusher is as good to-day as when it came out of
your shop. I am satisfied that it is the best mill made.
You may reconstruct this testimonial to the best advan-
tage for you and sign our names, for you cannot overrate
the merits of your mill.
F. E. REAM,
JOHN P. SUTTON.

DURHAM, May 21, 1887.
Mr. M. L. Mery—DEAR SIR: In reply to yours of the
19th, would say that I crushed from two to two and a
half tons per hour, but could crush three and a half tons
per hour if my elevators were large enough to carry the
barley from the machine. The No. 1 machine I used at
Gridley was run on a sack a minute, but if we got be-
hind we could run through five tons an hour, and do
good work. The machine I use here is a No. 2.
Yours,
WM. M. TAYLOR.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

M. L. MERY,

HOP PRESSES.

Send to us for circular, cuts, and prices of new hand-
power Hop Press possessing the following advantages:

1. Perfect facilities for putting on the cloth, as the
bale, after being pressed, is fully exposed at the sides
and ends.
2. A good depth of box for a hand press (7 feet).
3. A perfectly tight and solid box with no slots or
sliding pieces at the ends.
4. A press that presses downward so that bales come
out at the bottom.
5. Powerful progressive leverage and the entire
absence of cast iron racks (which are always liable to
break and fall to give the required power at the pinch).
6. A balanced follower that goes up without assist-
ance.
7. A press which lets the follower swing entirely out
of the way when up so as to allow of easy feeding, and
which has no overhead beams in the way.
8. Perfect facilities for feeding, the top of the press
being even with the floor, so that the hops can be pushed
or slid into it.

ALMOND HULLERS FOR SALE

A. O. RIX, Irvington, Alameda Co., Cal.

FARMERS, ATTENTION! HAVANA PRESS DRILL.

THE ONLY DRILL MADE THAT WILL NOT CRACK THE GRAIN.

BEST DRILL IN THE MARKET!

POINTS OF SUPERIORITY.

1. It deposits the grain more evenly in the soil and as deep as required.
2. It secures a more thorough and even covering for the grain. The runners can be pressed in the ground the proper depth by the operator. The grain is carried to the bottom of the opening made by the runners. A wheel follows each runner of this drill and PRESSES the soil on the grain, PLANTING IT.
3. It presses or rolls the ground over the seed, where the ground ought to be rolled, leaving the space between the rows unrolled, as a protection to the growing crop.
4. All good seed planted grows. The soil is pressed on all the grain alike, moisture arises and germination ensues.
5. It takes less seed per acre. More of it grows. The stand is therefore more uniform.
6. It leaves a deeper and better defined trench or furrow over the seed. The plant is thus protected from winds, holds snow longer, stands more severe cold, and will winter better.
7. It is more easily operated, only requiring one hand and team. Is not obstructed by trash or subject to many delays and vexations attending the use of fluke drills in trashy ground.

Opens the ground for the reception of the seed with a runner, and covers it with a wheel, PLANTING IT. Does better work and takes less seed per acre than any other kind of drill. Can be worked in trashy and on ground where other kinds will not. Has the best adjustable force-feed in the market—a feed especially adapted to drilling.

Oats and Barley,
Wheat and Rye,
Flax and Millet.

WORKS TO PERFECTION!

Light Draft! Good Time! Best Work! No Clogging
or Choking Up! Ride or Drive!

LIST PRICE.

8 Runner 8 Inch.....	\$110 00
14 Runner 7 Inch.....	165 00
16 Runner 7½ Inch.....	200 00

8. It can be worked on trashy or rough ground where no fluke drill will work. The shape of the runners has been made a special study, and they will cut through or pass quickly over all trash or obstruction.
9. IT IS THE BEST, THEREFORE THE CHEAPEST. More than enough is saved in seeding 100 acres of wheat to reduce the price below that of other drills; besides, there is an annual yield in favor of its use of from two to eight bushels per acre.

TESTIMONIAL.

WALNUT GROVE, CAL., July 13, 1887.

MESSEURS. TRUMAN, ISHAM & HOOKER, San Francisco, Cal.—GENTLEMEN: I borrowed a Havana Press Drill from Mr. Jordan and drilled in 200 acres last April and May, after all other parties were through sowing, and my neighbors said it was too late. I had a better crop of barley than those who sowed broadcast in January and February. Had I sown broadcast I would have had no crop, but the Havana Press Drill put the grain down to moisture and I think it is the best way to put in grain.

Pacific Double-Shake Fanning Mill.

- No. 1, Capacity for 18 tons, or 600 bushels for 10 hours, weight, 149 lbs.....\$30 00
 No. 2, Capacity for 25 tons, or 1000 bushels for 10 hours, weight, 165 lbs..... 35 00
 No. 3, Capacity for 30 tons, or 1200 bushels for 10 hours, weight, 225 lbs..... 40 00
 No. 1 PACIFIC—This is the farm size, and has sufficient capacity for all ordinary farm work, which it will do in the most thorough manner.
 No. 2 PACIFIC—A small warehouse Mill, furnished with pulley, if desired. Any farmer having large quantities of grain or seed to clean, will find this Mill invaluable.
 No. 3 PACIFIC—A large and substantial warehouse Mill, having great capacity and doing excellent work. Width of sieve, 33½ inches.
 We have sold this Mill extensively, and it is universally acknowledged that it has no equal.
 A comparison of the "Pacific" with any other style will convince any one that it is stronger, better finished and more durable than any other mill.

It has no cross-sections nailed to the sides, but all (including the head or drum) fit into grooves, and the Mill is held firmly together by rods, which prevent it from getting "out of snare," as will happen sooner or later to all of the old styles. By taking out these rods, the Mill can be easily taken apart and put into compact form for shipping, as shown in Fig. 2, thus making a great saving in cost of freight. We are fully prepared to demonstrate that it is

The Best Working Mill Now In Use.

It is properly proportioned, being shorter and lower, in proportion to width, than any other Mill, which, in connection with the adjustment of the Wind-Board, brings the wind directly upon the under side of the sieves, and separates nearly all substances from the wheat before reaching the screen. It has two spouts, either of which can be used separately or in connection with the other, so that the grain can be perfectly graded, if desired. It is the only Mill to which is attached

Clarke's Patent Double-Shake,

The best contrivance ever used for cleaning Flaxseed, Timothy and other light seeds. It has a variety of shakes in addition to the "Double-Shake," and can be changed instantly from one motion to another, adapting it to grain in any condition, from the driest to the dampest.

DIRECTIONS FOR USING THE PACIFIC DOUBLE-SHAKE MILL.

- TO SEPARATE OATS FROM WHEAT.—Use upper and lower spout with screen in lower groove, screen grader in grooves leading into upper spout, and drop lower end of Handle as low as possible. Use light shake, turn moderately and steadily, and feed as fast as possible without running over any wheat. To take the wheat out at the head of the Mill, take out screen grader and upper spout, and use screen in second groove from bottom.
 TO TAKE COCKLE OUT OF WHEAT.—After taking out the oats, if there are any, take out the upper spout and screen grader; leave the wheat screen in lower groove, and use cockle screen in next groove above, with chess-board in the upper groove. Feed slowly and turn rapidly. If the grain is damp, use heavy shake; if dry, use light shake.
 TO SEPARATE CHAFF FROM WHEAT.—Take out all the sieves and upper spout, put chess-board in the upper groove, screen in lower groove; put rod in heavy shake and turn rapidly.
 TO CLEAN OATS.—Take out upper spout and screen grader; put oat sieve in upper groove, with screen in lower groove; use the heaviest shake and turn fast.
 TO CLEAN BARLEY.—Same directions as for cleaning oats, except to put barley sieve in next groove below the oat sieve.
 TO CHAFF FLAX, TIMOTHY OR CLOVER.—Put oat sieve in upper groove, screen in next groove below, chess-board in place of screen grader, timothy sieve in lower groove. Use the heavy shake.
 TO CLEAN FLAXSEED.—Use flax screen in upper groove, chess-board in next groove below, 14x14. Sieve in groove leading into upper spout. Timothy sieve in lower groove. Use double shake. Keep double shake irons well oiled.
 TO CLEAN TIMOTHY.—Use screen in upper groove, timothy sieve in next groove below chess-board in groove leading into upper spout. Use double shake.
 TO CLEAN CLOVER SEED.—Use 14x14 sieve in place of timothy sieve; other directions same as for cleaning timothy.

PACIFIC RURAL PRESS

TWENTY-PAGE EDITION.

Vol. XXXIV.—No. 9.]

SAN FRANCISCO, SATURDAY, AUGUST 27, 1887.

\$3 a Year, in Advance
SINGLE COPIES, 10 Cts.

A Famous Holstein-Friesian.

We give on this page a portrait of Lena Wit Menlo, winner of the prize for dairy cows at the Santa Clara Valley Fair in San Jose last week. This cow has had a most excellent career as a prize-winner, making her mark first in her native land, for she won the first prize at the North Holland Cattle Show at Alkmaar, Holland, in 1885, giving at that show 22 quarts

of the cow shown in the engraving. Before that, however, the cow will be shown at the Golden Gate Fair in S. F., September 5th, and after that at the State Fair. These exhibitions and the early announcement of the sale will give all full opportunity to examine the animals.

AD ASTRA.—Alvan Clark of Cambridge, Mass., who died the 19th instant at the

Is Sweet Clover Dangerous?

Melilot or "wild alfalfa" (*Medicago lupulina*) has been recommended in some of the papers as likely to prove a valuable forage plant; but it may be well to use it with some caution. Mr. E. Kelsey informs us that while driving from Merced awhile since, he put up at a place where his horses were fed on hay made from this plant, and the next day they became

all the temperate regions of the earth, it was early introduced to the Pacific Coast along with alfilerilla, mustard, sheep burs and many other plants. Being an annual and readily detected by its fragrance alone, it may easily be eradicated if it should be found injurious. We would like to learn what experiences any of our readers have had with it.

THE HOTEL IN THE YOSEMITE.—At a meeting

IMPORTED HOLSTEIN-FRIESIAN COW, LENA WIT MENLO, OWNED BY F. H. BURKE OF MENLO PARK, SAN MATEO COUNTY.

of milk at a milking. After this victory she was brought to the United States and was shown at several fairs, where she won the first award. Her milk record has gone on improving, for at Cincinnati, Ohio, she scored 78 pounds, and in California last February, as stated in the RURAL at the time, she gave 89 pounds (or about 10½ gallons) of milk in one day from dry feed alone.

Lena Wit Menlo is owned by F. H. Burke of Menlo Park, San Mateo county. Because of the sale of his land to Senator Stanford, Mr. Burke proposes to sell his Holsteins at public auction in Sacramento on September 21st, during the State Fair. This sale will include all his bulls and young stock, among which is a yearling heifer and a bull calf, both offspring

age of 83 years, was eminent among scientific men the world over as the maker of the most accurate and powerful telescopic lenses ever constructed. A portrait-painter in early life, he afterward became interested in astronomy and began the manufacture of telescopes. In this pursuit he developed such marvelous talents, and attained an excellence so extraordinary, that middle-age found him, with his two sons, devoted to the making of object-glasses. The finest instruments in European and American observatories owe their perfection to the optical learning and delicate workmanship of this firm, whose masterpiece is the 36 inch objective of the Lick telescope, now safely stored and soon to be placed in position upon Mt. Hamilton.

so stiff and averse to travel that he was compelled to lead them slowly homeward. He surmises that the trouble was due to poisonous properties in the "wild alfalfa" hay.

The plant affects low or moist and shady places by roadsides or in fence corners, rarely forming a large part of the crop in meadows and fields. Single plants in solitary situations will remain prostrate and spreading, but, associated with others, they become erect, often attaining two or three feet in height. Melilot closely resembles alfalfa, but its minute pea-like flowers are yellow, followed by small single-seeded pods in a long, slender spike, while the whole plant is delightfully and abundantly fragrant, giving origin to its common name—Melilot, meaning sweet lotus or pea. Found in

of the Yosemite Valley Commission, held in this city August 19th, bids for the lease of the Stoneman House were opened. The successful bidder was J. J. Cook, an experienced hotel manager, who offered \$1200 per year for a term of 10 years, and \$350 per year for the orchard, grazing, gardening and other privileges. The Commissioners are to receive the building from contractors, formally, about the 1st of October, and Mr. Cook expects to have it ready for the reception of guests the coming spring.

PROF. SPENCER F. BAIRD died at Woodhall, Mass., Aug. 18th. He was eminent as a writer on natural history, as an officer of the Smithsonian Institute and as U. S. Fish Commissioner.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

More About Puget Sound.

EDITORS PRESS:—I wrote you some time ago, setting forth how this region "struck a Californian" on first view. I have now been here nearly a year, and some additions may not be amiss.

The winter was characterized chiefly by softly rainy weather. It held up a day or two—it appeared to be like the little boy's tiresome preacher—it wasn't going to stop; it was only "swelling up again." There was little frost or freezing except at the specially "cold snaps." We had two instead of the customary one—a short one of about a week in December and a long one of near a month in February. On these occasions the wind piped cold and strong, with snow from over the snow-covered mountains at the northeast, and it froze, and froze! It would appear that it freezes at no other time. I tell them that on such occasions the tail end of a Dakota blizzard gets switched over this way.

From common report there was, in this winter, more of rainy weather and less of sunshine than usual, and the "cold snap" was excessive, in there being two instead of the customary one in January of some two weeks' duration. Added to this was the delay in the opening of spring. The farm work commonly begins with March; this year it was delayed six weeks.

We have very little rain this summer. They say there are commonly slight rains or showers about once a week. This summer they appear about a month apart. The weather is not warm enough for good growth in corn, tomatoes, etc., but potatoes and common vegetables flourish well. Grass under fair conditions makes strong growth. The excessive rain and cold last winter appear to affect the hay crop this year. Small bushes spring up freely and will fill all lands not well cropped yearly.

Fruits.

The wild fruits I have observed are the serviceberry, which resembles the Eastern "shadberry," but is not so fine; the salmonberry of fair quality; the black raspberry, not equal to the red; the dewberry, a low running blackberry; the strawberry and gooseberry, of inferior growth; a blueberry (they call it huckleberry) of inferior quality; and the thimbleberry, of no account at all.

In the gardens the tame red raspberry, strawberry, gooseberry, currant, blackberry, are fine, perhaps out rivaling those of any other country in growth and productiveness. The berry buds and blooms upon single strawberry plants are counted by the hundreds.

Apples grow finely. They have a kind of borer here that attacks the branches, and results are seen in dark patches of dead bark. It is cool for peaches, though some are raised. Cherries are not reliable for bearing. I think the same in a degree true of plums. The growth of wood is excessive. The present summer is, I judge, cooler than usual. The sun's rays are cut off a good deal by smoke, haze, or clouds.

The heavy dews are helpful to vegetable growth but deteriorate the quality of the hay. Judged by the appearance of stock last winter, to which farmers "fed plenty of hay," this feed here is not so nourishing as in drier and more dewless sections.

The mosquito pest is a severe one. The waters in the lowlands must cause them to multiply freely and "the plague is upon man and beast." The light winds, characteristic of this climate, avail little in blowing them away. Some sections suffer more than others and my hap appears to be to light upon one in which the insect abounds. The only relief I can see is in cutting away the excessive growth of grass, brush, and tree, and perhaps dropping a little kerosene into their breeding places. Before coming here I read many articles upon the country, but every writer failed to "punctuate" his production, as the full truth demanded, with mosquitoes.

The Land and the People.

My opinions respecting the high order of people settled here, the fertility of the soil, its rare adaptation to the growth of vegetables, small fruits, apples, grass, its prospective eminence as a stock country of small farmers, the healthiness of the climate, the immense amount of work required to fit lands for the plow, are only confirmed by a continued residence.

People are crowding in steadily. Old settlers are realizing it is better to part with a portion of their lands in order to better improve and stock what they have left. People are alive to the intellectual, moral and religious as well as material interests of the community. The country centering around Lynden appears to be the more desirable part of the county. There is no boom, but each month, as a rule, sees a new building added to the little cluster that forms our village. A good academical school adds to the attractions of the place. Religious services are held twice on the Sabbath. If a preacher is at hand, he occupies the time; if not, the people have singing and short addresses of their own. Some time in the future I may tell you more of what the people here are trying to do.

S. H.

Lynden, Whatcom Co., W. T.

Las Posas Lands, Ventura County.

EDITORS PRESS:—In the rich fields of the valley of the Las Posas, we find much land devoted to such field crops as beans, barley, corn and wheat, and from the slight experiments thus far made, it would seem that many kinds and varieties of fruit may here be raised to good advantage.

A few miles east of Springville, Messrs. Rice & Bell have a small orchard, and among other things, the Eureka lemon bearing at three years old. They have also the Washington Navel orange of same age in full bearing. Of peaches, two years from nursery, they have the Early Crawford, this year full of fruit, their apricots three years old bearing this, the second year. A Japan persimmon is doing very well. The Lawton blackberry here proves to be an enormous bearer, fruiting this, the second year. A white unnamed raspberry is, thus far, a success. Apples are on trial, set out three years ago, not yet bearing but growing thriftily, the Catawba and other grapes doing remarkably well and in good bearing this year.

Messrs. R. & B. had, this season, 450 acres in barley, the grain being very fine and full. They raise corn of excellent quality. The soil is a heavy loam and quite retentive of moisture.

Higher up the Las Posas, living in a canyon reaching northwardly from the Las Posas ranch into Las Posas mountains, about 12 miles north-east of Springville, we find our friend C. M. Drake, living a hale, hearty life, surrounded by the attractions of his ranch and home in a narrow valley almost envied by mountains, and enjoying the extreme felicities of wedded life.

Mr. D. has 2200 orchard trees two years old last winter from the setting, generally growing thriftily and some in bearing this season. Among those in bearing we notice some of his apples, and of these we will mention the Newtown pippin and Yellow Bellefleur. His nectarines are extraordinarily full, and for them present appearances would indicate a great success at this place. Apricots in good bearing this year and well distributed over the trees. Peaches bearing heavily this season. Prunes growing well but not yet fruiting. Grapes for raisins, one year old last spring, looking very well and from 20 to 30 bunches per vine.

We find growing here tomato plants now over four years old, showing, we may say, complete absence of frost. In 1886 these plants, in the ordinary process of bearing, ripening, etc., had fruit on them every day of the year. The first slope of the foothills west of the road, leading up alongside of orchard, is set to walnuts, and looking as if they would thrive and do well.

Mr. D. has an apiary of 250 colonies of bees. Last year they brought him, on the average, \$5 per colony. This year the bee-keeping, as a business, has been nearly a failure all over this country because of a want of the ordinary bee forage, the honey-yielding flowers being present in abundance, but the melliferous substance usually found in the flowers and necessary for honey-making being notably absent.

Ventura Co.

McD.

Notes From Mesa, Arizona.

EDITORS PRESS:—Having carefully read your valuable paper for over two years and not seeing anything from our rural town, I thought a few lines from here might not be uninteresting to some of your readers.

Our little village is located on the tablelands lying in the eastern part of Salt River valley, some 18 miles east of Phoenix. This thrifty town was founded nine years ago by about 15 hardy pioneers who came from Northern Utah, and after working hard for about ten months succeeded in getting a ditch, that would carry about 300 inches of water, completed for a distance of nine miles, to our present townsite. Since then our numbers have gradually increased, and by degrees we have enlarged our canal until it now carries over 4000 inches of as good water as any person need wish to drink or run upon the soil.

This place, which was then a barren desert, and counted by many of the older settlers irreclaimable, has for over six miles square been turned into fine orchards, beautiful vineyards, smiling fields and comfortable homes. The land yields to the cultivator ample returns for honest toil, and most of those pioneers are able to now sit under their own vine and fig tree and enjoy the fruits of their labors.

The principal crops that are raised here are peaches, grapes and alfalfa, which generally yield immense crops. Peaches and grapes commence bearing the second year from the bud and cutting. The fig thrives exceedingly well in this place, frequently bearing three good crops a year. Apples, pears, prunes and other varieties of fruit are cultivated to some extent, but not with as good results as the above.

The live-stock interest is also receiving its share of attention. We have several as fine horses here as any man need wish to look at. They are Norman-Percheron and other noted draft stock and Hambletonian and other roadsters; also of horned stock we have the Short-horn, Holstein and Jersey. We hope in the near future to have a class of stock that will equal, if not excel, any of our sister towns in the valley for draft, driving, beef or dairying.

SUBSCRIBER.

Mesa, Maricopa Co., Arizona.

FLORICULTURE.

Facts About Flowers.

(Written for the RURAL PRESS by FRANCES M. PAYSON.)

To Preserve Cut Flowers.

These may be kept fresh for a considerable time by keeping them moist, not the stems only, but the whole bouquet. In dry weather a nice way to do this, if one is the happy owner of a bell glass, is to set the vase containing the flowers in a flat dish of water and turn the bell glass over them. The evaporation of the water in the glass keeps them continually moist. Another and very simple method of prolonging the life of a bouquet where flowers are scarce is to sprinkle it lightly with water and put the stems into a vase of soap suds. Each morning take it out of the suds and lay it sideways in fresh water, sprinkling the top slightly, then replace in the suds and it will be as bright and fresh as ever. The suds should be changed every three or four days.

Another very good method is to put into the water in which they stand a little of the solution of carbonate of ammonia and a few drops of phosphate of soda. This has a wonderful effect in brightening their color and strengthening them. By cutting off a half-inch of the stem with a sharp knife every other day, they will keep fresh as long as their natural life would last if on the bush.

There is a method in use in Germany for the preservation of rosebuds which might be used very conveniently at times when lovely buds are wanted to bloom on just the right occasion. This consists in first covering the end of the freshly-cut stem with wax and then placing each one separately in a closed paper cap or cone, not allowing the petals to touch the paper. The cone is then coated with glue to exclude all air, dust and moisture, and when dry it is stood on its stem in a cool, dark place. When wanted for use the bud is removed from its cover, the waxed end of the stem cut, and the stem placed in fresh water, when the bud unfolds in a few hours.

To Restore Faded Flowers.

Although dead flowers are dead, still there are many (the stronger and thicker petaled kinds) which, if only badly faded, may be more or less restored by immersing their stems half-way in very hot water and allowing them to remain in it till it cools or they are freshened. The soaked portion of the stem should then be cut off and the flowers put into fresh water. All flowers cannot be restored in this way, but many kinds admit of it.

To Preserve Ferns Fresh.

Ferns, which usually wilt so quickly, may be kept fresh and green for several days if immersed each night in water and allowed to lie in it. I have seen the delicate wild maiden-hair, the most difficult of all kinds to keep fresh, by being treated in this way, worn every night for a week in a young lady's hair.

A Curious Experiment.

If one wishes to try a little surprise for one's friends or play an April-fool's joke, take a bottle of any color of aniline ink (though the red looks prettiest) and insert in it the stem of some white flower which is never seen blooming in that particular color. By watching, at the end of 10 minutes or so you will see the vivid color gradually creeping up all the little veins till they are in brilliant contrast to the rest of the flower. The longer it remains in the ink the deeper the color will grow. When the tint suits you, you should cut the end of the stem and insert in fresh water to freshen it.

Although I have frequently "fooled" others in this way, I was once caught myself, by seeing such an exquisite rose worn by a gentleman, that, being a great rose-lover, I overcame my bashfulness and begged to know the name. It was of a most exquisite salmon tint—a yellow Marechal Niel colored with red aniline!

A friend of mine was once offered \$50 by a florist for the original plant from which a pale-pink pansy (the color so long sought in pansies) had been taken.

Flowers in Paraffine.

Fresh-cut flowers free from moisture, of the kinds which have the most substance, make pretty specimens if dipped in melted paraffine and quickly withdrawn. The paraffine should only be hot enough to maintain its fluidity, and the flowers should be dipped one at a time, holding them by the stem and moving them about to get rid of air bubbles and allow the liquid to touch every part.

A New Way to Mail Flowers.

It is sometimes desirable to send cut flowers by mail for some distance, either to a sick friend or (as Californians love to do) to the East, that those who love them may get a glimpse of our lovely flowers.

I have had flowers sent, a few at a time very nicely, clear to Illinois, in hot summer weather, by taking large potatoes, cutting them in half and hollowing them out till they were merely shells a half-inch thick or so. Take what flowers you wish to send (not the most delicate and perishable), freshen them in water and inclose in the two halves of the potato, firmly tying and wrapping it.

I have seen whole bouquets sent in this way, as a potato weighs little, and a half-dozen cost but little to mail. The wise way to treat the

flowers sent in this way is to immerse them entirely in water or use the bell-glass method of preserving, as they will, although perfectly fresh on arrival, wilt rapidly in the hot, dry air.

Mailing a Bouquet.

Bouquets may be mailed for a short distance by dampening them all over first and then inserting in a box (either of strong pasteboard or thin wood), stems upward, the stems being inserted in a false top which fits tightly into the box and has a hole to admit the stems. Above this false top the stems may be secured either by wire or string, so that the bouquet remains immovable, and the cover then fastened on. In this way, for a short distance, a bunch of cut flowers may be sent quite safely.

Mailing Cuttings and Plants.

Most cuttings will admit of being cut several days before using, and may therefore be mailed some distance with impunity. Rose cuttings will, if soaked thoroughly before using, and clipped freshly at the ends, bear a week of waiting before they are planted. Geraniums are all the better for a few days' drying out and may be mailed, if trimmed back closely first, without any previous soaking in water. As a usual thing, however, cuttings, after being closely trimmed, should be soaked for an hour or two and then securely wrapped in cloth and paper. No further precaution is necessary, except a thorough soaking in fresh water at the end of their journey before planting. To mail plants safely a long distance requires a wooden box, not pasteboard (a cigar-box does very well for a few), and packing tightly, so that the plants may not shake around or their roots be disturbed. Where the weight is not too great, wrap the roots in a tight, wet ball of earth and tie securely in a cloth. I have sent a small package of plants very securely, blossoms and all, for a journey of a day or so, merely tying the roots tightly in this manner, wrapping thickly in newspaper half-way to the tops of the plants, and then covering the whole with a last of tough, thick brown paper, such as is used in making paper boxes for holding papers in offices. This I rolled around them tightly, folding neatly at the bottom, and bringing it up over the top, an inch or so higher than the plants, pinning on the other side and cutting on each side a narrow slit to admit air. Having been thoroughly tied, marked "plants" and sent in the mail, the package arrived in perfect condition, every leaf fresh and not a blossom withered.

Home-Made Waxed Paper.

If you find it necessary to use (as many think it indispensable) waxed paper and have none at hand, you may make it with little difficulty by taking a stove griddle just warm enough to melt beeswax, laying over it a thin paper (tissue is best) and rubbing it with a piece of beeswax until every part has a thin film upon it. For packing moss, the thin moss which grows on stones does very well if wetted and squeezed dry. As a last resort, cotton treated like the moss will do reasonably well. If you have fears of your twine breaking, wax it. Never allow your box to go half full. This is a necessary precaution, and when neglected is often the cause of failure in their safe transportation.

Lengthening Hyacinth Stems.

Any one who has grown hyacinths in the house knows how often they will put out flower buds when the stem is but an inch or so long. A good way to force a longer growth of stem is to cover the plant with a paper cone, thick enough and so secured at the bottom as to exclude all light below, but with the top of the cone cut away enough to admit a little light at the top. The nature of plants being to grow toward the light, the hyacinth will strive upward with the desired result.

Paper Pots.

Good pots for small house plants may be made in an emergency of the stiff paper referred to above. Take a strip ten inches long by four wide and lap over and pin the ends. Double flat and crease, and then fold again just between these first creases and crease again to form the four corners. Take the scissors and slash up the bottom of each crease for an inch, turning up the four cut pieces and pinning over to form a bottom. These pots are always to be had for the making, and last quite a little while, and may be then thrown away without a feeling of wastefulness.

Grafting Dahlias.

Dahlias may be quite readily grafted by the following simple process. For this purpose the worthless tubers which are nearly always found hanging loosely from the stem are as good as any. These never sprout and are otherwise good for nothing. Make a cutting from a growing plant which includes two buds, one close to the bottom and one near the top, the leaf-stalk being taken off close to the bottom bud, and the cutting shaved away slightly on the sides close to it. Have the cutting shaved square at the bottom. Take a tuber or cut off one pointed end. On one side cut an indentation just the size to admit the end of the cutting for a quarter of its length. Insert the cutting bud outward and plant. If properly done, the result will be a healthy, vigorous plant.

Good Labels for Plants.

A label which will resist the weather is easily made by merely taking thin slips of wood, writing the name in ordinary ink upon it, and immersing in linseed-oil varnish until they are thoroughly permeated by it. Once being dried

perfectly in the open air, they become as hard as metal, resist water for a long time and are better than any metal strips.

A Novel Hanging Basket.

A pretty and entirely inexpensive hanging basket may be made by taking a large-sized carrot, cutting it off at the point to two-thirds its original length, scraping out the inside until it is merely a shell of one-half an inch in thickness, and filling it with water. When suspended by cords inserted and hung in the sun, it soon begins to shoot out at the butt, and sends its feathery green foliage curling up around it, for nothing, of course, will grow downward. The contrast of orange and green is very pretty, and the foliage itself is most beautiful.

Growing Peas in Water.

Another pretty and inexpensive way of having greenery in one's room is the old way of growing peas in water. Take a tumbler, tie a bit of netting over the top, and lay on it some peas (or beans of the running sorts), allowing them rarely to touch the water. In a few days they will have swelled and sent out their first tiny leaf and rootlet, and soon the entire tumbler will be filled with roots and the green vine filled with blossoms will wind its spiral way up the nearest support. This is a great delight to children, seeing the roots actually grow before them, and to an invalid it is almost as much pleasure.

Taking Impressions of Leaves.

By following these directions an impression of the most delicate leaves may be made, with their most minute veins and hair.

Take a sheet of closely woven paper and oil it well with sweet oil. After it has stood for a minute or so and soaked through, rub off the superfluous oil with a piece of paper, and let it hang in the air to dry. When the oil is pretty well in, take a lighted candle and move the paper over it, touching the flame till it is smoked perfectly black. Lay your plant accurately on the smoked paper, put a clean paper over and rub it carefully in every part. Then take your leaf up gently, being particular to keep it just in its order, and lay it on the paper which is to receive the impression. Put a piece of blotting paper over it, and rub it thoroughly. You will have a perfect likeness of your leaf like the finest engraving. You may use your oiled paper a number of times.

THE STOCK YARD.

Hints on Importing Live-Stock.

EDITORS PRESS:—Although there are a large number of importers of cattle who well understand the subject, there are others who do not import animals on a large scale, lose them by a want of knowledge of simple matters relating to the treatment of them on shipboard and subsequently. Purchasers of Clydesdale and other tallions are too anxious to get those that are fat and sleek—out of hard condition—forgetting or perhaps not aware of the fact that these horses, in that particular state, are very unfit to undergo the trials of a sea voyage, the result being that a very large percentage lie ere they have been on the ocean three or four days. It must be evident to any one that these plethoric animals are very liable to an attack of inflammation, and as a matter of fact a large number of stallions succumb to pneumonia generally about midway in the Atlantic, but of course that greatly depends upon circumstances, rough weather, general treatment, etc.

American buyers—I refer to those who go personally to buy a single animal—generally proceed to some well-known dealer who has a number of stallions. If this salesman has a good reputation as being more honest than most horse-dealers, perhaps he does well to go to such a man, especially if he—the buyer—is not a “horseman;” but, on the other hand, should be a man well versed in horse matters, then he might with advantage proceed to a good farmer, from whom he would be likely to procure a stallion at much less price than from the horse-dealer. And this is a practical point upon which I would wish to lay much stress, viz., that dealers generally do their utmost to attend animals for sale, and farmers frequently sell their stallions right off the plow. It needs little reasoning to show which horses are in the most natural condition and best fit to “rough” upon the ocean. It is a well-known fact to practical men that herein lies the reason that so many valuable equine lives are lost and committed to the waves.

In my own experience I can point to a great number of cases proving this common-sense argument. If a horse is suffering from a simple cold or ordinary attack of distemper prior to shipment, he should remain on shore until recovery. It is a good practice to provide oneself with an ordinary hypodermic veterinary syringe, so that, should there be any symptoms of excitement or tendency to fever during the voyage, the owner may administer a dose of morphia under the skin. This is quite a simple operation, and any veterinarian or druggist would prepare the liquid and direct as to its use. I am acquainted with a man who has adopted this device during a fit of nervousness in his stallion, and he attributes—I think rightly—to this treatment the safe passage of his horse. The idea of stopping up all the

crevices through which air may come as soon as the animal begins to “blow” is a great mistake. He should be allowed all the pure air he can get.

There are some people, even on board ship, when a valuable horse is sick, who are extremely anxious to offer advice upon the subject, about which they know little. It will be found that their remedies and suggestions vary greatly; some may even recommend charms. But there is little doubt that it is best for the perplexed owner to visit the ship's surgeon, if there is one, and he will probably be willing to become, for the time, a veterinarian.

When horses are landed on this continent they are often shut up and fed with too much grain. It should be remembered that stallions in Europe and well-conducted stables in this country are generally exercised, and often, as I have said, put to ordinary work with the other farm horses. There can be no greater folly than to pamper them. Plenty of exercise, good food and general natural conditions will make strong and hardy horses.

ROBERT J. DAWSON,
225 Geary St., S. F. Veterinary Surgeon.

POULTRY YARD.

Los Angeles Poultry Notes.

A writer for the Los Angeles Mirror gives the following running notes on poultry topics:

Egg-Eating.

Egg-eating is a vice of not very frequent occurrence among well-kept poultry. Every one knows how greedily egg-shells will be devoured by hens. They are fond of the inner lining and the shell. It is well enough to feed laying hens with the empty shells that come from the kitchen. The lime will furnish material for future shells; but they should always be crushed and mixed with the soft food. If thrown out carelessly the eating of them may be only the first lesson of a vicious course. The shell-eater may quickly become an egg-eater. One vigorous thrust of the beak into a perfect egg in the nest, and the mischief is done. This is nectar. Other fowls approach for a taste; and they will all appreciate the food, cackling in loud tones, calling it a superior tonic, easy to take.

Another accident which causes fowls to get in this bad habit is the dropping of an occasional egg from the roost. It may become broken by the fall, and when daylight comes, the eyes of the fowls are open to the fact that an egg contains sweet meat, and they get a notion into their heads that was never there before. But

The Cause of Egg-Eating

In the nest that operates most frequently is the deposit of thin-shelled eggs. A scant supply of lime and a long period of laying will result in this condition, even when fowls are quite healthy. A neglect to supply lime in the form of bone or seashells is sometimes the primary cause of egg-eating, but there is an occasional instance of thin-shelled eggs that is owing to some disease or deformity in the oviduct, where the shell is formed by secretion. The fowl may be, to all appearances, perfectly healthy, and have a full supply of lime, but one side of each egg she lays will be flattened and the shell on the flat side very thin. Of course, if her eggs are not moved from the nest as soon as laid, there will sooner or later occur breaking, with its sure consequences. If eggs are gathered often, this evil may be avoided, but we have seen a fowl, the layer of such imperfect eggs, turn round immediately after laying and partake of a warm breakfast. The fancier who has a flock of valuable fowls may well keep watch and ascertain for a certainty which fowl lays thin-shelled eggs, and remove her at once, for her usefulness is at an end, so far as egg-production is concerned. She must be short-lived, else unprofitable. There are

Precautions and Preventives

That have been recommended and practiced with success, thus avoiding this vicious habit. The nests should be so made and arranged that the eggs will not be in full light and in plain sight. If the next box is open only on one side, and the entrance is turned away from the light and approached through a partially darkened passageway, the fowls will not enter it ordinarily except when ready to deposit an egg. It is also advisable to keep in each nest a false egg made of plaster, wood or porcelain; also a nest full scattered about the pen on the ground. They will sometimes pick at these, and will shortly ascertain that they do not make any headway with the decoys, and be convinced that eggs do not contain anything that may be appropriated. That makes a good feature in their education, for when they have given up the attempt to break artificial eggs they will not try their beaks on real ones, especially if they are found in a partially darkened and secluded nest.

Many writers recommend a nest so contrived that when an egg is laid it rolls away out of sight. Others advise blowing the meat out of an egg and filling the shell with mustard or cayenne pepper. The former plan will of course work all right, though we know by experience that the latter will not. However, if care is taken to provide plenty of shell material, very little trouble need be apprehended from egg-eating hens.

Germes.

While there has been no limit to the age at which a hen will quit laying, it has been pretty

well established that after three years it is best to sell. Each year it is advisable to breed as many pullets as hens, and keep nothing in your flocks that is unprofitable, and have the stock strong and vigorous.

All fowls kept by a farmer after they are two years old are kept at a loss, so far as money is concerned. When a whole flock is allowed to run without killing off the old ones and replacing them by pullets, disease is sure to attack them. They become liable to roup, swell-head, etc., after they become aged. If an egg has been set on, even for a few hours, the size of the germ is increased, and if left in the nest of a setting hen for 24 hours small blood-vessels may be seen forming a beautiful zone around it. It should not be imagined that the yolk is a mere unorganized liquid. It is composed, like the white, of concentric layers, which may be seen when it is boiled hard, and from the germ a tube runs to a central hollow cavity that is also to be noticed when an egg, boiled hard, is cut across.

As the seasons go by, we find many new hands embarking in the poultry business for pleasure or profit.

Fowls in confinement require a variety of food to prosper. They require a mixture of green food with grain, as much as horses or cattle do. Too much solid food, where there is not proper exercise, tends to fatten. When hens take on fat they usually fall off laying. Yarded fowls do not need the same hearty food as birds at liberty. Light, nutritious and easily digested food is required by fowls in confinement. Never allow them to make whole corn a staple diet.

Fresh Meat

Two or three times a week is necessary for fowls in confinement, and in summer especially, when they are deprived of insect food.

Poultry Experience in San Luis Obispo.

Cassius Martin gives the San Luis Obispo Tribune a sketch of his experience with fowls, as follows:

“Will the chicken business pay in San Luis Obispo county?” is a question frequently asked, and as I have been in that business for 15 years I think I am in position to answer the question. Briefly, then, let me demonstrate my proposition. In the first place, some people claim, especially new-comers, that chickens cannot be raised profitably on this coast. They allege that too many die young to make the industry profitable. Such may be the case, but the fault does not lie with the country by any means, but from the ignorance of the people engaged in the business.

My long experience here has clearly proven that chickens are more easily taken care of and can be more successfully raised than in the Eastern States, and I propose to tell you the reason. We get better prices here. I have sold hundreds of dozens of eggs in the Western States for eight cents per dozen, and have sometimes sold as low as five cents in Kansas and Iowa. But farmers there agree that to sell eggs at the latter price doesn't pay for the wear and tear of the hen. And that is just what we think here when the price gets down to 10 cents. But it is a very rare thing that eggs are ever quoted as low as that. We generally average about 20 cents the year around. Eggs are now selling for 25 cents per dozen, and when it is taken into consideration that this is the month of August, it will give one a fair idea of the profits in the business.

As for chickens, I used to sell them back in “the States” for 10 cents apiece, and the same would bring 25 cents here. And while we are talking about prices, it may be pertinent right here to insert an account kept strictly by myself of all chickens and eggs sold in the year 1886, with the cost of feed, etc., for 90 hens:

Eggs sold (586 dozen).....	\$ 95 15
Chickens sold (94).....	24 75
Total.....	\$119 90
Cost of feed.....	52 45

Net profit.....	\$67 45
Used for family (lowest calculation).....	90 00

The above shows a clear profit of a dollar per hen, and if anything, I have underestimated it. The profits for this year are still more encouraging. For the seven months—January 1st to July 31st—the account stands for about 120 hens:

Chickens sold.....	\$ 21 40
Eggs sold.....	86 85

Total.....	\$108 25
Feed.....	24 55

Net.....	\$83 70
Eggs and chickens for family use.....	16 30

\$100 00

I think that if a hen is properly treated, she will yield \$1 per year in eggs, or chickens here in California, but I do not presume to say that if a man can make \$100 off of 100 hens, it naturally follows that he can make \$1000 with 1000 hens, for I don't think he can. Your place will carry or keep, say from 100 to 300 hens nicely, and if you try to raise more, you overstock, and your profits diminish accordingly.

I will conclude my letter with a short reference to the kind of feed my experience has taught me is the best. Wheat, then, is my first choice, corn next, barley, etc. I also use considerable milk, meat, Chili pepper, cabbage

and other vegetables, and also hay. Some may sneer at the idea of a hen eating hay, but if you don't believe it, just turn 100 hens loose on your stack-yard, and you will find they will make away with more than a horse. They will also eat up all the grass within a radius of 50 yards from the roost.

FORESTRY.

Grazing vs. Fire.

EDITORS PRESS:—I see that the Board of Forestry was in session a short time ago. I think that some of their plans are very good, but some of their ideas are wrong. Some think that the sheep and goats do more harm than the fire to the young growth of timber. I have lived in California nearly 37 years, and have lived here over 29 years; and where it was nearly open land when I came here, the tan-bark oak and young fir timber is so thick you can scarcely get through it right in the sheep range. And then, sheep and goats won't eat redwood.

Here in Ukiah, where the first settlers cut the redwood down 28 or 29 years ago, they have sprouted and are now as high as 75 or 100 feet, and there are quite a number of redwood thickets in the hills west of town. If the fire had been kept out, there would have been a nice grove of timber now, but the fire runs through these mountains every few years and kills all the small timber. If it were not for the fire, the redwood would grow very fast, for when a redwood is cut down, unless it is too old a tree, it will sprout up again and the sprouts grow very fast; but how the fire is to be kept out is one of the things that will be hard to tell.

Thomas Magee of San Francisco proposes the enactment of a law to prevent sheep from running on Government land. Such a law would inflict great hardship on the sheepmen in this county. I think it will result in a great many lawsuits. There are but few sheep ranges in this part of the country from which the sheep do not run on some Government land. The land is not worth entering, for a great portion of the hills in this country are covered with chemical, and it is not worth anything except for goats; they will do well on it, but it pulls out the mohair so that they do not shear much, and there is not much profit in the goat business.

They say Government does not get any taxes for the land. Well, it does for the sheep and goats, and that is better than nothing.

Ukiah, Aug. 8, 1887.

J. F. TODD.

Suggestions as to Fires.

A correspondent of the Chronicle writing from Shasta, where terrible fires have occurred during the present month, gives the following notes as the results of interviews with old residents:

Forest fires in the mountains are becoming every year less frequent but far more destructive. This is owing first, to the law against kindling them; and secondly, to the dense and rapidly accumulating growth of underbrush and forest debris. Early settlers found many of the mountain ridges almost bare of undergrowth or shrubbery and covered with fair-sized trees, valuable for wood and timber and high grass. This, it is claimed, was owing to the efforts of the Indians, who kept the country burned over to enable them to readily find the game upon which they depended. Since settlement by whites, the accessible timber has, to a great extent, been removed about settlements, the grass kept down by stock, and fires prevented, and the hills and ridges have become thickly covered with a worthless undergrowth, in many districts impenetrable to man or beast, which rapidly accumulates, and which is a source of constant danger. Much of this mountain territory cannot be utilized except for a stock range, and will not, for many years at least, be cleared.

The sentiment among old residents and mountaineers is that these districts should be regularly and systematically fired and burned over in the early summer months, when the fire can be easily guided and controlled, and this done often enough to prevent an accumulation of undergrowth sufficient to destroy valuable timber by accidental fires. It is simply impossible to prevent forest fires—it is only a question of time when the accumulation of dead, dry brush and trash will be ignited.

Fire originates in the mountains in a hundred ways—from a match by the roadside, a cigar, a spark from a railroad engine, the carelessness or intentional neglect of Indians, hunters, prospectors or the numberless campers in the mountains during the summer. When started late in the season it is simply uncontrollable and results in a conflagration that sweeps the country, destroys immense tracts of valuable timber and imperils stock, property, lives and even towns. The common, sensible and growing sentiment is that a few harmless bonfires in May and June would prevent destructive and devastating conflagrations in July, August and September.

The law prohibiting forest fires should be amended so as to encourage firing certain tracts at stated times, when no damage would result to timber and when the fire could be controlled and managed about settlements.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Temescal Grange.

At the meeting last Saturday a member mentioned the receipt of a letter from Prof. Hilgard, in which he expressed grave doubts as to whether any experimental farms could be established in California for a year or two to come, for the reason that the Act of Congress promising \$15,000 a year to each State for such a purpose made no provision for funds. The coming session of Congress will be a short one, and the presidential campaign being at hand, it is apprehended that the necessary legislative action is not likely to be had very soon.

It is thought that the Granges and farmers all over the country should take the matter up, and by united effort spur their Congressmen to endeavor to secure complete legislation in this matter. It would seem that such insufficient legislation should be remedied as speedily as possible on the reassembling of Congress. Farmers should be no less active in pressing their rights than any other class. The attention of the State Grange should be called to this subject, and we hope that the Granges throughout the State will discuss the matter, so that representatives may be well prepared to act on the will of their constituents.

Brother Frink suggested that farmers should experiment more, and systematically and carefully report facts at the State Grange for publication with the annual proceedings. He once asked a number of farmers how much wheat they considered best to sow per acre, and the answers received varied from 50 to 100 pounds. He had found that 25 pounds was sufficient. There is hardly any telling as to the difference in returns from sowing a larger or a smaller amount in most cases, without weighing and carefully keeping account of the exact amount sowed and the exact amount harvested on ground of the same kind and tried at the same time. On the Sacramento river in 1864, 25 pounds of alfalfa per acre was usually sowed. He found that, with proper cultivation and careful sowing, one pound was sufficient; it produced the best 10 acres that he had.

Brother Kelsey said much depended on circumstances. Seed placed a little too deep or too shallow would not grow; consequently, it is only a portion of the seed sown that propagates. Perhaps one to three pounds is sufficient in most places. Some sow up to 40 pounds. In answer to Brother Frink, as to how much turnip seed he would sow to an acre, Brother Kelsey replied about four ounces.

Brother Frink declared that every alfalfa plant matured would occupy more than a foot of ground. When more plants are sowed, the stronger root out the weaker ones, until not more than one plant to each foot of ground remains.

Considerable discussion was had over the supply of water for Oakland and other cities in California.

Brother Renwick called attention to the fact that a farmer selling fruit raised on his own place had been warned by a policeman that such action was illegal. This question being considered very important, Bros. Frink, Payne and Kelsey were appointed a committee to investigate the Oakland city license laws and report on the matter at a future meeting.

The next meeting takes place on Saturday evening, September 3d, at which it is hoped there will be a full attendance.

Watsonville Grange Fair.

EDITORS PRESS:—For the last month the meetings of Watsonville Grange have been occupied with discussing the desirability of holding an agricultural fair at this end of Santa Cruz county.

In order to interest all, an open meeting was called. A goodly number of our people attended, and evinced a good deal of enthusiasm. Reports of committees previously appointed being favorable, it was unanimously voted to hold a fair September 15th to 17th, where all may see the largest pumpkins, the tallest wheat, the best apples, the sweetest plums and the biggest potatoes from this, one of the smallest but richest valleys in the State of California.

Contemporaneous with the fair is the establishment of a free reading-room, through the untiring efforts of the worthy ladies of the W. C. T. U.

Thus at last has beautiful Pajaro, the home of the vine, the olive, the apricot and the prune, awakened to the greatness of her possibilities. Watsonville, Aug. 21, 1887. A. P. R.

[We are pleased to see this move on the part of the members and friends of Watsonville Grange, and that so fine an agricultural district as they represent is to have its products displayed and its excellent capacities demonstrated. We are also obliged to the active and enterprising Brother who sends us the above information, and hope he will often favor us in like manner—for the sake of both our readers and his neighbors.—EDS. PRESS.]

Alkali Lands Again.

EDITORS PRESS:—Referring to my "Propositions Concerning Alkali Lands," in the RURAL PRESS of August 6th, I beg a further hearing. I have recently been shown a letter from a farmer in the Kern county artesian belt. The writer says that my communication had been read and commented on at a meeting of his Grange, and that he, with others in that section of the country, intended to try the experiment as I suggested.

Passing over some of his remarks, complimentary and otherwise, the general tenor of his letter impels me to come to the front with a most strenuous protest against experiments being made *partly* after my method, but more or less modified by circumstances or the fancies of the experimenter. I am willing enough to shoulder any failures that may result from my ideas being carried out, but I do not propose that those who, having worked *partially* on my plan, make failures, shall hereafter complain that my ideas are erroneous, as shown by the results of their experiments, and consequently condemn my theory.

The Kern county farmer referred to stated that he had no subsoil plow, but would do the best he could with the tools he had.

I protest loudly! Let him get a subsoil plow. I object to his trying my experiment until he has one. It costs but about \$15.

Then, again, he writes: "As for alfalfa, will put some in as suggested as near as we can with our tools, and if we do have to flood it, it will soon drain off the high places."

Again I loudly protest, both against doing the work as near as he can with the tools he has and against the possible flooding he treats so lightly, after all I have written in the first article on the extreme importance of *not* flooding! He writes that "the article is an able one and voices his sentiments exactly," and then coolly says he will try to come somewhere near carrying them out. This gentleman's name is not divulged to me, so I cannot make him a personal appeal; but as his Grange takes the RURAL, he may possibly read this. So I hereby beg him not to experiment with his alkali land at all, as he evidently has no conception of the importance of the main points of the theory. Having failed, he would assuredly curse the land, the country, the climate—everything but himself. Knowing that the experiment, tried as he would try it, must be a failure, I again beg him not to try it, for my sake, as it would certainly work injustice to me.

I also wish to call his attention to a point which he has evidently overlooked. Neither he nor his neighbors will see the results of their experiments before 1889; as for the successful working out of my theory, the summer-fallow of 1888 on wild soil turned up from a depth of 12 inches and a subsoiling of 12 inches still further down, is a prime necessity. So we do not care for any reports before a year and a half or two years hence. On some soils, if the land were properly plowed and unsoiled by the end of August present, a crop might be a success, if planted the coming winter or spring, but it must be soil of a naturally warm nature and one that has been dropped before, and *not* the land of our Kern county friend—if it be correctly described as being a clayey, putty-like soil—that needs the sun, air, and light on it for an entire summer.

Then I will assure my friend that not only will his land produce (even his greasewood land) but that it will seep for feet instead of inches—which he says is the most it will do now.

Let me repeat it! I do earnestly protest against my theory being tested in other people's ways. Do it *my* way, and prove me a fool if you can, and I will take my punishment like a man. RECLAIMER.

S. F., Aug. 23, 1887.

Resolutions of Respect.

The ensuing report of action taken in view of the death of Sister Ruth Barnes comes to us under the official seal of Santa Rosa Grange:

In Memoriam.

The Committee on Memorial and Resolutions beg leave to submit the following:

WHEREAS, The Great Master of the universe has seen fit to remove from our midst and from our Councils a beloved Sister; and

Whereas, We bow with submission and in meekness to the will of Him who "doeth all things well;" therefore

Resolved, That in the death of Sister Ruth Barnes Santa Rosa Grange has lost a true and faithful member, the Order a consistent Christian, and the community in which she lived a friend to all who tried to do right.

Resolved, That the charter of Santa Rosa Grange be draped in the usual bands of mourning, and that the members wear the badges for the period of 30 days.

Resolved, That these resolutions be spread on the minutes of this Grange and a copy be furnished the local press, the *California Patron* and the *PACIFIC RURAL PRESS* for publication.

MARY E. SAXTON,
MRS. E. A. ROGERS,
JOHN ADAMS,
Committee.

THE WORTHY MASTER AT GRASS VALLEY.—The *Tidings* says that on Saturday night, August 13th, Grass Valley Grange entertained State Master Johnston and lady in a good, old-fashioned manner, that delighted those person-

ages. All formality was dispensed with, cheery, heart-warming hospitality taking the place of cold conventionalisms. At the conclusion of the secret work, on which the State Master lectured, a banquet was served at which Simon-pure spring chickens played a leading role. The occasion was a very happy one.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

Judging from the reports that are coming in from the various signal stations all over the country, the "probabilities" plainly indicate, for the coming months of fall and winter, more activity in the Grange atmosphere than for a long time before. The "cold wave" has passed, the temperature is rising and a warm wave is rolling across the continent, widespread and so penetrating that even the most remote districts must feel its influence.

Offensive and yet defensive, aggressive and yet conservative, the Grange is moving grandly on, winning more and more the respect that age commands, and the success a good cause so well deserves. Let the faint hearts and those of little faith cheer up and take hold again. Let those who have followed after new and strange gods return to the faith of their fathers. Let the lost and stray sheep come once more into the fold. The Grange was *never* so successful as now; figures, words and deeds proclaim it. "Nothing succeeds like success."

If people who are so unfortunate as to live where the Grange is not a success will take the trouble to investigate the matter outside their immediate vicinity, they will soon become convinced that the Grange is not a failure, but one of the grandest successes of the times.—*Rural Vermonter*.

WHAT Patron but feels the enthusiasm of past years returning when he witnesses the uprising of our class in behalf of their calling, home and country? There are few Granges now dormant but are capable of reanimation, and it is merely a question as to time. Shall the few faithful ones in each dormant body do the necessary work promptly or wait for outside help? Is it not true that, if all our old workers would determine that every dormant Grange should be reorganized, the next six months would see nine-tenths of all these in successful working order? Deputies have an important duty to perform in this direction, and with them should start this movement. They are the ones to superintend the work. Much is being done, but more can be done by united effort.—*Grange Bulletin*.

THERE are other and most excellent farmers' associations, but the Grange has the high honor of being the oldest and longest tried. It has gone through its period of mushroom growth, with its consequent reaction and years of apathy, and has now taken on the development of mature years. In its adaptability to the largest number of farmers in all sections of the continent, the Grange is unrivaled.—*Farm and Home (Massachusetts)*.

REPORTS of new Granges, reorganizations, large accessions of new members, new halls being built, larger meetings, seaside, lakeside and picnic gatherings of Patrons and farmers, more and larger than ever before, the calls for lecturers, the more liberal space given to Grange news in local and other papers, all plainly prove the present advance of the Grange, and its growth in favor in all parts of the land.—*Farmers' Friend*.

SUGGESTIONS FOR THE GOOD OF THE ORDER.—Every Grange should have a press committee, who would carefully report for the local and agricultural papers all their meetings. Surely when there are discussions like those we have, an account of them would serve to prove that Grange meetings are not all forms and ceremonies, as some aver, and that they do not spend long evenings in foolishness as others say. Granges should try to recommend themselves to the public in every legitimate way.—*A Rhode Island Patron*.

PROGRESS.—One hundred and thirty-three new Granges organized in the United States this year. Forty-two more than in all of last year.

TURNER GRANGE, Oregon, has completed a new hall and received a class of eight new members.

THE annual cost of insurance in the Husbandman's Fire Insurance Co. of Vermont averages about \$1.66 per \$1000 of risk. The company began business in February, 1880, and has insured 871 policies, of which 604 are now in force, covering risks to the amount of \$777,050. The total expenses in the six years, including losses, have been \$8605.

"Their sound is gone out into all lands, And their words into the ends of the world."

MAGNOLIA GRANGE.—We learn from the *Auburn Republican* that the members of Magnolia Grange celebrated their twelfth anniversary at their hall across Bear river on the 9th instant. About 200 members and guests were present. Rev. Mr. Sherrard of Gold Hill read an essay, and addresses were made by Rev. C. L. Corwin and Senator Johnston, Master of the State Grange. Music and an elegant banquet completed the festivities.

MICROSCOPIC air and liquid bubbles exist in many crystals of minerals, no less than 4,000,000 having been estimated to have a place in a cube of quartz one-twenty-fifth of an inch square.

Joaquin Miller.

We had a call on Tuesday from Mr. Joaquin Miller, whom we mentioned last week as one of the delegates appointed by Gov. Bartlett to attend the Forestry Congress, which will be held next month at Springfield, Ill. Mr. Miller tells us that he returned to California to make it his permanent home and did not expect to cross the State line again, but his interest in forestry is so deep that he accepts with willingness the opportunity to consult with those who come together from all parts of the country with one grand idea, to preserve and multiply our tree growths. Mr. Miller has purchased a picturesque piece of hillside east of Fruitvale, near Oakland, land with jutting rocks and grass and plenty of living water, a place naturally so situated and conditioned that the tree-planter can work upon it effectively and produce most gratifying and picturesque results. Here he has reared his cathedral of unheavened rocks and planted his home, hoping to end his days in the balmy air and gazing upon the grand landscape which the elevation secures him. But with these desires Mr. Miller does not propose to withdraw from the busy throng. He has accepted the invitation to deliver the poem at the opening of the Mechanics' Institute Fair, and thereafter will go East to the Forestry Congress, and will also revisit the chief cities of the Atlantic Coast. A few weeks will, however, bring him again to the home of his choice in California.

Mr. Miller has been engaged as a regular contributor to the columns of the *Illustrated Weekly*, a new pictorial journal recently established in this city. The poem for the Mechanics' Fair opening exercises will appear in the issue of September 4th. His writings will present news, sentiment and comments upon topics affecting the best interests of mankind, and their style will, of course, be marked by the originality in thought and expression for which both Mr. Miller's prose and verse are proverbially inimitable.

Illness of the Governor.

Gov. Bartlett's health has been a source of anxiety to his friends for several months, and it is generally known that close attention to official duties had so reduced his strength that it became necessary for him to retire to Highland Springs for rest and recovery. He had rallied to some extent and was staying with a relative in Oakland, where last Monday night he was stricken with paralysis.

The stroke was so severe that for awhile his life was despaired of, but an unlooked-for change for the better soon became apparent, and as we go to press Wednesday afternoon, a dispatch, signed by the attending physician, Dr. C. Annette Buckel, says: "Governor Bartlett seems to be improving. The paralysis of the lips and face is slightly better; voice, more natural; pulse, 64; temperature, 99; respiration, more natural."

The present condition indicates an absorption of the blood-clot that caused the paralysis, and we hope that ere this reaches our readers there will be more encouragement to look for his recovery.

Gamblers at Odds.

The book-making and betting "sports" have fallen out at Monmouth Park, and the judges have refused to interfere, saying that they have no cognizance of the betting.

There is a proverb that when rogues fall out honest men get their dues, but we fail to see how it applies in this case, since no thoroughly honest man can have anything to do with the pools and wagers of the race-track.

As between the book-makers and the backers, we feel much like the frontierswoman who stood in the doorway of her cabin watching the knife and-claw tussle between her old man and Bruin, and clapped her hands as she cried out: "Go it, husband! Go it, bear! I don't care which licks."

The Fairs.

The Sonoma County Fair opened at Santa Rosa with high promise on Monday, and was, at last accounts, in prosperous course. We shall try to give an extended report in our next issue.

The Fourth, Eighth and Thirteenth District Fairs are to take place at Petaluma, Placerville and Marysville, respectively, the coming week.

The Mechanics' Institute Fair opens in this city next Thursday, September 1st, and will run until the 8th of October.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

GOOD GRAIN.—Haywards *Journal*, Aug. 20: The heaviest crops in this valley were around Mt. Eden and Haywards. The highest yield was 36 sacks to the acre, while a large number realized from 30 to 25 sacks and down to 20 sacks. As a sample, on Frank Dennis' place, the amount was 719 sacks from 20 acres. From 40 acres Mrs. Obermuller had 3030 sacks of barley, mostly chevalier. The crops of many others were above the average.

Butte.

GROWN UPON THE HILLS.—Chico *Enterprise*, Aug. 19: By Gibson's stage from Magalia today we received a box from the ranch of Mat and John Bader, containing Bartlett pears, winter apples and peaches. They are fine specimens of what can be done on the hills east of Chico, at 2400 feet elevation, and are a credit to the perseverance and industry of the Bader Bros., who were the first to appreciate the value of land in the foothills for agriculture, and purchased 160 acres which they cleared and put into hay, and on a part set out an orchard which now pays them good returns for all its cost.

THE CHICO CANNERY has nearly completed 200,000 cans, and 50,000 more will be added before the season closes, making a quarter of a million cans for this year's pack. Nearly all his lot has already been sold for the Eastern market, and had the capacity of the cannery been greater and the help sufficient, double that amount could have been put up. The orchards of the Rancho Chico supply nearly all the fruit, only plums and Bartlett pears having been brought in from outside orchards in small quantities. To handle all this fruit has required a very large force, and many needy families have been benefited, and a large amount of coin put in circulation among our merchants. The schoolgirls and boys have put in a profitable vacation, and probably learned habits of industry which will benefit them through life.

Calaveras.

JAPANESE EXPERIMENT FARM.—Valley Springs Cor. *Chronicle*: K. Inouye has bought 50 acres of improved land, with buildings, in this valley, stocked the property and brought two Japanese farmers to the ranch. He was interviewed the other day, but only stated that Japan considered it desirable to send out emigrants, and he intended to try the experiment and see if this would prove a good country for Japanese farmers to emigrate to. Mr. Inouye is an educated and intelligent man and influential among the Japanese. He says this is the first experiment by Japanese in farming in this country.

Contra Costa.

OUT ALL WINTER.—Martinez *Item*: As an instance of the mildness of Contra Costa's climate, Thomas Kilgore of Ignacio Valley has placed on exhibition, at the Board of Trade rooms, a pumpkin of last season's growth, well developed, perfect and in as good preservation to-day as it was last fall. It has remained out in the weather, we are informed, all the time, only protected by being in the lee of a fence.

Fresno.

NEW NECTARINES.—Fresno *Republican*, Aug. 19: W. C. West, manager of the Fancher Creek Nursery, lately left a sample box of nectarines at this office. It contained specimens of the Violet Gros nectarine, a new importation from France. It is a magnificent fruit, closely resembling a white peach in appearance, but having a rich and extremely agreeable nectarine flavor. It is of large size, and will rank among our best nectarines when introduced. There were also specimens of a new seedling propagated at this nursery. It is colored like the Lord Napier, but its flavor is more like that of the New White. They are both creditable specimens of this excellent fruit.

THE RAISIN PACK.—There has been a good deal of estimating done on the forthcoming raisin pack of Fresno. Last year the pack reached the figure of 252,000 boxes, and the increase of the bearing acreage is large. The lowest estimates are now from 300,000 to 400,000 boxes, and some place it still higher. An increase of 100,000 boxes would be doing well, and it is likely to exceed this.

Inyo.

PROMISING COLTS.—Bishop Creek *Register*, Aug. 18: This week Thos. McLeod purchased from Hor. Smith a 26 months-old colt. He is half Norman, coal black, and weighing 1198 pounds. The price paid was \$200. Wm. Rowan had a half-Norman colt in town, 26 months old, which weighed 1400 pounds. It was the property of Dugan & Blair. These are pretty hard to beat in the way of horseflesh.

ALEXANDER APPLES.—We were shown some apples yesterday from the orchard of J. W. Claussen of the Alexander variety. The largest measured 14½ inches in circumference, and 12 of them weighed 10 pounds and two ounces. Mr. Smith intends to send the fruit to San Jose—a good idea—and some of the same sort will be on exhibition at our fair this fall.

Kern.

A SAMPLE CORN-FIELD.—Bakersfield *Echo*: On P. D. Jewett's ranch, ½ of a mile north of town, is a crop of maturing corn that speaks truths concerning this valley, hardly credible to

those unacquainted with the strength of soil and favorable weather to be found in the upper San Joaquin. During the winter months barley was sown, from which a heavy crop of hay was harvested in May. The ground was then plowed and on the 10th of June was planted to corn. At this writing the stalks of corn, now only about six weeks from the planting of the seed, average 14 feet in height—many of them are 18 feet high—and bear three or four ears each. There is nothing extraordinary about this field; we cite it as an instance of what is accomplished all over this part of the State, where water for irrigation is at hand.

Los Angeles.

EDITORS PRESS.—The weather has again turned warm, with an absence of fog, which is a great favor to the fruit-driers; but the hay-baling will have to suffer. Two large land sales have been reported in our valley. The land will be subdivided and put on the market for this winter's immigration. This is a move that we hail with joy, as our neighbors are too far apart. An oil refinery is also talked of as an enterprise of the near future, which will add to the industry and wealth of our already busy county, and help give employment to the thousands who are coming in.—D. J. O., *Spadra*, Aug. 27, 1887.

A UNIQUE HIVE.—Los Angeles Cor. *Chronicle*: Mexicans have been selling honey pretty extensively here for a short time past. It was very nice honey, and many people, after tasting it, bought small quantities from the swarthy vendors. To-day a reporter had the curiosity to investigate and found that this honey had been made by a nest of ground-bees in a coffin in a grave in the Catholic cemetery. The sexton was not aware that the honey-sellers had been mining for sweets in his territory.

Napa.

WHEAT AND BARLEY YIELD.—*Calistogan*: Eight and nine years ago the yield of wheat per acre in the Upper Napa valley decreased so much that many farmers became greatly discouraged, and turned their attention to other crops. Now, however, land is producing wheat very well again, but of course not so abundantly as it did 20 years ago. The increase is attributed mainly to the fact that land has been given a rest by growing grass, etc. The following are fair specimens of the wheat and barley yield here this year: J. R. Wright, 70 acres of wheat, 20 of barley; sacks of wheat and barley from the 90 acres, 1365. Ephraim Light, 10 acres barley; sacks, 250. David Rose, 38 acres wheat; sacks, 465.

Placer.

PLACER PEACHES.—*Republican*, Aug. 17: Last Saturday we received a box of non-irrigated peaches from Jack Lower, whose place is just below Auburn. They were freestones of the Rice variety and two layers filled a six-inch box. They averaged 11 inches, and one Orange cling measured 11½ inches in circumference. ... In J. F. Madden's store at Newcastle last Friday was a lot of fruit gathered from different ranches which was a whole fair by itself. In the display was a McDevitt cling peach, from Walter Connelly's ranch, which measured 131 inches in circumference and weighed 17 ounces. An Orange cling from M. Pranzo's place measured 12 inches and weighed 15 ounces. A Tingley peach from W. E. Ritchey's orchard measured 11½ inches. Three McDevitt peaches from Mr. Armes' place weighed two pounds and five ounces. Five Chili cling peaches from Peter Hallbom's orchard weighed a trifle over three pounds. ... Monday morning R. N. Scott brought to this office a brace of McDevitt clings which measured an even 12 inches in circumference. If any more big peaches come in, the *Republican* intends to start a cannery.

Sacramento.

FRUIT-BOXES IN DEMAND.—*Bee*, Aug. 19: The unprecedented fruit crop of this year, and the constant shipment of trainloads to the East, have produced the greatest activity at the box-factories in this city. Boxes of all sorts and sizes are turned out daily by thousands, and the demand far exceeds the supply. One of the proprietors of the Pioneer box-factory said that it was utterly impossible to fill all orders received. They have two mills, one constantly engaged in cutting lumber to proper sizes, while at the other the planing, nailing, etc., is carried on. These mills are run day and night, with an employe wherever one can be placed, and the payroll amounts to \$700 per week. The orders for boxes come from fruit merchants of this city, and from growers and shippers of all the surrounding counties. At the Capitol box-factory the reporter found the same rush and bustle. It seemed as if rough lumber were going in at one end of the mill and coming out transformed into boxes at the other. "We have all the work we can attend to," said foreman Crone, "and have advertised for additional help, that we may put on a night force. Why, there is one order, received two months ago, for 250,000 raisin-boxes, and we haven't been able to touch it. We have used 220,000 feet of lumber every month this season, and will far surpass that amount the present month."

WANTS HOP-PICKERS.—A. Menke of this county, the most extensive hop-grower in the world, has advertised for 400 white persons to pick hops. He does not bar out any nationality except Chinese. Arrangements have been made to open a boarding-house on the ranch, at which board may be had at \$3.50 or \$4 per week. Mr. Menke especially asks that families come out and engage in the work, which is light; children can engage in it as well as older

persons, and it would be something like a camping-out picnic. The weather will admit of comfortable living in tents and a family could make a nice little stake during the four or five weeks of hop-picking. The price offered—90 cents per hundred pounds—is all that can be afforded in the present condition of the market.

THE WHEAT CARRIED.—*Record-Union*: An idea of the amount of wheat that is being brought down from the upper Sacramento and Feather rivers may be gained from the fact that during the month of July 38 barge-loads came to the city, and up to yesterday noon, 26 had arrived so far this month. Two of these barges will carry 1000 tons each; others 800 or 900 tons, and some are smaller. Those from the Feather river, of which, however, there have been only one or two per week, will carry 500 tons or more. Averaging all the barges at 700 tons each, the total grain brought down would amount to 44,800 tons.

A WEE JERSEY.—*Record-Union*, Aug. 22: W. W. Connor, at K and 23d streets, owns a diminutive Jersey calf which is believed to be the smallest for its age known. Hundreds of people have called at Mr. Connor's premises to see it. It is now over three weeks old, has always been in excellent health, and is as frisky as any. It was measured last Saturday and found to be but 17½ inches in height, and two feet from the tip of its nose to the end of its back.

San Diego.

OLIVE OIL.—National City *Record*, Aug. 18: Frank A. Kimball shipped from his works this week quite a large quantity of bottled olive oil. Mr. Kimball and Elwood Cooper find the demand for pure olive oil so great that both manufactories cannot begin to keep up the supply.

POTATOES.—We have frequently been asked by new-comers: Will potatoes grow here? Everybody who has planted potatoes can testify that they will. The Italian ranchman Denario, on the Otay, has made a bushel of money growing potatoes. The other day a sample of what the Tia Juana will do was left at this office by R. C. Clark, and such potatoes, one of them would make a meal for the heaviest representative of the old sod that ever drove a spike on a railroad.

San Luis Obispo.

CRESTON CROPS.—Cor. *Tribune*: The big steamer-thresher of Moody & Co. is in the valley devouring the stacks of headed grain, and the way the crop is turning out makes the average rancher very happy. Not only are they getting an extra quality of grain, but the quantity is above all their calculations, and a good many extra sacks will have to be obtained. There has been a large quantity of hay baled in this section and there is a good demand. Hay is selling readily for \$12 per ton, with a fair prospect of an advance. Pasturage is good and abundant. Heper, Jackson & Co. have brought their large band of sheep from their ranch to this place to pasture. The band is said to number about 6000 head.

FROM THE HUASNA COUNTRY.—E. W. Black informs the *Tribune* that the Huasna is rejoicing in splendid yields of all kinds of grain. Trussell & Brown, from 300 acres, have harvested 5000 sacks of barley, and the Steele Bros., who ordered but 5000 sacks from San Francisco, found out, when it came to thrashing, that they were 3000 short. Eight thousand sacks of wheat from 400 acres is considered exceptional.

Sonoma.

HANSELL RASPBERRIES.—*Petaluma Courier*: Dorr Hakes has a 5½-acre raspberry patch near Valley Ford, from which he has picked and marketed 200 chests. The average price received was \$6 per chest, or \$1200 for the entire crop, equal to about \$245 per acre. The crop was picked by girls who live in the neighborhood, from 12 to 14 of them being constantly employed. They were paid according to the quantity picked. None of them, we are informed, make less than a dollar a day, and some expert pickers considerably more. His vines are of the Hansell variety and the fruit is large, of a deep-red color and fine flavor. They bear enormously and the crop lasts for several weeks.

PROLIFIC PLUMS.—*Record-Union*, Aug. 22: A cluster of plums grown upon I. N. Curtis' farm, one mile from Healdsburg, is quite a curiosity. The cluster consists of a limb from a Hungarian plum tree, the branch being about 20 inches long and the fruit grown thick in a solid mass about six inches in diameter, the entire length. The branch is almost as heavy as if it were one solid plum six inches in diameter and a foot and a half long.

Tulare.

VISALIA JOTTINGS.—*Times*, Aug. 18: Samuel Hall has purchased three head of Polled Angus cattle, with the idea of improving the breed of stock on his mountain ranch. ... L. Samuels of the Paradise store had on exhibition, Saturday, a muskmelon that weighed 46 pounds. ... Among the deliveries at the cannery this week there was box after box of peaches weighing from 12 to 16 ounces each. In 100 pounds of the fruit weighed there were only 130 peaches, and it was not a selected lot, either. ... The Visalia hog market is lively, two to five carloads being shipped to S. F. daily. The ruling price this week has been about four cents, with a slight advance for choice lots.

GETTING CATTLE FOR WORTHLESS CHECKS.—Tulare *Register*, Aug. 19: C. W. Welby has

been in this neighborhood buying cattle of the ranchers and paying in checks drawn on Crocker, Woolworth & Co., bankers, S. F. Yesterday he purchased stock from H. McNulty to the amount of \$1011, and from John Thompson, S. S. Slinkard and Cyrus Guthrie to the amount of \$800, for which he gave checks as usual, telling the gentlemen to telegraph to S. F., and satisfy themselves the money was there. This they did, and while awaiting an answer Welby loaded the stock into four cars and started with them for the bay. Late in the afternoon an answer was received from the S. F. bank, saying that Welby had been a depositor with them, but had exhausted his account. The amount involved was so large that the owners of the stock, while convinced that Welby did not intend to rob them, but was the victim of a mistake somewhere, did not feel it safe to take the risk of his paying them when he reached home and learned the condition of affairs, so they swore out a warrant charging him with obtaining the stock under false pretenses, and signing over their checks to Officer Tompkins, started him after Welby, who was stopped with the stock at Lathrop, by telegraph. Mr. Tompkins will accompany Welby to S. F., providing the case is as supposed, and bring back the money, otherwise he will bring back the man and stock.

Yolo.

MULE MARKET.—Woodland *Democrat*, Aug. 18: Wednesday morning two lots of mules were led by this office. The first contained two large spans, as noble-looking animals as one would wish to see. One span were dark iron-grays, and seemed proud of their lot in this world of trouble. They were bought of E. R. Lowe, and the price paid for the two spans was \$1000. The second lot of five was bought of Pace & Cramer. They were large, of dark colors and a credit to the parties who raised them, as well as to Yolo county. The price paid for the lot was \$1200. In a few minutes along came a span of bright bays, whose heads were so high that one had to look up to see the tops of their ears. They were four and five years of age, and a nobler span one seldom sees in any country. They had not been sold and were the property of Charles Woods.

CAPAY FRUIT.—J. Henry, who resides seven miles up Capay valley, brought this office samples of apples and peaches which speak well for that locality. The apples were extraordinarily large and well flavored, and were of the Duchess of Oldenburg variety. The peaches were of the China cling variety and were also of good size and well flavored.

NEVADA.

HAY.—Reno *Stockman*, Aug. 17: E. W. Crutcher, who has the largest and best hay ranch in Paradise valley, states that he will have an average crop of hay and grain this season. He has already about 1000 tons of hay in the stack. ... Native grasses are not doing as well as expected this year. There will consequently be a shortage in the native hay crop. ... Six tons of alfalfa to the acre, two cuttings, have been harvested by several Washoe valley farmers this season. Four tons will be about the average yield in this valley. ... Stockmen are purchasing alfalfa in large quantities for fall feeding. The ruling price is said to be \$6.25 a ton in the stack.

WILD CLOVER is said to be quite plenty in the river bottoms, and unless some action is taken by our farmers to eradicate it, it is liable to cause them considerable trouble. It grows to a height of from 11 to 12 feet, and is unfit for feed, the fibers and stalks hardening to the consistency of wood when cut. One stalk in a field will ruin it for the growing of grain or alfalfa, as it is a great seeder and rapid producer, and will, in a short time, kill off less hardy plants. Farmers should be on the lookout for it.

OREGON.

HOPS.—Telegram from Portland, Aug. 23: The first bale of Oregon hops for this season was shipped East to-day. It is from Lane county. It is impossible yet to give the figures on the output of this State. The yield is not quite so heavy as last year, but the acreage is larger, and it is thought that last year's figures, 12,000 bales, will be reached.

Admission Day Proclamation.

WHEREAS, It has become the custom to celebrate, each year, the anniversary of the admission of the State of California into the Union; and

WHEREAS, A large number of citizens have requested, in order that all persons may participate in the ceremonies and festivities common to such occasions, that such day be set aside as a legal holiday:

Now, therefore, I, Washington Bartlett, Governor of the State of California, by virtue of the authority in me invested by the Constitution and laws of this State, do hereby appoint and declare Friday, the ninth day of September, A. D. 1887, a legal holiday.

In witness whereof, I have hereunto set my hand and caused the seal of the State to be hereunto affixed this the 15th day of August, A. D. 1887.

WASHINGTON BARTLETT, Governor.

Attest: W. C. HENDRICKS,
Secretary of State.

A Farmer's Wife.

The farmer came in from the field one day,
His languid step and his weary way,
His banded brow and his sinewy hand,
All showing his work for the good of the land;
For he sows,
And he hoes,
And he mows,
All for the good of the land.

By the kitchen fire stood his patient wife,
Light of his home and joy of his life,
With face all aglow and busv hand,
Preparing the meal for her husband's band;
For she must boil,
And she must broil,
And she must toil,
All for the sake of the home.

Sun shines bright when the farmer goes out,
Birds sing sweet songs, lambs frisk about,
The brook babbles softly in the glen,
While he bravely works for the good of the men;
For he sows,
And he hoes,
And he mows,
All for the good of the land.

How briskly the wife steps about within—
The dishes to wash and the milk to skim,
The fire goes out and flies buzz about—
For dear ones at home her heart is kept stout;
There are pies to make,
There is bread to bake
And steps to take,
All for the sake of the home.

Then the day is o'er and the evening has come,
The creatures are fed and the milking is done;
He takes his rest 'neath the old shade tree,
From the toil of the land his thoughts are free;
Though he sows,
And he hoes,
And he mows,
He rests from the work of the land.

But the faithful wife, from sun to sun,
Takes the burden up that's never done;
There is no rest, there is no pay,
For the household good she must work away;
For to mend the frock,
And to knit the sock,
And the cradle to rock,
All for the good of the home.

When the autumn is here with chilling blasts,
The farmer gathers his crops at last;
His barns are full, his fields are bare,
For the good of the land he ne'er hath care;
While it blows
And it snows,
Till the winter goes,
He rests from the work of the land.

But the willing wife, till life's closing day,
Is the children's and the husband's stay;
From day to day she has done her best,
Until death alone can give her rest;
For after the test
Comes the rest,
With the blest,
In the farmer's heavenly home.

Uncle Nahum's Wedding.

Uncle Nahum Nixon was reading the paper in his back parlor. Nobody would think, to look at the simple surroundings of the unpretentious apartment, that Mr. Nahum Nixon was one of the wealthiest men in town. The carpet, it is true, was Axminster, but it had seen 22 good years of service, and was down to the very warp; the faded red curtains were of moreen, instead of silk damask; the old clock on the mantel was no Parisian affair of alabaster and gilt, but a substantial Connecticut timepiece that struck with a whirr, like a partridge springing out of her nest; the chairs of old-fashioned mahogany and haircloth stood upright against the wall; the portraits of Gen. Washington on horseback and the surrender of Cornwallis, ornamented the gay papered walls in frames of somber gilt, and the one elegance of the apartment was a preposterous bouquet of wax flowers under a cracked-glass shade.

But Uncle Nahum had remembered that furniture ever since he was a child, and he wouldn't have exchanged it for the fittings of a Parisian boudoir, or the choicest specimens of the modern Eastlake pattern. He was a rich man, that was quite enough for him.

"If you please, Mr. Nixon," said the trim maid-servant, "Mr. Marmaduke Bourne wants to see you, if you please, sir, if you are quite at leisure."

"Mr. Marmaduke Bourne, eh?" The old gentleman took off his spectacles and laid them upon the folded newspaper. "Ask him to come in, Polly."

And Mr. Marmaduke Bourne came in, a tall, fresh colored young fellow, with sparkling gray eyes and a straight Greek nose, that seemed as if it had been borrowed from some ancient statue of Apollo.

"Well, sir?" said Mr. Nixon.

"Well, sir?" counter-interrogated Mr. Bourne, "did you get my letter?"

"I got your letter," said Uncle Nahum. "So you want to marry my niece, Faith?"

"Yes, sir," valiantly acknowledged Mr. Marmaduke Bourne.

"Ah!" nodded Uncle Nahum. "But perhaps you don't understand all the facts of the case."

"The facts, sir?"

"I want my niece to marry Col. Ashland's son," slowly enunciated Uncle Nahum.

"But, sir, she don't love him."

"Pshaw!" snarled Uncle Nahum. "And if she don't marry him she will be a beggar; I will give her no money of mine. Now you understand matters. Marry her or not, as you please."

He took up the newspaper once more—a tacit intimation that the interview was at an end.

"Sir—" began Marmaduke.

"That will do," said Mr. Nixon.

"I only wish to—"

"That will do," thundered Mr. Nixon, and so Marmaduke went away.

Little Faith Nixon came downstairs presently, a blue-eyed blossom of a girl, with yellow hair growing low down on her forehead, and a very little mouth, exactly the shape to suggest the idea of kissing.

Uncle Nahum looked keenly up at her as she fluttered about the room, straightening a table-cloth there or patting down a fold here.

"Yes," said he, with a curious twitch of the muscles around his eyes, "he has been here."

"I—I did not ask any question, Uncle Nahum."

"No, but your eyes did," chuckled the old man. "He wants to marry you—the im-provident young donkey."

Faith came to her uncle's chair and laid her hand on his shoulder.

"That is not the worst of it, Uncle Nahum—I want to marry him."

"Humph!" snarled Mr. Nixon, in high contempt. "And what do you expect to live on, I should like to know?"

"We can both work," said Faith bravely.

"You're more likely to starve," said Mr. Nixon. "Mind, don't count on help from me. If you will get married, you do it at your own risk."

"Then you consent, Uncle Nahum?"

"No!" roared the old bachelor. "Nothing of the sort."

"But, Uncle Nahum, I should be wretched without Duke!" softly pleaded Faith.

"Fiddlesticks!" said the old man.

"And I'm sure he couldn't live without me."

"Trash!" grunted Mr. Nixon.

"And if you please, uncle," added Faith, "perhaps I'd better go to my friend Violet Smith's to make up my wedding things, since you disapprove so decidedly of my plans. She lives in New York, you know, and it will be convenient for shopping, and—"

"And for all other tomfooleries in general," rudely interrupted the old gentleman. "Yes, go to your Violet Smith's, but don't expect to come back here."

"No, uncle," said Faith, meekly. "But you'll let me thank you for all your kindness, and—"

"No, I won't!" said Uncle Nahum, so shortly that poor Faith fled upstairs in dismay, and had a quiet little cry, notwithstanding that she was so very, very happy.

For Uncle Nahum, brusque and crabbed though he was, was all the father she had ever known. But she packed her trunk and went to Violet Smith's in New York, which was all the pleasanter, in that Marmaduke Bourne had also betaken himself to this modern Gotham and gone to work studying law as if he meant to take Coke and Blackstone by storm. And Miss Violet Smith, who was a sentimental young lady, sympathized intensely, and the young couple were as unreasonably happy as many another couple has been before, and will again.

But one day Duke Bourne came in with a face full of tidings.

"Faith," said he, "have you heard the news?"

"What news?" asked Faith.

"Your uncle will get the start of us after all."

"What do you mean, Duke?"

"Why, he's going to be married."

"Uncle Nahum?" cried Faith, incredulously.

"Yes, Uncle. That accounts for his being so willing to get rid of us, eh, little one?"

"And who is the bride?" questioned Faith.

"Why, that's the mooted point yet. Nobody seems to know. Some say one and some say another; but the general impression seems to be that it is the rich widow who owns the brown-stone block on the corner."

"I'm sure I hope he will be happy," said Faith, with tremulous lips and eyes suffused with tears. "But—but I think he might have said something to us about it."

"People are not generally in a hurry to proclaim the fact that they are about to make fools of themselves," said Duke Bourne, bitterly.

"Why," cried Faith, laughing through her tears, "that is precisely what he said of us."

But the next day a letter from Uncle Nahum himself settled the matter. He wrote:

"There is to be a wedding at my house on the 17th, and I want you and Marmaduke to be there without fail."

"A wedding! At his house!" cried Faith.

"I supposed weddings were celebrated at the bride's residence."

"So they are, dear," said Miss Smith; "but your uncle was always so eccentric."

"What shall we do?" asked Faith.

"Why, go, of course," said Marmaduke Bourne, "to show that we bear no ill-will, if for no other reason."

The 17th of March arrived, a cold, blustering night, and the old red-brick house was all in a glimmer of light as the young betrothed pair drew up to the door. Uncle Nahum met them on the threshold, in his old-fashioned, swallow-tailed coat, with a huge white camellia in his buttonhole and a pair of surprisingly white kid gloves.

"Have you brought your white frock?" was his first question to his niece.

"No, uncle, I—"

"That won't do," said Uncle Nahum. "No one must come to my wedding without a marriage garment. It's lucky I provided one for you. Come upstairs now and change your dress."

"But uncle, a white silk!" cried Faith, looking in dismay at the glistening dress laid out for her use.

"What then? Isn't white silk the thing for a wedding? Put it on quick, and I'll send some one to bring you down in five minutes."

And so, with a doubting heart, Faith Nixon robed herself in the white dress, with its trimmings of vapory blonde and long trail.

"Where's your veil?" said Uncle Nahum, when he came himself, a few minutes later, to the door.

"Uncle, I can't wear a veil," pleaded Faith.

"But you must!" said Uncle Nahum; "nobody comes to my wedding without a veil," and he placed the wreath lightly on her head.

"But, Uncle Nahum, they will take me for the bride."

"Let 'em," said the old gentleman. "Take my arm. Now come downstairs, and I'll show you the bride. Here she is."

Lifting her bewildered eyes, Faith Nixon beheld her own figure reflected in a full-length mirror at the stairway.

"Here's the bride," chuckled Uncle Nahum, leading her up to Bourne, "and here's the groom," touching Bourne's shoulder. "And here's the parson, all ready and waiting. Now, reverend sir," to the clergyman, "marry 'em as fast as ever you can." And before either of the astonished young couple could remonstrate they were made man and wife.

"Duke," said the bride as soon as the ceremony was over, "did you know of this?"

"No, I didn't," said Mr. Bourne, with his arm very tight around his little wife's waist. "But I must say I approve very highly of the whole proceeding."

Uncle Nahum stood by, rubbing his hands, with his face wreathed in one prodigious smile.

"So you supposed it was I who was to be married, eh?" said he. "Not a bit of it, not a bit of it. I am too old a bird to be caught with such chaff as that. No, no, little Faith. Did you think I was going to turn my wee birdie out of her nest, after all the years she has been cherished there? No, no, I only wanted to assure myself that your fancy was a real fancy, and this young rascal here," smiting Bourne on the shoulder once more, "loved you for yourself alone, and not for the money which he thought the old man was going to leave you. And you're to live here, both of you, and we will be happy ever after. Strike up your harps and fiddles. Let's have a dance, let's all be merry together."

Uncle Nahum Nixon himself led off the bridal quadrille, dancing in the good old style of 50 years ago.

"I can't have a wedding every day," said Uncle Nahum, breathlessly, as he cut a last pigeon-wing, "and I mean to make the most of it."

A FEMALE HORSE TRAINER.—The Adin *Argus* publishes an article concerning Mrs. Pete Shafer, who formerly resided at Etna and whose wonderful equestrian feats made her famous throughout the county. She will be especially well remembered by Yreka, having conducted a horse-training school here. One of her achievements was to take the wild, unbroken animal that could be obtained, and in four hours drive it through the streets with a tin can tied to its tail. The *Argus* article is as follows: It is seldom that a woman is found who is as fearless and as good a "broncho" rider as any of the vaqueros, but Modoc has a resident, living near Happy Camp, who, in riding, can equal any vaquero or horse-trainer to be found. She is married and lives on a ranch with her husband, a Mr. Shafer. As their home is distant from any settlement, she has acquired the habit of riding astride. According to her story, she has been offered a large sum to ride in the San Francisco park, but says: "You don't catch me going down there to make a fool of myself." She is surely an exceptional woman, and is entertaining to persons who may stop while passing over the public road there. She has no scruples to plowing with a four-horse team while the men lie under the shade of a tree and enjoy an afternoon smoke. If out of meat she will take a gun, mount her horse and soon return with a venison. Mrs. Shafer at one time followed the millinery and dress-making business in Oregon before coming from that State to Modoc.—Yreka Union.

In filling out a death certificate, a Buffalo physician attested that the contributing cause of death was a croup cure made and sold by another doctor of the same city.

THAT is false liberty which brutalizes humanity.

A B C of Astronomy—No. 3.

[Written for the RURAL PRESS by ASTRON.]

The next circumpolar constellation which merits our attention is Cepheus. The following diagram will help you to locate it:

You will observe that the constellation consists principally of three stars, forming a segment of a large circle between Cassiopeia and the pole star. B in Cepheus is a double star of the third and eighth magnitudes. [The fixed stars are classified, according to their brightness, as stars of the first magnitude, the second magnitude, and so on. This classification is somewhat vague and arbitrary. The smallest stars which the naked eye of average power can distinguish are usually ranked as of the fifth magnitude—all below that are telescopic.—EDS. PRESS.]

The northern hemisphere is more favored than the southern with stars of the first magnitude; the former having 14, the latter only seven. The northern are named as follows:

1. Sirius in the Greater Dog (Canis Major).
2. Arcturus in Boötes.
3. Vega in Lyra.
4. Capella in Auriga.
5. Rigel in Orion.
6. Aldebaran in the Bull.
7. Betelgeuse in Orion.
8. Antares in the Scorpion.
9. Procyon in the Lesser Dog (Canis Minor).
10. Altair in the Eagle.
11. Spica in the Virgin.
12. Regulus in the Lion.
13. Fomalhaut in the Southern Fish.
14. Castor in the Twins (Gemini).

All the stars in the northern hemisphere will be visible at reasonable hours of the evening as the seasons advance, and will be very interesting objects for study.

We have been enabled to go on thus far in our investigation of the heavenly bodies without any instrumental assistance to the eye, but to make any real progress, we should have a telescope to assist us. This is absolutely necessary in observations of the moon, the planets and the double and variable stars. Where the expense of buying a good astronomical instrument is beyond the means of the individual reader of these lectures, I should recommend the formation of an astronomical club among the neighbors, if possible, and by their joint contributions, the purchase of a good "achromatic" of not less than 2½ inches aperture. With this instrument you would be able to do good astronomical work.

Parties who are not so fortunate as to get a telescope, however, will find it interesting to read what I may write on subjects requiring its use.

I will now go more fully into what astronomers technically call alignment, to enable us to find the position of the stars. The first to engage our attention will be Arcturus, a star of the first magnitude in the constellation of Boötes (No. 2 on our list, passing Sirius for the present). First find the Great Bear (see RURAL PRESS of June 25, 1887), and from the last star in its tail continue on a curve line for nearly twice the length of the tail, and you will come to a very brilliant star. This is Arcturus.

The second star is Vega in the constellation Lyra (No. 3 on the list). A line drawn through Phegda and Megrez in the Great Bear goes very near to Vega. This is a splendid star, and a very conspicuous object among the heavenly bodies. When once found it will ever afterward be easily recognized. At 9 o'clock in the evening, in the middle of August, it is almost directly overhead. Face the pole star at that hour and look straight upward for it—it outshines all its neighbors.

If you have a telescope sufficiently powerful you will find one of the small stars close by Vega to be what is called a double double; that is, with the low power you resolve the star into two, and each of these can, with a higher power, be resolved into doubles.

[Draco, the last of the groups about the pole, occupies the space between the Two Bears, Cepheus and Vega. It is too rambling and irregular for us to present it in diagram, but it can be traced on stellar maps or the celestial globe, some time when you have access to such conveniences.—EDS. PRESS.]

I recommend the student, by close observation, to become thoroughly conversant with the circumpolar constellations, so as to recognize them without difficulty. This will be of great help in his future studies.

No science manifests at once the littleness and greatness of man as does astronomy. I do not think I shall be far wrong in considering it the most ancient of the sciences. At its very outset it was wrenched from its true purpose to minister to a great superstition of early ages—the desire to predict future events, especially the fortunes of men. Thus commenced the

pseudo-science of astrology. For a long period astronomy was made the mere handmaid of astrology, and although the latter has now comparatively faded out, there are many, even at the present time, who believe our destiny is connected with the starry and planetary worlds. It prevailed among the nations of the East, Egyptians, Chaldeans, Hindus and Chinese, at the very dawn of history. The Jews became much addicted to it after their captivity. It spread into the west and to Rome about the beginning of the Christian era. Astrologers played an important part at Rome, where they were called Chaldeans and mathematicians, and though often banished by the Senate and Emperors, under pain of death, and otherwise persecuted, they continued to hold their ground. The Roman poet Manilius, author of an astronomical poem still extant, was addicted to astrology. And even Ptolemy, the astronomer, did not escape the infection which in his time had become well-nigh universal. It accords well with the predestinarian doctrines of Mohammedanism, and was accordingly cultivated with great ardor by the Arabs from the seventh to the thirteenth centuries. Some of the early Christian fathers argued against the doctrine; others received them in a modified form. In its public capacity the Catholic church several times condemned the system, but many zealous Catholics, even churchmen, have cultivated it. Cardinal d'Ailly, the eagle of the doctors of France (died 1420), is said to have calculated the horoscope of Jesus Christ, and maintained that the deluge may have been predicted by astrology. For centuries the most learned men continued devoted to this delusion. Regiomontanus, the famous mathematician, Cardan, even Tycho Brahe and Kepler, could not shake off the fascination. Kepler saw the weakness of astrology as a science, but could not bring himself to deny a certain connection between the position of the planets and the qualities of those born under them. The Copernican system gave the death-blow to astrology.

Woman's Love.

Oh, say not woman's love is bought
With vain and empty treasure.
Oh, say not woman's heart is caught
By every idle pleasure.
When first her gentle bosom knows
Love's flame, it wanders never;
Deep in her heart the passion glows;
She loves, and loves forever.
Oh, say not woman's false as fair,
That like the bee she ranges,
Still seeking flowers more sweet and rare,
As fickle fancy changes.
Oh, no! the love that first can warm
Will leave her bosom never;
No second passion e'er can charm,
She loves, and loves forever.

THE KNACK OF READING FAST ought to be more encouraged in schools. Aloud, for the benefit of others, the child should be taught to read as slowly as the intelligence of the particular audience in view may seem to require; but silently and for his own benefit, he should learn to read like lightning. I would set a class of reading a page or passage "to themselves," and whoever could prove, by giving an accurate account of the matter some time afterward, that he had read thoroughly, and still had come out ahead, should be (as the boys say) "the best fellow." Again, I notice that some people have to read any item or article in a paper "clear through" to see whether it is anything they want to read; and only to find, generally, that it isn't. One should learn to find out by the ear-marks in the twinkling of an eye. In doubtful cases this can commonly be tested by the end better than by the beginning. Of course there are many cases not in the least doubtful, where the heading, or the first sentence, assures you that this is one of those things that seem intensely interesting to newspaper writers, but are of no earthly interest to any other human intelligence.—*Atlantic*.

HINTS FOR THE SLEEPLESS.—Edward Everett Hale says: "Never go to bed in danger of being hungry. People are kept awake by hunger quite as much as by a bad conscience. Remembering that sleep is the essential force which starts the whole system, decline tea or coffee within the last six hours of going to bed. Avoid all mathematics or intricate study of any kind in the last six hours. This is the stuff dreams are made of, and hot heads and the nuisance of waking hours. Keep your conscience clear. Remember that because the work of life is infinite you cannot do the whole of it in any limited period of time, and therefore you may just as well leave off in one place as another."

A ONE LEGGED beggar in St. Louis became so urgent in his demands for aid that he was arrested. When the police searched him they found 15 tobacco bags in his pockets and sewed to his ragged clothes, and each contained some money. The total amount was over \$70.

EVERY day the value of newspaper advertising becomes more apparent. A few days ago a lost canary flew into the composing-room of the *Republican* at Darlington, Wis., while the compositor was setting up an advertisement for it.

"A BOY assassin hanged," read Mrs. Bascom from the newspaper. "Well," she remarked, "a assassin' boy is a great trial, but I don't think he ought to be hanged for it."

YOUNG FOLKS' COLUMN.

"Ellen Newson's Dilemma."

(Written for the RURAL PRESS by "THORN.")

Ellen Newson, a girl of 16 years, was leaning her brown head up against the window pane in her room. You could easily see that she was trying her way out of an obstacle, which I am afraid she could have easily helped.

"Now here is mother's birthday in a few days, and not a cent have I for a present," said she, taking out her purse. "If I only had a little more lace I might make an apron out of this satin, but not a cent to get lace or anything else," cried poor Ellen, tossing herself on her bed. "I suppose I will have to ask papa for a few dollars, and then he'll ask me to show him my account-book, and then not a cent will I get."

Mr. Newson was a strict business man, and whenever his children wanted more money than their week's allowance, they had to show their account-books.

"Oh! that lunch-bell, and now I had better stop my crying," said Ellen, jumping from the bed.

That afternoon Harold and Ruby, Ellen's younger sister and brother, asked her to go with them to buy their presents for mother.

"I believe I will buy that book of engravings that mother was looking at the other day at Mr. Buford's art store," said Harold.

"But it was \$9, Harold, and you have not enough money; so I will put my money with yours and then we can get it," said Ruby.

"Yes, Harold, you had better do as Ruby says; it will be a beautiful present," said their older sister.

So the beautiful book of engravings was bought, and put away for the time to come.

"I will try, anyway," Ellen Newson was once again in her room. Her face had a smile on now—not a frown as in the morning.

She had been reading her favorite story-paper, and as she glanced over the advertising page, her eyes rested on a paragraph which made her face beam with joy. The editors of the paper had offered \$50 for the best story written by girls. "Why not write about papa's adventure while crossing through Mexico?" Ellen said thoughtfully. "I'll try it, anyway. Fifty dollars is worth trying for, and then my other manuscript has been printed."

Ellen Newson wrote her story and waited every day for the postman, to see what news he might bring her. The only consolation she had were the three words which she constantly repeated: "It might be."

Saturday came, the day before mother's birthday. Ellen's cheeks glowed with excitement. Surely she would be notified to-day, for the advertisement said so.

At last the postman came.

"My darling children!" said Mrs. Newson, as her children kissed and hugged their mother Sunday morning. One package after another was opened. Ellen seemed ready to cry with joy. At last!

Mrs. Newson opened an envelope which contained a check for \$50 and a very kind note, telling Ellen how much of a success her story would be, written by Mr. Norton, the editor of the paper.

"My dear, dear child!" cried Mrs. Newson, caressing her daughter.

So Ellen was rewarded. She tried.
Island Home Farm.

A Story for Little Ones.

(Written for the RURAL PRESS by D. A.)

"Tell us a story, mamma," said little May.

"Yes," chimed in Dolly, "tell us a story."

"Well," said mamma, after thinking a moment, "when your Uncle Dick and I were children, we lived in Ohio, and I'll tell you what happened in the spring of the year, when there was high water. It happened that our grandfather's cat was over at our house, and one night, to our delight, she had six kittens. We thought, of course, grandfather would be delighted, so we thought we would go over and show them to him. So we divided them three apiece between us, and we went to show them to grandpa. He was sitting out on the porch reading when we came, and when he saw the kittens he said: 'Ugh! the nasty things—throw them in there,' meaning the pond. Well, we thought as it was grandfather we couldn't disobey, so we threw them in. And then we ran away, because we didn't like to see them drown. After awhile we came back to see if they were drowned. But no, there they were, swimming on the water. At that we began to cry and take off our shoes and stockings; and we waded in and caught them. We didn't dare to take them home, because we had such a lot of cats. Well, we knew where there was a hollow stump in the field, so we concluded that we'd keep them in that.

"I took my apron off and put it in the stump, and then we put the kittens in. Those kittens lived three days, and this is the way we kept them that long:

"One day a peddler came along and grandfather bought us each a tin dipper. We would go out in the fields and milk the cows till we had our tin dippers full, and then we'd hold

the kittens' mouths open and pour the milk down their throats.

"As I said, they only lived three days, when they died. I sacrificed every one of my doll's best dresses, white ones and all, to lay those kittens out, and I took a quilt that had taken me all winter to make to wrap them in."

"Did they ever ask you what became of your apron and doll's clothes?" asked May.

"Yes," said mamma, "but I didn't tell."
Lompoc, Cal.

A Scholar in Earnest.

EDITORS PRESS:—As your valuable paper devotes some space to the young people, I write you a few lines.

Of the 29 graduates from the Sacramento High School July 28th, there was one especially who well earned his diploma. Arthur D. Murphy of Brighton went through the three years' course of study, traveling about 7000 miles with his pony and open cart. His daily drive was 13 miles, through winter storms and hot summer sunshine, and he was absent only four days in three years until last July, when he was down with a fever for three weeks. He was, however, able to be present at the closing exercises and received his diploma. During the three years he was only one night away from his home. On Saturdays and during vacations he worked on the farm assisting his father. I have seen him almost daily going to and from school, and have never seen the baneful cigarette or cigar in his mouth. His parents may well feel proud of him.

He rode 7000 miles for his diploma, and he got it. Who can beat his record?

OBSERVER.

Brighton, Sacramento Co., Aug. 17, 1887.

GOOD HEALTH.

Dangers to Health.

When will danger to health from sophistication stop? The example of the baker at Philadelphia, who poisoned his two children and his customers last week by covering his buns with chromate of lead instead of saffron, will not deter others from thus tingeing their cakes. With diarrhoea germs in our water, plaster of Paris in our bread, tyrotoxin in our milk, pneumonia in our beef, trichina in our pork, cotton oil and lard in our butter, cholera in our melons, burned peas in our coffee, Prussian blue in our tea, it becomes a puzzle as to what to live on. But it is almost as perplexing to know what to wear. The flashy aniline dyed undergarments now fashionable are liable to dangerously poison any little scratch or abrasion of the skin; and now comes Mr. Joseph F. Geisler, official chemist to the New York Mercantile Exchange, with an interesting article in the current number of the *American Grocer* on poison found in the sweatband of hats, and suggesting investigation by medical authorities and the Board of Health. He has found the poisonous matter in his own hat, where a formation of sulphide of lead, used for coloration, appeared when the hat was accidentally exposed to an atmosphere containing sulphurated hydrogen. A careful analysis of the sweatband showed it to contain no less than .0566 grammes (.8585 grains) of lead per square inch, or 2.446 grammes (37.548 grains) for the entire sweatband. If you have headache or pimples on your face in the summer-time, perhaps "that's what's the matter."

MEDICAL ETHICS.—The criticisms passed on medical advertising by some members of the profession are, to say the least, exceedingly absurd. Why should not any one possessing special ability pursue a course of this kind so long as he does it in a perfectly honorable way? Why should light be placed under a bushel, or talent be hid in a napkin? Is it not just and right that those who are suffering the pangs of disease should know that there are those who can give them relief? Why should they be in the depths of misery and woe for lack of knowing where to apply? Are not the wants of suffering humanity of vastly more importance than a code of so-called ethics, created in the dark ages and still nursed by doctors who believe that their own success depends upon shrouding the practice of medicine in mystery? There is a democracy of learning and of taste nowadays as well as of politics; hence the time has now come when the old code of medical ethics, in this respect at least, should be abolished, and let the sick, far and near, know where their misery can be lightened, their happiness restored. Those who lack the ability to heal will go to the wall—"the fittest will surely survive."

A TEST FOR MALARIA.—A loving father who, at a summer resort last season, had left behind him four beautiful children, dead of diphtheria, said to me: "That hotel proprietor was as much a murderer as if he had shot my little ones." Yes, dear sir, but you, the guardian, ought to have been armed and equipped against such foes. An hour's intelligent examination of water supply and drainage at a proposed country home would in a large majority of cases prevent the risk of such catastrophe, and might be made before a landlord could object. Take in

the dressing-bag an ounce vial of saturated solution of permanganate of potash, which any druggist will prepare for a few cents, and put half a dozen drops into a tumbler of the drinking-water that is supplied. If it turns brown in an hour, it is, broadly speaking, unfit to drink; if not, it is not especially harmful. If a country hotel sewage system is confined to cess-pools within a hundred feet of the house, and near the water supply, take next train to a point farther on. These matters should force themselves on one's personal attention, quite as much as the undertaker's bills that occasionally follow their neglect.—*American Magazine*.

DOMESTIC ECONOMY.

CREAM PUFFS.—One cup hot water, one-half cup butter, boil together; while boiling stir in one cup sifted flour, remove from fire and stir to a smooth paste; when cool, add three unbeaten eggs, stirring five minutes. Drop in spoonfuls on buttered tins and bake in quick oven 25 minutes. For cream, take one cup milk, one-half cup sugar, one egg, three tablespoonfuls flour; cook thoroughly and flavor. When cream and puffs are cold, cut open puffs with sharp knife and fill with cream.

BROWN THICKENING FOR SOUP.—This is easily prepared, is always ready, and will keep a long time, beside which it gives a far richer flavor than any other way of using flour thickening. Put into a small saucepan half a pound of butter; when hot, stir into it half a pound of very dry flour; stir this over the fire till a pale brown, taking great care it does not burn. One large tablespoonful thickens a quart of soup.

RAISED DOUGHNUTS.—In the morning take one pint of warm milk, one cup of sugar, one-half cup of yeast, a little salt, and set a sponge, making it rather thick. At night, add one cup of sugar, one-half cup of lard and two eggs; knead up and let stand until morning. Then roll out thin, cut round and let stand on the molding-board till light. Fry in hot lard.

DRESSED TONGUE.—Take a corned tongue and boil tender; split it, stick in a few cloves, cut one onion, a little thyme, add some browned flour. Have the tongue covered with water, in which mix the ingredients; add three hard-boiled eggs chopped fine, and send to the table garnished with half-boiled eggs.

SALMON SALAD.—To a can of salmon take eight or ten stalks of celery; cut the celery into small pieces and mix with the salmon, which should also be picked into small bits; sprinkle over a little salt and a very little pepper and pour on some good vinegar. A small onion may be added if desired.

APPLE JELLY.—Use fair, sour apples. Slice them, skins, seeds and all, and simmer with one-half a cup of water, till well cooked and soft. Then strain through a cloth, add a pound of sugar to a pint of juice, boil a few moments, skimming till clear; then pour into glasses, and cover when cold.

SILVER CAKE.—One-half cupful of butter, one cupful of sugar, one-half cupful of sweet milk with whites of four eggs, 1½ cupfuls of flour, one teaspoonful of baking powder. Always beat the eggs separately and thoroughly and always rub sugar and butter to a cream.

COFFEE CAKE.—One cup sugar, one cup melted butter, one cup New Orleans molasses, one cup strong coffee, one egg, one teaspoonful baking powder, one teaspoonful ground cloves, one tablespoonful ground cinnamon, one-half pound each of raisins and currants, four cups sifted flour.

MOLASSES COOKIES.—One cup butter, two cups molasses, one teaspoonful cloves, one tablespoonful ginger, sufficient flour to make a stiff batter, not dough. Mold with the hands into small cakes, and bake in a steady rather than quick oven, as they are apt to burn.

COOKIES.—Two eggs, 1½ teacupfuls of sugar, one cupful of butter, one-half cupful sweet milk, two teaspoonfuls cream of tartar, one teaspoonful of soda, nutmeg to taste. Mix in enough flour to roll, cut into round cakes and bake in a quick oven.

WASHINGTON CAKE.—One pound of brown sugar, one pound of flour, one-half pound of butter, two pounds of stoned raisins, four eggs, two teaspoonfuls soda, dissolved in half-cup of hot water, one-half pint of molasses, two grated nutmegs.

BROWN BREAD.—Two-thirds of a cup of molasses, two cups sour milk, one cup sweet milk, two teaspoonfuls soda, one of salt, one cup flour, four cups cornmeal. Steam three hours and brown a few minutes in the oven.

DELICATE PIE.—Whites two eggs, four tablespoonfuls cream, one large spoonful flour, one cup white sugar, one cup cold water; flavor with lemon. Line a pie-plate with pastry, pour in the mixture and bake at once.

LEMON MARMALADE.—Take lemons, peel and extract the seed. Boil the lemons until soft, add the juice and pulp with a pound of sugar to a pound of lemon. Boil to thicken.

GRAHAM PUDDING.—Two cups of graham flour, one cup of molasses, one cup sweet milk, one cup of chopped raisins, two teaspoonfuls soda. Steam three hours.

SPONGE CAKE.—One cup of sugar and three eggs, beat well, add one cup of flour and one teaspoonful of baking powder; mix well and bake.

The Week.

The voice of the boom is still heard in the land. Its sound is each day penetrating to more distant parts. There are features of the movement which one is quite apt to call unhealthy and fraught with evil rather than good to the interests of the State. So far as one is led to investment with no thought but to sell again, and with no reckoning of the intrinsic merit of the area secured, either for situation, environment or productive capacity, the action partakes more of the nature of gambling, and as such is not lastingly beneficial either to the individual or the community. But it is hard to tell where legitimate speculation ends and gambling begins. So far as a general increase in values of California real estate is concerned we think it is warranted by the percentage which well managed productive areas are now yielding their owners. From this general increase naturally will come special advances for eligible sites in or near towns, either for business or for homes, for it is plain that there is to be an incoming throng for settlement here far greater than we have yet known. This multitude of home-seekers will be destined in part to occupy and develop bare land in localities in which improvement has so far proved profitable. Hence we can see a very good reason for advance in the values both of country and town property and we are disposed to regard brisk move-

ment, at advances which do not seem excessive, as a healthy movement. We believe such increment is likely to endure and to produce permanent results. In many localities in this State values have been stationary for a decade, while in others there has been most wonderful advance. It is to be expected that ere long something like an equilibrium will be restored, and we are not disposed to croak at the boom. There will be cases in which people will get wild and illustrate anew the proverb about fools and their money; but such a parting would come in one way if not in another. Between a boom and a "deal" in stocks, the former is far the lesser evil.

Unparalleled Activity in Fruit.

The boom in real estate finds a counterpart in the activity in the fruit industry. Eastern shipments have proceeded with first three full trains a week, then five trains, with the regular passenger also overburdened with fruit cars. This week the movement has been a full fruit train every day. Though this outlet conveys a large amount of fruit, it is evident that it is hardly missed from the grand supplies of some fruits. We are beginning to feel the full effects of the great plantings of three and four years ago, and it seems that two trains a day are quite as necessary as was one train a day a short time ago. Pears, peaches and grapes are the main staples of shipment at present. Plums are the popular fruit at the East, and the disposition among planters this year will be an extension of the plum area. Of course this year's plum crop is short, which makes this feature of the Eastern demand the more marked.

The next line of activity which is disposing of the fruit is the canning business. Here, too, the capacity of the canneries and the labor supply are altogether unable to cope with the amount of fruit and the demand for it. Quite in contrast with the cautious operation of the canners two years ago, is the present condition which finds them obliged to refuse orders which pour in upon them in unexpected and unprecedented amount. All the canneries are running to the last can they can handle, and yet it is easy to see that California cannot put out enough this year to meet the demand. This demand comes mainly from the States east of the Mississippi, and the effect has been to raise the price of canned peaches about \$1 per case, and apricots half as much. The movement to Great Britain by ship is also very large, some estimating that this year's outgo by ships will reach something like 200,000 cases. This realizes much that has been anticipated for the last few years, and has been embodied in the phrase "the world for a market." We see already that the world is larger than we had counted, and already we are not able to satisfy it. It is plain that our canneries must be multiplied before another fruit harvest ripens. Several places which agitated the establishment of canneries this year and then let the projects fall through, can now clearly see that they let slip the chance to make considerable money, and distribute much more among the fruit-growers of their districts. Probably the lesson will be better learned for next year and the building and equipment of canneries will be begun early. These enterprises are, of course, limited by the available labor supply. The canneries of this city would have employed thousands more women and girls if they could have found them. The streets were patrolled by wagons with great signs, "1000 women wanted to cut fruit," etc., and yet the canneries could not secure the help they needed. Thousands of dollars were lost day after day because the fruit could not be handled. It will be urged that canneries should not be built when the labor supply is inadequate. We believe this question will regulate itself and that the labor supply will grow with the demand, but the canneries should be located so as to secure the help of women and children in the smaller towns and cities. It is ridiculous to haul all the fruit to great centers to have it canned. The outside canneries have done excellently this year, and, though pressed somewhat for help, they have secured a better supply in proportion to their needs than the city canneries have. Let every town with an orchard environment build and equip its cannery. Let the public schools delay their opening until the fruit is cared for. If this be done, the canned fruit product can be multiplied without much addition to the labor supply which is now

available if the enterprises are located so as to reach it.

But there is another line of activity, and that is found especially in and around the orchards. It is the recourse to drying. If the demand for dried apricots and peaches had not shown great proportions this season, the ground under the trees would now be carpeted with neglected fruit. The city trade would not pay the freight on it, the shipping could not make any impression on its volume, and the canners, as just noted, reached limits before a fraction of the fruit had been picked. Buyers came early for dried fruit and offered good prices. Some growers did not plan to dry until they had made good contracts for the product; others had confidence in the general situation, and every being large enough to handle a knife was pressed in to cut fruit. Relatives and friends on visits have caught the prevailing fever and have been slashing away at profitable prices. Families have come into the fruit regions to camp, while all hands and the cook have gone to work at the fruit. Thus, there has been amassed a large labor supply for fruit-drying, and as the lesson has been but barely learned this year, much greater things may be expected next year. Much has been learned, too, in methods of handling fruit for drying, and this will be brought forward in our columns from time to time. It is plain that we must have the multiplication of the most capacious artificial driers or evaporators. Capacity must be the object sought for by inventors and builders. Beyond these there must be the fullest use of sun heat, especially in those parts of the State not invaded by fog and dew. We have seen sun-dried apricots and peaches from such localities this year which were quite as good as any evaporated fruit could be. Such fruit has been spread out literally by the acre on individual orchards.

And yet in spite of the immensity of our output of dried fruits this year, it looks as though we should fall as far short of filling the demand as we are in the matter of canned fruit. Really the long-propheesied day of great things in California fruit is at hand. The question now seems to be not "what shall we do with it?" but "how can we get it ready?" This is the better and more hopeful question.

The World's Cattle.

Perhaps the most magnificent government publication on a special agricultural subject which has ever issued, is that we have just received from the Department of State at Washington. It is one of the series of Consular reports, and is entitled "Cattle and Dairy Farming." It is a large octavo of 855 pages, and includes 369 illustrations of the prevailing types of cattle in the various countries of the world and some other matters relating thereto, together with the latest foreign devices for cream separation and milk testing. This publication is the result of a request made of the Department of State by a number of leading live-stock men that the consular representatives of the Government be requested to inquire into the live-stock interests of the world, and that their replies be published for the instruction of those in the same line of industry in this country. The bulk of the weighty document is incapable of condensation or abstract, but the document itself should be issued as widely as possible to our live-stock men, for they can gain much valuable and suggestive information from it. These matters are the description of local breeds and methods of care and feeding, and other such details. One direction of inquiry was to what extent the live-stock products of this country could be exported to the various countries of the world, and in what form they would best suit the consuming population. Of this portion of the reports, Secretary Bayard, in his introductory letter, gives something of an outline. It is shown that as with our wheat so with our live-stock products, we must look to the United Kingdom for our chief market. To this same direction the meat and dairy producers of all the world seem to be bending their productive energies, for the Secretary shows that aside from our shipment of oleomargarine to Holland and a small amount of cured meats and dairy goods to Canada and the West Indies, our trade in cattle products is with the United Kingdom. The statistics given are for the year 1884; but these, so far as

shipments from this country are concerned, are not so late as we obtained last year from the Bureau of Statistics and gave in the *RURAL PRESS* of June 19, 1886. The total shipment of meat and meat products for the year ending at that date reached a value of \$85,000,000.

The report before us, however, gives an interesting table showing how the United States compares with other countries in contributing to the fresh-beef supply of Great Britain. It is as follows:

Whence Imported.	Quantity, Lbs.	Value.	Per Lb., Cts.
United States.....	90,904,128	\$10,724,579	11.8
Russia.....	3,551,184	352,107	9.9
Canada.....	2,643,872	320,531	12.1
Germany.....	711,648	89,409	12.5
Australia.....	308,448	32,843	10.6
France.....	104,272	17,593	16.8
Other Countries...	151,648	16,018	10.5
Total.....	98,375,200	11,553,080	11.7

This table shows that the United States in 1884 sent to Great Britain more than nine-tenths of the meat which she received from outside sources. Of course since then there has been an increase in the amounts contributed from some other countries, for we showed in the *RURAL* of August 21st that in 1885 the colonies sent a vast amount of meat, and South America also figured largely in the supply. Of course, as this trade is developing fast, a year's age in statistics makes a great difference.

The report contains a vast amount of information to which we shall take occasion to refer hereafter. Meantime we would advise our cattle-growing readers to ask the Congressman of their district to secure copies for them. As the document is so large, probably the edition was small and early applicants will be most fortunate.

The Locomotive at Santa Barbara.

The day for which Santa Barbara sitting by the sunlit sea has long been patiently waiting, has come at last. The new railway from Newhall northward along the coast was formally opened to Santa Barbara on Aug. 20th, by a jubilee celebration, which was most expressive in its enthusiasm, and most important as marking a new era in the history of the town. The scenes at the jubilee are described as beyond anything ever experienced. Throngs of people came from Ventura, Los Angeles, San Diego and San Francisco, and the city put on a holiday aspect, the buildings being all gaily decorated, the streets bright with flags and streamers and crowded with well-dressed people. The program of the occasion comprised a parade through the principal streets, speeches at Barton Mound, near the seashore, by distinguished citizens and visitors, and a grand lunch prepared and dispensed by the hospitable ladies of Santa Barbara.

The parade was the most notable outdoor feature of the occasion. There were in line the military, fire department, social and fraternal organizations, gaily dressed school children, Spanish cavalcade, trade displays and fruit and farm products. One hundred carriages were in line, with distinguished guests. Other parts of the parade were formed by the Mexican Veterans and picturesque cavalcade of well-mounted young men, several of whom were dressed in the full and gorgeous attire of a Mexican cavalier, from the sombrero, heavy with gold lace, to the gold-mounted sword and spurs of the same gorgeous description.

The leading spectacular feature was a representation of the advance of transportation that has occurred in Santa Barbara. First came an old-time Barbareno leading a pack-mule, followed by two others loaded as in former days with barrels and packages strapped on. A stage-coach of the "sixties" followed, and then came an immense picture of an express train of the present day. The exercises of the day concluded with a grand banquet at the Arlington in the evening.

These incidents mark the present exultation of the residents of Santa Barbara over their union with the railway system of the State. The after effects will be more quiet but not less marked in the progress and prosperity of the town. Santa Barbara will find her visitors multiplied, her values increased, her productions increased as the outlet for them is improved, and she will still retain the advantage of her water transportation, which will be a decided advantage in many ways. We congratulate our readers in Santa Barbara and vicinity upon the advancement of their affairs.

Fruit Notes in Vaca and Pleasant Valleys.

[Editorial Correspondence.]

We had the pleasure of a run through these famous valleys last week, just as the peach crop was at its height and the whole productive area was a scene of the most intense activity. We call our visit merely "a run through the valley," for our time was too limited to see all our friends or to closely examine the possessions of those whom we did see. We expect to take occasion for another visit soon. We also have a lot of interesting notes of a personal and historical character which we hope to have opportunity to weave into a sketch of this famous fruit district. At this time we shall write merely in a general way of what we saw, with an idea of noting some features of the country, showing something of the extent of the industry of the district, and above all the practical methods which are now being employed, for we conceive a dissemination of this information of the greatest immediate importance.

During our first night in the valley we were hospitably entertained by Mr. and Mrs. W. W. Smith, at their elegant residence, about two and one-half miles up the valley from Vacaville. The early morning found us out among the throngs of workers who were picking fruit for Eastern shipment. About 1000 packages of peaches and grapes went off the ranch during the day. At the same time the peach-cutters were busy and were quickly covering the drying floor—a piece of ground of about two acres sloping toward the sun, having been carefully cleaned of dead grass and dust. It was hard and clean, at the base of a steep hillside and a long distance from the main roads, and was well situated to get all the sun-heat and to escape the dust. It constituted a solar drier of vast proportions. As we saw it, it was of variegated hues, as the peaches spread were both of white and yellow sorts. Those who beheld it when the ground was densely covered with apricots describe it as a sheet of gold. The examination of Mr. Smith's trees gave us much pleasure. The fine growth, uniformity of training and abundant fruitage are most unmistakable testimony to the skill of the grower and the natural adaptation of the region to fruit.

After leaving Mr. Smith's our next stop was at the drier of Frank H. Buck, almost embowered among the peach trees, whose fruit was being evaporated as fast as the machinery could handle them. Mr. Buck has a drier of the Blowers design, but not with all the Blowers arrangements for distributing the heat. The building inclosing the drier is 16x36 feet with the brick furnace bisecting it, and on two sides of this furnace are five chambers or sections, each holding two tiers or trays. On the top of the building is an exhaust fan, which is found of great value, hastening the drying, and thus increasing the capacity of the drier. The fan is run by a portable engine situated outside the building. Near the drier Mr. Buck has a good building 36x44 feet, two stories. The lower floor is used for packing and cutting, and the upper floor for box-nailing, packing of dried fruit, etc. Around the buildings are broad verandas which add much to the sheltered working space. Mr. Buck finds he must utilize the sun as well as the drier to use up the vast amount of fruit which he has ripening. He has been handling an average of 20 tons a day of green fruit during the last six weeks. He is employing from 80 to 85 hands, and his busy season with different fruits will extend from June 15th to October 1st. The orchard area under his ownership and charge together, comprises 250 acres. It reaches across the floor of the valley from side to side and up and down the valley rather more than a mile.

Proceeding northward, we stopped a few moments at the ranch of L. L. Hatch, a pretty place notable to the visitor because of the age of some of the trees which are said to have been planted as early as 1855. One is a veteran Moorpark apricot, which has furnished many buds for the multiplication of its kind in the valley. The old tree shows its age, but is still productive, for Mr. Hatch told us that it had recently produced 25 boxes in a single year. We also stopped a moment at the place of W. H. Price, who was up to his eyes in work and seemed to be doing it very well. We made quite a stop at the Pioneer ranch, which was

early improved by M. R. Miller, and was purchased by the late G. M. Blake, who gave the place a most elegant outfit of buildings and other improvements. It is now owned by Mrs. G. M. Blake, whose policy is evidently still further development of the property, which is being done on a generous scale under the able supervision of Mr. T. M. Thomson, a pioneer horticulturist, whose work at the Suscol orchard and nurseries in the fifties will give him an enduring place in the history of California fruit-growing. Mrs. Blake's property comprises 320 acres, of which 140 acres is now in fruit and its area being rapidly extended. The property is one of the finest country-seats we know of.

Our next stop was at a hospitable home whose owner does not crave the fame which the itinerant scribe has to bestow, and he can safely decline it, for his place in the community is fixed by his sterling character, and his skill as a horticulturist is proclaimed by all his trees. If we had not promised not to do it, we should tell about a chestnut grafted on a live-oak five or six years ago, and which has grown to a height of ten feet from the graft, bearing plenty of burs which seldom fill; or a magnificent grove of figs planted 25 years ago, covering a stretch of ground 600 feet long and perhaps one-third as wide, the trees in some cases 80 feet high, the foliage completely covering the ground—a perfect canopy of green; of acre on acre of most symmetrical and uniform peach trees; of a young Winter Nelis pear orchard, brought into complete subjection by being al-

lowed to grow and are folding over down its western slope. Time would not permit us to visit all the places named, but we admired them from afar.

We took a ride with Mr. Thissell over a part of the new road from Pleasant Valley to Winters, going as far as the ranch of S. C. Wolfskill, for a visit to the old olive, date and fig plantations, made by J. R. Wolfskill and S. C. Wolfkill in the early days. The new road fills a long-felt want and enables the Pleasant Valley growers to reach their shipping point at Winters easily, and gives them entrance and egress during the rainy season, which was often interrupted over the old road. The road follows for a distance along the base of the hills on the eastern edge of the valley and the south shore of Putah creek and thence across the splendid uplands of the Wolfskill property. Where the road skirts the hills it gives a fine view of the rich ranches of the Putah region, beginning with the places of Seaman and Sackett, at the mouth of Putah canyon, and thence eastward the eye falls upon the grand farm of Professor W. T. Reid, while farther east are the places of V. Slade, Sackett & Allison, and Devilbiss, thus nearing the townsite of Winters, which unfortunately we had not time to visit. The new road seems to us a great acquisition to the whole section of the country, and will minister much to develop all the property on the south side of Putah creek.

Handling the Peach Crop.
Before retracing our way through Pleasant

THE CLYMAN PLUM—A NEW EARLY VARIETY.—See next page.

lowed to sow its wild oats in the shape of straggling branches, and then licked into good form by the pruner's knife; of the many picturesque beauties of the place, its vine-clad oaks, rose-bowered arbors, its oak-studded hillsides and orchards on natural terraces—heaven forgive us for promising not to mention any of these things!

The shades of night were gathering fast as we drove rapidly through the picturesque glen which forms the eastern arm of Pleasant valley, and it was dark when we alighted at the home of G. W. Thissell, well known by name at least to many readers of the RURAL. In the passage to Mr. Thissell's we sped by several excellent places which will be noted on our return southward. We were given a cordial welcome, and soon after daylight the next morning were clambering up among the orchards lying on the eastern side of the central ridge which runs north and south through the lower lands of Pleasant valley. This ridge is much lower than the mountains which form the eastern and western rims of the valley, and yet high enough to catch the earliest sun-heat, and thus enables Winters to claim the earliest peaches and apricots as belonging to its parish. It is indeed a warm and rich stretch of hillside, with Mr. Hinckley's sky-high orchard at its central highest point, and extending thence southward through the lands of the Thissells and Brincks and northward through the possessions of Messrs. Tucker and Sackett until it flattens out into the rich level lands of the Putah Creek region. Orchards flank this ridge on the east,

and Vaca valleys toward Vacaville, we digress to make room for some notes on the peach crop and the disposition which is being made of it. Almost the whole population of the valleys was engaged, in some capacity or other, in handling the peach crop. The yield of the trees was fairly immense this year, and the heavy fruitage of three and four-year-old trees, just coming to bearing, has multiplied all records heretofore made in the valley with the peach. If there had been any decent price for ripe peaches, the people would not have had opportunity to demonstrate their working capacity as they have this year. Drying was, however, the only way open for the profitable disposition of the crop, and fortunately the market opened this avenue, and while we were there dried-fruit buyers were thick, and 18 cents per pound for peeled peaches, both sun-dried and evaporated, was an ordinary price. So well do the sunlight and the dewless nights act upon the fruit that the sun-dried fruit is of the very highest character, and the warm ground on the slopes, or between the tree rows, is turning out hundreds of tons of dried peaches, which even a buyer can find no fault with.

The methods of peeling peaches this year show new and interesting points: The two methods in sharp contrast are machine peeling and lye peeling—the latter immensely preponderating. Opportunity is given for contrasting the two methods at the ranches of G. W. Thissell and W. J. Pleasants, both in Pleasant valley. Mr. Thissell relies wholly upon machine peeling, using the Scott machine with which his best peelers

peel 80 baskets a day, and one cutter handles as many as one peeler; thus two men prepare 80 baskets—peeling, pitting, and spreading on trays in a day. There are many ways of using the lye treatment, the minutiae of all of which we have not space to present. The material which prevails is the "Greenbank 98% caustic soda." Mr. Pleasants has just outside his cutting-house two farm kettles bricked in over one fire. A few feet from these under the roof are two vats, made like wooden horse-troughs, about 3 by 8 feet, standing near each other, and each supplied with water by a faucet. One man works each kettle, exposing the fruit to the lye, which is nearly boiling hot for about a minute, turning the perforated pail in which a basketful of fruit is placed, so that the peaches move about in the lye. Each then empties his dipping pail into a galvanized-iron pail perforated with half-inch holes which stands ready in the first vat of water. The man at this vat stirs the fruit around in the pail with a thick, round stick, rubbing the peaches against each other, and the lye-blackened skin disappears and shows the clear yellow of the peach. The pailful of fruit is then dumped into a second similar pail by which it is carried to the second vat and there ducked up and down in the water to rinse away the surplus lye, and then it is emptied into galvanized tubs about two feet in diameter filled with water. Around these tubs the cutters sit, taking the fruit from the water one by one as they cut. This process seems to give the fruit a most thorough rinsing, saves it from contact with the air and removes the slippery feeling which the lye gives the peach if not thoroughly washed. Mr. Pleasants' water supply is furnished from a tank filled by horsepower, and he seemed to have more water at command than any place we visited. The lye treatment evidently should be accompanied with plenty of water for refilling the rinsing vats, which soon become foul with lye and refuse. Complete rinsing and freedom from contact with the air, which is gained by keeping them in water till cut, helps to preserve the bright yellow of the peach. At Mr. Pleasants' place 35 hands, many of them boys, peeled, cut, spread and placed on the drying ground 20,240 pounds of green peaches in one day. Both Thissell and Pleasants use large trays 4 by 4 feet made of slats 3/4-inch thick and 1 1/2 inches wide, set close together, in preference to the 2 by 3-foot trays which are used by many parties. We have cited the two methods of peeling by Thissell and Pleasants as representatives. Others are doing much the same, and some are using both lye and machines.

J. A. Webster, who has an Acme steam drier, which he is working to his satisfaction, dips from boiling lye into boiling water, and thence into the cold-water vat. It is hard to get at the strength of the lye used, as the strength seems to vary, and more lye or more water is added according to the effect on the peach, which is tested by the dipper, who scrapes the surface of the peach with a small stick which he keeps handy for the purpose. It was common to start with lye, about one pound to the gallon of water, but since using the Greenbank alkali, some are starting the dip with one-half pound to the gallon.

In pitting clings there is also much diversity of method, or rather in the knife used. At John B. Carey's place we saw the spoon-shaped pitter being used with satisfaction; at J. W. Gates' and Henry Bassford's and elsewhere, the Tarlton knife, with its semi-circular blade fastened upon the cutting edge of the straight blade, was relied upon. There is also said to be a knife with a bow in the blade itself, being used with satisfaction. Different operators acquire great facility in the use of the different styles of knives. This is shown in the fact that the same price is paid for pitting clings as frees. Mr. Gates believes clings are the quicker handled. He has two men who spitted and pitted in one day 1500 pounds of clings culled out from fruit he delivers to the cannery.

The usual rate for pitting and splitting peeled peaches is 30 cents per hundred pounds and 25 cents for unpeeled peaches. One of the girls at Henry Bassford's place pitted and trayed 1150 pounds of peaches in a day; part

free, part clings. The girls are the best pitters in the valley, according to existing statistics.

Nectarines.

There are some most beautiful dried nectarines being prepared this year. At John B. Carey's we saw a bin holding about 3½ to 4 tons (estimated) of most beautiful, light amber-colored, translucent fruit. Henry Bassford has also produced a good many fine nectarines, believing a seedling originated by W. W. Smith to be the best drying nectarine he has.

Sulphuring.

So far as our observation goes, all are sulphuring the fruit—some more, some less. Nearly all use boxes which hold two tiers of trays, with a partition, so that one tier is sulphuring while the other is being filled. Nearly all have slots in which the trays slide like drawers in a bureau, but Henry Brinck had a new box with the cleats omitted, trusting to standing the trays upon each other. Several parties who are lye-peeling sulphur twice—first, before pitting or as soon as the peach comes from the rinse-vat, and then sulphur again after the fruit is on the trays.

More Anon.

At another time we will mention other directions of our wanderings and other places both in Pleasant and Vaca valleys which we visited. The subject is a fruitful one.

The Fair at San Jose.

The twentieth annual fair of the Santa Clara Valley Agricultural Society opened Monday, August 15th, under prosperous skies, and lasted through the week. The preparatory work had been well done by the officers of the Association, the grounds were in fine order, the weather was pleasant and the visitors many.

The live-stock entries in their number and variety surpassed those of any fair before given by this society. Applications far outran accommodations; so that the directors were forced to limit exhibitors to 15 stalls each—instead of allowing one party to fill 25 or 30, as in previous years. But this restriction tended to increase the variety and enhance the quality of stock entered. Among the cattle, Durhams, Herefords, Holsteins and Jerseys predominated, though there were a few Galloways, Devons and Ayrshires.

Col. Younger filled his entire space with the choicest of his famous Shorthorns, and took the sweepstakes for best bull of any breed, best cow of any breed, best herd for beef purposes and best herd of any breed.

P. Reardon also had 15 stalls of Durhams of different ages.

C. B. Polhemus had beautiful Jerseys—bulls, cows and calves—a handsome Holstein bull and some fine graded animals. J. S. Briggs exhibited a Jersey bull and cows.

S. W. Hanks' fat cow weighed 1900 pounds, and H. Abels' fat steer, "Duke of Milpitas," standing about five feet five inches, weighed 2800 pounds.

Frank H. Burke showed 11 stalls of thoroughbred Holsteins, some imported from Holland, but most of them raised at Menlo Park, which were adjudged the "best herd for dairy purposes." One fine bull tipped the scales at 2100 pounds.

Tyler Beach's 13 thoroughbred Ayrshires were admired for their elegant proportions.

Martin Carter's bull "D-fiance," cow and calf, were noble representatives of the Herefords. Wm. Quinn exhibited a few premium animals, Ayrshire and Shorthorn, and J. C. Martin showed fine graded cattle.

The display of horses, though not so numerous as the cattle, was praised highly. It included thoroughbred Normans and Clydesdales, and other draft animals, roadsters and horses of all work, while the stables on the ground held some of the finest racers in California. There were a large number of colts from Boyd's Grosvenor, all showing fine build and good trotting qualities. Mr. Boyd offered a special premium of \$75 for exhibits of the gets of his horse. The premiums on equine exhibits were as follows:

Best thoroughbred Norman mare, four years old, N. B. Edwards; stallion, one year old, same; stallion, four years old, Monte Carrol; same, one year old, Simon Mathews; four-year-old mare, C. C. Valpey.

Best Clydesdale mare, one year old, N. B. Edwards; best sucking colt, same breed, George P. Bull.

Best graded draft stallion, four years old, C. C. Valpey; same, three years old, Samuel Goldspring; same, two years old, George P. Bull; best graded draft mare, four years old, T. H. Burke.

Horses of all work—Best four-year-old mare, Ed. Younger; colt, J. R. Paul; stallion, four years old, T. W. Barstow; stallion, three years old, Thos. Massy; mare, three years old, Ed. Bonger.

Best matched span of horses, Joseph Kohlbecker of San Jose.

Best roadsters—Gelding, four years old, D. J. Porter; stallion, same age, E. S. Smith; mare, three years old, James P. Sargent; mare, two years old, Fred. M. Stern; stallion, three years old, D. W. Barstow; one-year-old stallion, E. Topham; two-year-old stallion, James Weatherhead; mare, four years old, Thomas Kennedy.

Special premiums for gets of Boyd's Grosvenor—

Best two year old, P. Malansen of Pioneer; one year old, P. C. Wattenlaugh of Livermore; sucking colt, E. Topham of Milpitas.

For best dam with three of her colts, E. Topham.

C. P. Bailey's pen of Angora goats were admired for the length and fineness of their fleeces. Edward Younger showed two pens of first-class Cotswold sheep, and H. C. Agnew had three pens of excellent merinos.

Among the swine, W. B. Rogers' Chester White pigs were remarkable for their uncommon size; Andrew Smith showed fine Berkshire hogs, and Tyler Beach, Essex and Berkshire.

E. H. Freeman, importer and breeder of poultry, made an admirable display of 20 coops, embracing Plymouth Rocks, Wyandottes, Brown and White Leghorns, Buff Laced Polish, Black-breasted Games, Partridge Cochins, Langshans and Light Brahmas. He told a representative of the PRESS that the interest in standard breeds of fowls is by no means waning, but rather on the increase. He had made some sales to the islands within the year. David Parker showed one coop of Langshan chicks, one of Light Brahmas and two of Buff Cochins—all large and handsome.

In the machinery department, John Christian's adjustable cultivators, an improved grape-stemmer and wine-press, and a number of Eastern and California-made vehicles attracted notice.

In spite of the real-estate furor in San Jose the races were largely attended, the greatest crowd having assembled on Thursday, when the lookers-on are said to have numbered fully 10,000, and Secretary Bragg remarked: "It's the biggest day we ever had." But the fact that two noble horses were driven to death upon the track—one by order of his owner, notwithstanding the counsel of his driver—to feed the crazy craving for excitement and gain on the part of "sports" and spectators, hardly increases the respect and esteem in which the "agricultural horse-trot" is already held by the humane and thoughtful.

In Horticultural Hall.

The trusses and rafters were nearly hidden by palm branches and other leafy adornments, in pleasing contrast with the light blue ceiling. The object most conspicuous on entering was a pyramid of potted plants surmounted by a large Japanese fan-palm. On the lower shelves were dwarf fan-palm, sage palm, dwarf bamboo, sequoia gigantea, banana, Japanese cut-leaf maple and other rarities. Beyond appeared the stage with a background of palm-leaves trimmed with ivy. Encircling the stage was a brilliant border of marigolds and roses, while on the sides were placed pedestals of moss. Amid this wealth of color there stood forth clearly a Maltese cross, and just beneath it an anchor. The meaning of these emblems, formed of flowers grown in the Garden City, was that the Santa Clara is the "star" of all valleys, and the proper haven in which the Easterner should "anchor." The center of the stage was devoted to an image of the goddess Pomona, made of different fruits and vegetables and framed in ivy, potatoes and apples. On the left of the hall was a rockery and waterfall, in imitation of some retired glen in the mountains. These and other decorations did great credit to the taste and diligence of the ladies to whom the work was intrusted.

Instead of the fan-shaped arrangement with single tables, which proved somewhat inconvenient last year, the tables were placed parallel to the walls and were of double width and length. Each section of the county had a space set apart for it. The first two tables on the right on entering the hall were assigned to Santa Clara and the Willows respectively. The next two to Campbells and Saratoga. Those on the left belonged to Berryessa, Mt. Pleasant and other places. In the center were the exhibits of Mrs. Watkins and John Rock. Most of the available space was taken by farmers and horticulturists, although several business houses had exhibits.

Among the innumerable displays we can notice only a few of the more striking and characteristic.

J. W. Bryan of Stevens Creek made a fine showing of egg plums, Hungarian prunes, Bartlett, Winter Nelis, Seckel and Easter Beurre pears, quinces, Newtown pippin and Jonathan apples, nectarines, almonds, Japanese persimmons, French prunes, Malvoise, Sweetwater, Grenache, Rose de Chasselas and Charbonneau grapes.

Batcher and Archibald of Santa Clara exhibited Columbia, Jefferson, Chabot (Japan) egg and Quackenbush plums, German, Gros, silver, French and Hungarian prunes, Bartlett, Howell, Sheldon, Easter Beurre, Keifer's Hybrid, Beurre Clairgeau and Winter Nelis pears and four varieties of fine seedling peaches.

Mrs. C. D. Horn of Santa Clara had a choice display of Washington, egg, Columbia, green-gage and Quackenbush plums, French and German prunes, blue figs and Foster peaches.

R. W. O. McLellan of Los Gatos showed Crawford peaches, Skinner seedling apples, Sweetwater grapes and six jars of choice preserved fruits of good size and variety.

A. Dennis of the Willows displayed Napoleon Bigarreau cherries picked August 15th.

R. E. Dent exhibited apricots, plums and prunes and Napoleon Bigarreau cherries. For the cherries off of 60 rods of land, Mr. Dent received \$690.53, being at the rate of \$1840 to the acre. He also received \$905.40 for the black Tartarian cherries taken from one acre.

Kelly Brothers showed Tokay, Vardal, Rose of Peru, Black Hamburg, and Muscat grapes,

Foster peaches, French prunes, Moorpark apricots, apricot peaches and a pyramid of plum and prune branches laden with fruit.

B. Campbell exhibited Quackenbush green-gage and egg plums, French prunes and Sweetwater grapes, Moorpark apricots, Snow peaches, Bartlett pears, California and English walnuts.

H. Campbell had a large variety of French and silver prunes, black walnuts, evaporated Moorpark apricots, and canned fruits in glass.

W. L. Morgan of the Willows showed Yellow Newtown pippin, Spitzenberg, Wine Sap, Yellow Bellflower, Winter Bellflower, Pearmain, Jonathan and Ben Davis apples.

L. D. Woodruff of the Curtner tract in the Willows exhibited mammoth Foster peaches, Moorpark apricots, Newtown pippins, Mary's Choice and Susquehanna peaches.

George L. McLaughlin of the same district had Susquehanna peaches, Hine's seedling apricot, a desirable variety of Crawford peaches, French prunes, almonds and Bellflower apples. Mrs. Aiken and Mrs. McBride showed Foster peaches, Hungarian and French prunes, Moorpark apricots, Washington plums, Gravenstein apples, Bartlett pears, and canned peaches and plums.

A number of persons brought samples of corn. One stalk, brought by J. W. Bryan, was 11½ feet high.

W. S. McMurtry of Los Gatos had a fine exhibit of oranges, some of them nearly four inches in diameter.

Mrs. W. J. Watkins made a very pretty display of her jellies.

We find ourselves obliged to refrain even from naming many of the meritorious exhibitors. The paintings by native artists, the addresses by C. M. Shortridge and M. H. Hyland, and other evening exercises, can barely be mentioned. And we must leave the Horticultural hall with all its wealth of foliage, flowers and fruit which so surprised and enchanted the throngs of Eastern visitors.

A New Early Plum.

The Clyman plum originated from a seed planted some 10 years ago, the tree having borne large and regular crops for the past five or six years.

Mr. Leonard Coates of Napa is propagating it, and introduces it for the first time this year. He has watched it for some time and recommends it as by far the best early shipping plum.

Mr. J. M. Bassford, Jr., of the early Vacaville belt thinks very highly of it, and says that there is more money in a good, early plum than anything else for the Eastern markets, and less risk in shipping.

The accompanying cut shows the exact size and shape of an average specimen. In color the "Clyman" is a mottled, reddish-purple, a freestone, and flesh firm and sweet. It therefore possesses in a marked degree the qualities essential to a good shipping fruit. Its chief value, however, is its earliness, ripening with the Cherry plum, which is a pretty fruit, but tender, juicy and insipid. The Clyman, as Mr. Bassford says, resembles an undersized "Peach" plum, but it ripens fully two weeks ahead of it.

THE VETERINARIAN.

Eye Disease in Stock.

EDITORS PRESS:—I notice in several papers from Nevada and elsewhere that a disease affecting the eyes of cattle is giving much trouble. In my practice I have also animals under my medical care that are suffering in the same way. The name of the ailment is "periodic ophthalmia," and is due to various causes.

Horses are generally predisposed to it; dark and unhealthy stables sometimes produce it, especially those buildings from which emanate ammoniacal gas from wine, etc. It occurs sometimes in one eye and then the other, and the inflammation causes the lids to swell, and in one case under my charge I am afraid that a scum is permanently forming over the eye ball (opacity of cornea). This inflammation and swelling will sometimes suddenly disappear and as unexpectedly return. Then again this disease occasionally occurs in animals at pasture, and when such is the case it is generally due to atmospheric and other causes. Casual observers have mistaken the periodic ophthalmia for that trouble caused in the eyes of cattle by insects, flies, etc. It does not affect them constitutionally, at any rate not very much; they do not fail in appetite. It is interesting to notice that when cattle are subject to this disease in the same vicinity and at the same time, people complain of an irritation in the eyes, and some of them attribute it to "something in the air." I see that a prominent dairyman says that nearly all the dairymen have the disease among their cows. This indicates that it is due to atmospheric causes. Some quick remedies are recommended, irritating an already irritated part, and adding fuel to fire. For instance, some men, in whom conceit exists, perhaps in excess of knowledge, advise the application of coarsely powdered glass, blown into the poor animal's eye!

Treatment.—If due to known causes, such as badly ventilated and dark stables, remove the cause. In most cases nature does not need

much assistance, sometimes none. In others it is necessary to bathe the eyes daily with warm water or milk and water, and subsequently applying soothing lotions. When the front part of the eye-ball (cornea) becomes opaque, it is necessary to apply a mild stimulant. But this should not be used until some time after the inflammation has disappeared and when it is evident that nature really needs assistance. In bad cases I find it necessary sometimes to tie the animal in such a way that he cannot rub the part against the stall. ROBERT J. DAWSON, 225 Geary St., S. F. Veterinary Surgeon.

THE VINEYARD.

Bleaching Sultana Raisins.

J. H. Wheeler, Chief Executive Viticultural Officer, has just issued a circular on the bleaching of Seedless Sultana raisins, which we give in full as follows:

The area planted to the Seedless Sultana grape in California was greatly augmented in 1881, 1882 and 1883, during which time it was in great favor with many. After 1884, the planting of this variety nearly ceased, and it is not at present a popular grape for either wine or raisins. The market is easily glutted with its raisins, and the wine has, with few exceptions, proved other than satisfactory. Prominent among other objections has been its tardiness in coming into bearing—generally this variety must have attained the age of at least five years before it sets a good crop. When once well in bearing, however, it is regular and very prolific—it has been known to produce as much as 15 tons per acre.

The extensive plantations of Sultanas made at first are now coming well into bearing, and the matter of preparing the raisins for market is one of considerable interest and inquiry.

Letters have come to me asking for full instructions as to the best methods of bleaching, drying and marketing the grapes.

The imported Sultana raisins come to our markets bleached; they are translucent and nearly colorless—more so than any I have yet seen prepared in California. These command better prices than the domestic Sultanas.

Bleaching and drying these raisins have been carried on here by a very few, and their experiments have been limited. Some good results have been obtained, and it is the experience which has grown out of these successes which I am here able to produce.

Mr. W. B. West of Stockton has been the early pioneer in the matter of Sultana raisins, having cultivated this grape for upward of 20 years. In drying them, he was first to employ bleaching, the details of which he had learned in Europe, and after a trial he communicated his experience to Messrs W. T. Coleman & Co., who have since furnished this, together with other information, to some of their customers.

Prominent among others who have prepared bleached Seedless Sultana raisins, are Jackson Bros., N. Wyckhoff and Wm. Forsyth.

I give, in the following directions for the work, the latest instructions produced by the commission-house of Wm. T. Coleman & Co., together with such changes and additions as have been suggested by Mr. W. B. West and Byron Jackson. These gentlemen have kindly assisted me in the matter:

Directions.

For the best results the grapes must not be picked until they are fully ripe. This is indicated in bunches not too much shaded, by the bright amber color of the skin, which, however, fails to appear in grapes hidden from the light and sun. A certain determination of full ripeness may be had by pressing the clear juice from the grapes thought to be ripe, on each of several successive days, at each pressing determining the sugar by means of a must scale, and when the amount of sugar shows no increase from day to day, the grapes are ripe. In making these tests, care must be taken that no bad bunches enter the samples, as whole bunches of Sultanas are sometimes found which never sweeten—these should be carefully excluded throughout the treatment.

More care is necessary in determining the perfect ripeness of the Sultana than is the case with the Muscats, as when at all green the large amount of acid so common to this variety renders them almost valueless. Even when drying, the bunches being large and dense, should be carefully examined to see that they are ripe throughout.

Before picking, everything should be in readiness for bleaching. The necessary preparations are as follows:

A kettle or kettles holding 20 gallons or more, proportioned to the amount of work to be performed, should be ready to heat up. The work of dipping the grapes into the lye solution may be done in the kettles if necessary, but for convenience it is best to have a wooden trough built at which a number of persons can work.

This trough should be provided with a sheet-iron bottom, and built over a brick fireplace, so that the heat of the solution may not be lowered by the dipping.

The lye solution used thus far in California has been made of concentrated lye dissolved in water just below the boiling point.

In Smyrna, however, the practice has been to use instead of concentrated lye, consisting in our market of impure and variable caustic soda, the potash lye obtained by leaching the

ashes produced by the burning grapevine brush. The superiority of the imported Sultanas would hence lead us to infer that potashes, which is the alkali obtained from ashes, or better still the pearlashes, which consists of purified potashes, could be substituted for concentrated lye to advantage. The last-named potash salt is dearer than any of the others, but the quantity consumed is so small that no hesitation should be had in substituting this clean and wholesome salt for the soda salt, so uncertain in composition and impure. Another advantage growing out of the use of pearlashes would be that of preserving the raisin in a soft, jelly-like condition, with a clear, glossy skin more inviting far than the dry, chip-like raisin sometimes produced by the over-drying of raisins dipped in caustic soda.

The proportions recommended and employed heretofore have been one pound of concentrated lye to five gallons of water. To make an equally caustic potash solution would require about 1½ pounds of pearlashes to five gallons of water. The price of pearlashes, which consists of pure carbonate of potash, varies from eight to ten cents per pound, according to quality.

Another indispensable provision is to secure facilities for rinsing the fruit in cold water immediately on its removal from the hot-lye solution. The best rinsing may be done in running water, but when this is not practicable, a barrel or tank may be used, care being taken to renew the water frequently, in order that it may not become so charged with the lye as to improperly perform the rinsing.

A dripping-rack may be had above the trough or tank, by placing cleats or strips across on which the trays may stand a few moments after removing from the bath. They should be well drained when removed from the rinsing water, otherwise a drop will form and dry up on the underside of the raisin, leaving a dark spot when cured.

To add to the soft, glossy appearance of the skin, a quantity of pure olive oil should be provided, which may be added to the dip on which it floats. The oil for this purpose should be pure. To insure purity, it is safest to use oil produced in California. Glycerine is highly recommended for the same purpose—some claim that it is superior to oil, and, being cheaper, may be used more freely.

The apparatus being in readiness and the grapes ripe, the lye should be put in solution and heated. The potashes being all dissolved, the oil or glycerine may be added at the rate of half a large spoonful now and then as it disappears on the grapes. If oil be used, the proper amount will give to the solution a distinct amber shade.

As little time as possible should elapse between the period of picking the grapes and that of dipping the same. A great deal depends on this, as any delay in getting the grapes into the lye will make the work more difficult and the result more uncertain.

Some recommend picking the grapes in baskets or buckets of perforated tin, in which, without transfer, they may be immersed in the dip. Mr. Jackson places the grapes on a tray made with a frame of iron which is covered with wire gauze with one-quarter inch mesh. The frame projects upward on the sides to prevent the fruit floating off when in the dip, and is made to receive, as a cover, the wooden tray on which the fruit goes to the drier. When dipped and rinsed, the wooden tray is placed over the dipping tray and two men transfer the fruit by turning over the two. This system, I believe, is superior to all others, and economizes time and labor in the curing.

The time which the grapes should continue in the dip will vary with the locality. In some districts they possess thick skins, thus requiring a longer submersion than when the skins are thin and delicate. From one to two minutes is the prescribed time—experience and observation are the best guides.

The dipping causes the skin of the grape to crack, at which time they are dipped enough and should be removed.

After dipping and a moment's draining over the trough, they should be rinsed thoroughly by immersing them in the pure water of the rinsing trough, after which drain well, long enough to allow all of the water to run off which will run off. After transferring as above, the drying may be conducted as for other raisins.

If the drying be conducted in the open air, and the heat of the climate will permit, the trays should be stacked immediately one above the other, up to a convenient height for handling. Sultanas dried thus in the shade will profit much more by the bleaching than if exposed to the direct rays of the sun. A building through which the draught draws strongly and warm is the best for open-air drying.

When the drying is complete the bunches should be gently rubbed over a sieve with fine meshes to remove the stems, which will then come off readily.

When thus finished the raisins should be packed in regular raisin-boxes, which, according to W. T. Coleman & Co.'s instructions, should contain just 25 pounds net weight. Use only one plain single paper wrapper around them all. Over the top face of the raisins, between them and the leaves of the paper wrapper, insert a piece of confectioner's wax paper; this done, your product is ready to enter the market in competition with those similarly prepared in Smyrna.

Besides adding to the appearance of the Sultanas raisin, this operation increases perceptibly

the weight of the finished product, greatly bettering it by the moisture-retaining power of the potash.

The process of bleaching, I am informed, adds 25 per cent to the selling price of the raisins. Messrs. W. T. Coleman & Co. put the profit a little lower than this. Such being the case, those drying Sultanas cannot afford to long avoid the simple addition of the bleaching process.

Bleaching as applied to Muscat raisins has never become popular in this country, nor is it certain that any common preference could be formed to make the process common. There are those who prefer bleached Muscats, and we already find quite a market. Their preparation is therefore worthy of the attention of some of our growers and curers of the Muscat.

The most beautiful large-seeded and high-priced raisins prepared in Smyrna are bleached as above and make a most inviting fruit. Well prepared, I believe they would form a novelty, which would prove profitable at least in limited quantities.

DEVELOPMENT MATTERS.

Address of the State Board of Trade.

The address to the public of the State Board of Trade, prepared by a committee in accordance with the authority granted at the last meeting of the Executive Committee, is as follows:

To the People of the State of California:—The coming season bids fair to be the most prosperous for the people of the Pacific Coast ever witnessed in the history of the State. The wave of prosperity which has swept over the southern counties has broken over the Tehachipi summit, and to-day is stirring the hitherto sluggish life-blood of Central and Northern California; the sharp advance in real estate prices, and the increased volume in sales, so noticeable at present in Santa Clara county, are cropping out in other localities, and if our people will but seize the present golden opportunity the tide bids fair to lead on to fortune.

What is wanted now by our people is a vigorous and energetic move all along the line to duplicate on a large scale the unparalleled prosperity which has blessed the southern part of the State—more than doubling the assessed valuation of the property of that section in one year's time. The prosperity which Southern California has enjoyed during the past two years can be ours if we will but help ourselves a little now that the golden opportunity has arrived.

In order that systematic work may be done in a business-like way, the State Board of Trade has been organized.

The first meeting was held in Oakland on the 15th day of July, at which meeting delegates were present from the principal cities and sections of the State, and the preliminary steps were taken toward perfecting the organization.

Organization of the State Board.

On the 23 day of August an adjourned meeting was held in Oakland, at which by-laws were adopted and A. T. Hatch of Suisun was elected president.

The by-laws provided that each Board of Trade, or other similar organization in the State, was to become a member of the State Board by paying an initiation fee and such monthly dues as might be fixed, by sending their delegates to the meetings of the State Board and selecting one of them as a member of the Executive Committee.

The third meeting was held in Oakland on Monday, August 15th, at which still further progress was made, and the work of the organization was thoroughly discussed.

After the meeting of the board there was a session of the Executive Committee, at which officers were elected and future work was partially outlined.

H. W. Byington of Santa Rosa was elected one of the vice-presidents, and the election of the others was postponed till the next meeting. J. M. Davies of Oakland was elected temporary secretary, and the Grangers' Bank of California was elected treasurer.

A Committee on Finance was appointed, consisting of A. T. Hatch of Suisun, E. B. Smith of Contra Costa county, and W. W. Camron of Oakland, whose duty it should be to take steps to raise the necessary funds to inaugurate the work in hand on a scale commensurate with its importance. Other committees were also appointed to look after different interests.

Displays in the East.

It was resolved to make a move at once toward having an extensive display of the resources of California at the Grand Army Encampment at St. Louis in September, and another display at an industrial exposition to be held in Boston, commencing the same month.

Acknowledging the well-known power of the press, the board resolved to secure, if possible, their active co-operation, and to this end the president and secretary were instructed to call a convention of the editors and publishers of the State to be held in the rooms of the Chamber of Commerce in San Francisco, at some time in the near future to be hereafter fixed, to consult together as to the best and most effective manner of advertising the resources of the State during the coming year. As in-

creased prosperity to the people means increased business patronage to the newspapers, it is hoped and believed that this call, when issued, will bring together representatives from every newspaper in California, and that much good may result therefrom.

The board voted to locate the permanent place of business in San Francisco, and a committee was appointed to secure suitable rooms in the very heart of the business center of that city to be occupied by the officers of the board, and in which a permanent exhibition of the productions of the State may be gathered for the benefit of the tourists and home-seekers from the East who visit our metropolis.

It is the intention of the State Board to advertise the productions of the State in every practical way possible. To this end pamphlets descriptive of various sections will be issued and scattered where they will do the most good, and arrangements will also be made for distributing large editions of established newspapers especially prepared for this work.

To Pay Expenses.

To do this work, money will be required. If we expect to succeed, money must be used liberally. If work cannot be done on a grand scale, it had better not be undertaken at all. If all who are interested will respond promptly, the financial work will not be a burden to any.

It is desirable that every Board of Trade in the State, and every organization of a similar character, shall join the State Board, pay the initiation fee and respond promptly to monthly dues. This will entitle such organization to three members of the State Board, including one member of the Executive Committee.

It is desirable that the heavy business men and large landowners shall contribute each a stated sum per month to the funds of the State board.

It is desirable that the press of the State take up this subject and give the movement a good hearty indorsement, in order that the work may be more easily and effectively accomplished.

If the response to this call is what it should be, one year from to-day Central and Northern California can record as rapid a gain in population and assessed wealth as the fortunate counties of Southern California are now so justly credited with.

It is the desire and purpose of the State Board to pay especial attention to building up all sections of the State, and particularly Central and Northern California; to assist in sending excursions from time to time from San Francisco to all parts of the interior, from Shasta to the far south. This series of excursions will be inaugurated as soon as the board is in working order.

Places Represented.

During the meetings thus far held representatives have been present from San Francisco, Oakland, Alameda, Livermore, Haywards, Niles, Sacramento, Marysville, Vallejo, Suisun, Vacaville, Red Bluff, San Rafael, Petaluma, Santa Rosa, San Mateo, Napa, Stockton, Lodi, and Fresno, thus showing the extensive interest taken in the work.

The next meeting of the Executive Committee will be held at the Board of Trade rooms, on Tenth street, near Broadway, in Oakland, on Monday, August 22d, at 11 A. M., at which time and place every local Board of Trade, or other similar organization in the State, should have an able representative, prepared to represent the voice of its constituents in a way that shall not be misunderstood, for the good of California.

In the meantime, we ask the people of the State to arise as one man and stand firmly by the State Board of Trade, and assist it to do a work that will add thousands to the census-roll and millions to our wealth.

By the Committee: A. T. HATCH, President.
J. M. DAVIES, Secretary.

Something About Booms.

EDITORS PRESS:—Several items in the RURAL of late in regard to the employment of white labor—women, boys and girls—in the orchards, canneries and packing-houses in the upper part of the State, have led me to the conclusion that you are on the eve of a genuine boom.

As a resident of Riverside for over 15 years, and a reader of the PRESS for some years previous to that, I feel that I can say something on booms which may interest some of your readers. Riverside may be termed the origination of the fruit-growing colony system, and all of the newer fruit-growing colonies or settlements have looked up to her more or less, copied her example and profited by her experience.

One thing is absolutely necessary in founding a new colony, and that is that the land selected be cut up into small tracts, and that each of these small tracts be capable of supporting a family in comfort. Cheap land is a detriment, as it enables speculators to buy up and monopolize large tracts to the injury of the whole. The most successful way at the present time is for a company or an individual to get possession of a large tract of suitable land in a good location. A good location can be dispensed with, however, for if other things be suitable, a prosperous colony will ultimately make a good location. Take Riverside as an example. When I first came to Riverside it took longer to get the RURAL PRESS from San Francisco than it now does to get a newspaper from

Chicago or New York, and sometimes in winter we would be cut off from the outer world for two or three weeks. Now everything has changed. We have one railroad with ten trains per day and another projected; also telegraph and telephone with street-car lines, none of which would have been in our valley but for the settlement made nearly 17 years ago.

But to resume—when suitable land has been secured, the projectors of the new settlement lay off a townsite with adjoining lands cut up into five and 10-acre tracts. Roads, streets and avenues are all laid out, graded sidewalks are added, and if trees are not planted, arrangements are made requiring the purchaser to plant some suitable kind of roadside tree. Then water is brought in and piped to every lot, thus doing away with unsightly ditches. A hotel is usually among the first buildings—generally put up by the company, and almost in advance of settlement. Then, if not on a line of railroad, one is pretty sure to follow shortly after. In consequence of so many improvements being made in advance, a nucleus is formed, and when the lands are put on the market the colony is started, a newspaper and postoffice are established and the settlement is under full headway. The fact of so many improvements being made previous to putting the lands on the market necessitates high prices for land, thus keeping out an undesirable class of settlers. The Eastern man of means, seeking a home with a congenial climate, finds everything ready made to his hand, and although he pays a good price, he finds that every improvement he makes, combined with his neighbors' improvements, enhances the value of his land, and in a short time he is on the way to a comfortable living.

In addition to what has been said about our methods, there is another thing which brings me back to the items in the PRESS which suggested this article, and that is in relation to the employment of Chinese. Up north you will find, as a rule, that the more Chinese are employed, the less desirable will be the neighborhood. In fact, self-respecting people will not voluntarily choose to live in proximity to Chinese. The average Eastern man may have his theories in regard to the Chinese before coming, but usually it does not take long on closer acquaintance to change his mind. In the early days of our settlement—and to day it is still much the same—every man worked in his orchard and the women cared for the flower-garden. Frequently one, or both, were in poor health before coming here, and the bright sunshine and the open air were all the medicine needed to bring round perfect health; but if it had been the custom to delegate these labors to Chinese, necessity would have prevented them from getting that exercise in the open air which nature demanded.

I know there are some in your part of the State who insist that they have a right to employ whom they please. This we deny, but will not argue the point now, though we will say that if you expect to share in the prosperity of the southern part of the State, you will have to discourage the employment of Chinese in all practical and rational ways. Self-interest will ultimately decide this question. If the 150,000 Chinese in this State could be replaced by white labor, it would involve an increase to our population of 300,000 or 400,000 white people. One more remark and I will close. It will be found that to insure the highest success, more or less irrigation will be required. It will pay in almost any part of the upper and central parts of the State to irrigate, and many crops cannot be as successfully grown without as with water. It may be that in many places not much is required for irrigation, but every one wants to have pure water under pressure piped to his house and flower-garden. Here is a suggestion to some of your large land-owners. "There's millions in it." To be sure, it takes money to do it, but in just such ways has the boom been started in Southern California, and so many fortunes made and the foundations for others laid. It is best, of course, to go slow and not expect too much. Begin by offering land at such prices that those who are driven off by high prices here will be glad to secure good homes elsewhere. Make things as pleasant as possible, so that they will not so much miss what they have left behind, and before you know it the new order of things will be started in Upper California. JAMES BOYD.

Riverside, Aug. 9, 1887.

The Boom at San Jose.

EDITORS PRESS:—As you are informed through the daily press, a genuine "boom" has struck the modest little city of San Jose. At last the fossils and mossbacks who for several years have been watching with envious eye the mammoth Southern boom, yet recoiling at the idea of risking a few dollars in advertising to the world the unlimited resources of the great Santa Clara valley, realize at last that the boom has come, and practically of its own accord.

For nearly two weeks the excitement has run high; the average price of good building lots has tripled, while land in all sections of the county has increased in value at an astonishing rate. Real-estate men refuse to talk with you on any other subject; speculators have swarmed in from the rural districts as well as from San Francisco and Los Angeles, and they can barely spare the time to eat their daily meals. The real-estate houses, which have rapidly increased in number during the past week, present

a sight never before seen in the Garden City. They are as crowded as a stock exchange from early morning to late at night; for several days they refused to disperse till after midnight. A crowd of private individuals who have made investments hang around the entrances buying and selling real estate without the formality of a third party. If you see two or more persons on the street engaged in private conversation, you may be sure they are talking real estate. "Thirty dollars a front foot," "Five hundred advance," "Balance in 30 days," are the expressions that greet you at every turn until they are so familiar that you cannot ignore the use of them yourself. To make a long matter short, everybody is talking real estate, thinking real estate and dreaming real estate.

The excitement began about two weeks ago, when a great furor was started in the office of Montgomery & Rea over Alameda and Stockton avenue lots. The new electric railroads which are soon to be in running order on these popular avenues, together with the situation of the university and the fine residences already there, had much to do with the starting of the excitement. At first lots were sold for \$10 and \$15 a front foot, then \$20, \$30 and \$40, and at present it would be extremely difficult to find any desirable lot fronting on one of these famous driveways that can be purchased for less than \$60 or \$70 a front foot.

After the first impulse the boom began to spread. From the university tract it extended to other parts of the city, and prices began to advance in every section at a rate never before known in these parts.

On the 9th inst. a syndicate, composed of the directors of the Garden City bank, purchased the Maddox property for \$60,000, reserving it for the site of a grand hotel; last Friday they were offered \$100,000 for it. Immediately real estate began to advance in that section at a wonderful rate; and at present almost every piece of property in the neighborhood has changed hands many times, every turn meaning an increase of from \$5 to \$7 a front foot.

And now the question is asked,

Is This Rapid Advance Genuine?

Is San Jose property really so valuable as these rates would indicate? How long the present excitement will last is, of course, a matter of speculation; but to the pioneer who is intimately acquainted with all parts of the State, the productiveness of the soil and the healthfulness of the climate, and who is familiar with the many advantages of this valley, it means a bona fide advance in property that is worth all it is bringing.

San Jose has improved wonderfully during the past year. A new electric road connecting the cities of San Jose and Santa Clara, in process of construction, together with a similar one to be built on Stockton avenue; a new city hall, to cost \$150,000, on which work has already begun; new iron bridges soon to span the Los Gatos and Guadalupe creeks; improved streets and sidewalks, a magnificent hotel soon to be erected—all these improvements, together with the many costly residences which are rapidly increasing in number, pretty drives that challenge comparison, numerous popular resorts within easy access, a climate unexcelled in the famous West, beautiful scenery surrounding on every hand, the largest telescope that this wonderful world has ever produced within the boundary of the county on the east, and the site of its grandest institution of learning on the west, the center of a great fruit and wine-producing district—all these facts add to her attractiveness as a home for luxury as well as a money-making center. The advance of San Jose has been slow, but it has been sure. Every step has been a determined one, and one that never retrogressed. It is safe to say that land in this valley will never again be as cheap as it is to day.

The fact that property in the Santa Clara valley has hitherto been held at too low a figure is beyond question, when it is compared with other sections in the productiveness of its soil, the healthfulness of its climate, the beauty of its surroundings and its advantageous situation, being but a few miles from the metropolis of the West. A university of high standing, excellent Catholic college, State Normal school, fine public-school system, besides the many private institutions of lesser fame, declare it without question an educational center. The numerous churches and beneficent societies speak for its moral tone, the character of its people, for its society.

So we may say in all confidence that San Jose and Santa Clara county have started on a new era, and, disregarding the present boom, it is bound to advance. It may not be an advance allied to that of some Southern districts; but it will grow, become more attractive and increase in population. Its institutions of learning, of which we are now proud, will increase in strength and usefulness; its pleasure resorts will be made more attractive, its drives more beautiful. Clinging to its reputation of "The Garden City," San Jose will become a place of costly residences and happy homes, a place where retired farmers, journalists, lawyers, merchants, and men of every profession and vocation, who wish to find a quiet home for the remainder of their days, may come and locate. Surely there is a grand future before San Jose and the valley in which it is located.

San Jose.

FRUIT MARKETING.

New York Fruit Auction Described.

A special dispatch from the New York Bureau of the *Morning Call* gives the first description we have seen of scenes at a New York auction of California fruit. We quote as follows:

The auction-room is at the corner of Broad and Beaver streets, and in the upper story of a building in which more fruit is sold daily than in any other place in the United States. Climbing up several flights of stairs, the auction-room is reached. The special feature of attraction in this room, when your correspondent visited it, was a display of samples of a carload of California fruit which had arrived during the day and which fruit was sold soon after and within a few hours of its arrival. The principal display made was of peaches, pears, plums and grapes. The boxes or packages were placed on a frame-work, upheld by wooden "horses," which stood in front of the auctioneer's stand, and the display also extended around the side of the room to his right for a short distance. The fruit was large and very handsome, with the exception of the grapes, which last, to tell the exact fact, were nothing like what can be produced. It was, however, early for grapes. The varieties of grapes were Muscats and Rose of Peru. The peaches commanded general admiration for size and color, and so also did the pears, on the part of perhaps 150 buyers who gathered around to examine them. But the special admiration was for the plums.

Peaches and Pears.

The peaches and pears arrived very ripe. Some were considerably decayed and all gave evidence of complete ripeness, so that a speedy sale was desirable. The journey across a hot desert had ripened them very fast. But the plums, beautiful in color and fine in size, as they were certainly in flavor, called forth expressions of the warmest praise. The fruit was all packed in paper—that is, each peach, pear and plum was wrapped separately in a fine white tissue covering. These papers were cast aside as the fruit was brought to view for critical inspection. There being but one carload to dispose of on this occasion, the buyers were fewer than when the lots are larger. There was also a larger proportion of retailers present. Among the latter were many Italians. An unbroken line of dealers surrounded the samples from an hour or less before the sale up to the time for the auction to begin—11:30 A. M. One of the busiest men in the room was Mr. Day of Sgobel & Day, who arrived some time in advance of the auctioneer, accompanied by Mr. Blois, manager for the agents of the California Fruit Union. Mr. Day was provided with a California fruit catalogue, as indeed every person in the room was, and on this he made entries as he inspected. Before the sale there was ample time to inspect the surroundings.

The Auctioneer.

The auctioneer has a raised stand, with an arrangement much like a reading-desk in front of him. To the right and left of him are raised platforms extending a short distance. Over his head is a large bulletin board, on which are painted the conditions attending the sale of green fruit. Among these conditions are the following:

Cash—no allowance for anything (except the customary damage for brimstone, if any); fruit to be delivered to the purchasers at their places of business in this city upon payment of the regular cartage for the same, etc.; a deposit of 20 per cent in current funds, where required on account of the purchase.

The room is large and nearly square. Two sets of windows light it from the sides, and overhead are two huge skylights, which are raised and lowered by ropes, of which enough are attached to the walls to make quite a respectable showing of "rigging." The room is therefore light enough to show off all the beauties, as well as the imperfections, of the fruit offered by sample for sale. Of course, only sample boxes or "packages" are brought to the auction-room. The great skylights not only make the room lighter, but also play a very important part in ventilation and thereby in preserving the green fruit in warm weather, as may be imagined. The climate at less sultry seasons than the present is hinted at solidly by two large stoves, at present disconnected from chimneys, and which stand in the rear of the room. The benches on which the buyers are seated during the sale are arranged for the most part in rows in front of the auctioneer's desk, but there are also other seats at each side of his dais. Three hundred or more persons—perhaps 400—can be easily seated. The weather has streaked the walls of the auction-room, but at present little will probably be expended in the way of beautification, for the reason that the fruit auction business has grown so that a new building, to cost \$70,000, is now going up at the corner of State and Bridge streets. The new building will be opened this fall. It is directly opposite the office of Sgobel & Day. The present auction-room is only a short distance from the office of the agents.

Features of the Sale.

About 11:30 o'clock a dapper and pleasant-looking man, who is neither Brown nor Secomb, but who is to act as auctioneer on this occasion, appears, and at once proceeds to business.

He first sheds his coat and vest and dons a thin linen coat out of deference to the weather and the exertions which he is immediately to make. Having done this, and having looked over his catalogue, and also having made a rapid and probably exact estimate of the buyers assembled, for he has many years of experience, he mounts the rostrum, whistles through a tube to some one in a lower story, and then begins the sale without more ado. The most of those present as buyers have taken seats, but there is still a fringe of retailers, who evidently intend to buy the samples, and who stand near the packages, looking at the fruit critically. Warm weather ripens fruit and makes a market for it; also, it calls out its distinctive insignia—the straw hat. Most all the dealers have on straw hats, and they wipe the perspiration from their faces as they lean back, catalogue and pencil in hand, to bid and check. Mr. Day is on the platform close to the auctioneer, and checks on his catalogue. Mr. Blois sits at his left, ready to act as soon as the sale is concluded. He also "checks."

Fruit Connoisseurs.

It must at once occur to the casual onlooker that this gathering makes up the most critical jury possible on California fruit. It is entirely a business transaction, and they judge every package in the light of profit to themselves, the only question being just what it will bring—what they can get for it. They are not Californians, have no pride in advancing the fruit as a Californian product, and, of course, would just as soon sell fruit from any other section, if profit is found thereby. Therefore if the California fruit makes any headway in this auction-room before this jury it has the indorsement of the set of men best competent to judge as to its merits probably to be found east of the Sierras. That it is making headway and that this is manifested by the widening circle of buyers has been mentioned in preceding dispatches. Not only on the score of impartiality, but also on the ground of experience, will it be seen that these buyers are qualified to judge. They are not novices in handling fruit by any means, the majority, if not all, of those in the room having been "raised in the business" from boyhood. And as this audience, engaged on this business, possesses at this time and in this place a peculiar interest for Californians, your correspondent regrets that he had not an instantaneous photograph, that the shipper in California might see the scene for himself. The buyers are largely middle-aged men. They bid in what they want with little noise, following the nimble tongue of the auctioneer as he climbs the financial stair. The sale is over speedily. In ten minutes the carload has been sold; those who wanted the samples have secured them. This is therefore quick and certain work. The fruit has not had much opportunity since it arrived to come to harm before it has changed hands and become the property of others.

The Purchasers.

The purchaser is equally interested with the shipper in an expeditious service. As soon as the sale is over Manager Blois is on the move. He verifies the prices as he has checked them, and at once sends out a dispatch to the California Fruit Union, so that the prices received ought to be known in California soon after the auction—perhaps in an hour. The arrangements for the transfer of the fruit to the premises of the purchaser are systematic. The sale closes at about noon—a little earlier. By 1 o'clock the drays will have delivered a large part of the fruit. At night a good share of it will be on the tables of well-pleased New Yorkers, and California fruit will be brought into hundreds of homes, in fact.

Immediately after the California sale the sale of oranges, lemons, etc., begins. With more fruit and more buyers the scene is more animated, but the foregoing is a fair outline as it is from day to day. In the city markets choice Bartlett pears from California are \$1 a dozen. Native pears are coming in slowly and are poor. Native grapes are scarce and high. Delawares are 40 cents a pound and Niagaras 30 cents. Concord are more plentiful for 15 cents a pound. California green-gages, Gros prunes and yellow-egg plums are 35 cents a dozen. Best selected peaches are still those from California, and cost 60 cents and 75 cents a dozen. Best Delaware fruit is \$2.80 and \$3 a basket.

WOULDN'T LOSE A SINGLE COPY.—One of our subscribers in Los Angeles county, writing for a back number of the *RURAL PRESS* which had failed to reach him, says: "I calculate to have the papers bound in book-form at the end of the year, and don't want to lose a single copy. Think I have been benefited already ten dollars' worth by a recipe for prevention of damage to 'cots by June-bug.' We doubt not that many of our readers could give similar evidence—that even one article in the paper has sometimes been worth to them more than the price of several years' subscription."

OREGON AGRICULTURAL COLLEGE.—The corner-stone of the new building for the State Agricultural College was laid on the college farm near Corvallis, on the 17th inst., by the Grand Lodge of Masons of Oregon. Gov. Penney, Supt. McElroy, Judge Strahan of the Supreme Court, and a large number of distinguished citizens from other parts of the State were present.

THE Napa and Solano Agricultural Fair is to be held this year at Vallejo.

A Horticulturist in Arms.

EDITORS PRESS:—"Ye" horticulturist has buttoned on his uniform and joined his company, and is now in camp under camp regulations for a week, where instead of the shrill chattering the morning drum and cannon arouse from slumber. It is somewhat of a change, but rather enjoyable than otherwise. As is generally known, our camp is in the same field with the First U. S. Infantry Regiment, which is greatly to our advantage in many ways, principally in the knowledge we will gain of military usage. We came into camp the morning of the 14th, and break camp the 21st. The camp is pleasantly situated just out of town, far enough away from the beach to miss the cold chill of the sea breeze and fog, although the fog comes up regularly every evening at dark and stays until 10 o'clock next day, which makes it pretty cool at night and in the morning, but not so much so as it is nearer the coast.

August 20th.—The excitement of the camp and the many attractions in the vicinity of Santa Cruz has delayed the completion of this article. The week has passed very pleasantly to the Guardsmen. The big trees, bath-houses, natural bridge, lighthouse, fishing excursions, etc., have been all "taken in," as the common parlance has it. Among the notable features of the camp was the appearance of Brigadier-General Carey and staff, and the review on the 18th.

Camp-fires and receptions nightly are the usual features of the evenings. There is a very marked improvement in the parades of the Guards. The opportunities for army instructions were never better on any camp-ground ever occupied by the National Guards, and all have profited by it.

While the writer has been in camp he has not kept his eyes closed on the subject of fruit-growing, and has learned many things. In the first place, Santa Cruz needs a cannery (so the fruit-raisers tell me), but probably the high price of labor, sugar and tin may prevent one being built. The climate is so damp that sundrying is not very successful (so I am told), necessitating the use of driers, and many beginners not being able to invest this season, have suffered loss from lack of sale in the home market. It seems to me that a neighborhood could consolidate on a central drier and thereby save their fruit. It is always best to be prepared to dry; then if the canneries pay a living price, all right; if not, dry. The quality of the fruit as regards size is inferior to our Sacramento valley fruit, but it is of good flavor, and appears to keep well. The plum appears to do well, also the pear and apple, but peach and apricot are not so good. The apricot which is now in the market is very spotted, all I have seen. It seems so strange that our apricots (150 miles farther north) are all gone 4 weeks ago, and here they are just in market. I think the peach and apricot here would make a good article dried. The sooner every locality in the State learns what fruit will do the best and then handle it the best way for market, the better it will be for the localities and all concerned in the fruit industry. The resources of this State are vast and various, and the horticulturist will have plenty of use for his brains to overcome all obstacles and adapt himself to his surroundings and location.

To-morrow we break camp, and the following week will find us all at our usual vocations, but the pleasures of this camp will never be forgotten, and I opine that the souvenirs of the trip gathered from various places will fill a niche in the what-not as a reminder of the happy times in Camp Shehan. J. R. SPRINGER, Santa Cruz.

A CONTRIBUTION TO CALIFORNIA HISTORY.—An historical document of the first importance will appear in the September number of the *Overland Monthly*, finally settling the difficult point of the exact date of the discovery of gold in the tail-race of Sutter & Marshall's mill. It is a record by the only man present who made an entry in his diary on the day of the discovery. H. W. Bigler was a member of the Mormon Battalion that was enlisted to aid in the conquest of California, and came across the plains in '47. After the disbanding of the Battalion he remained in California, and was employed in building the famous mill at Coloma. His diary is of the greatest interest, as well as of the greatest value historically, and is now printed for the first time. It was copied by Bigler himself, and slightly revised in orthography and syntax by Mr. John S. Hittell.

TWINE-BINDER TRIAL IN FRANCE.—A dispatch to the *Chicago Times* from Paris, dated August 11th, is as follows:

The most important international contest of twine-binders ever held on the continent has just been concluded at Etregagny, near this city. The trial lasted several days, and was characterized by the utmost fairness on the part of the judges, who were representative agriculturists of France. The result was an award of the first prize to an American machine (the McCormick) over all competitors. All the principal English and American machines competed, including the Hornsby, the leading English twine-binder. A desperate effort was made by foreign machines to capture the prize, but the award of the judges was unanimous, giving the gold medal and 300 francs to the McCormick.

Important Reduction of Railway Rates.

A matter of great public interest, and which will render timely service in the development of the State, is a reduction of passenger fares, which there seems reason to believe will be general. The proposition was first made by Commissioner Abbott to the managers of the Southern Pacific system, and they agreed to a reduction of all 6-cent divisions on their lines to 5 cents, 5-cent divisions to 4 cents and 4-cent divisions to 3 cents. The following account of the reductions, with illustration of their effects, is given by the *Call*:

The reductions on the various divisions will be as follows: Stockton to Milton and Oakdale, 4 cents; Galt to Ione, 4 cents; Sacramento to Redding, via Marysville, 3 cents; Davis to Redding, via Willows, 3 cents; Redding to Coles, through the Sacramento canyon, 4 cents; Sacramento to Auburn, 3 cents; Auburn to Truckee, through snowsheds, where there is no local traffic, 5 cents; Lathrop to Sumner, 3 cents; Sumner to Newhall, 4 cents, via Tehachapi pass; Newhall to Santa Barbara, 3 cents; Newhall south to Banning, including all roads round Los Angeles, 3 cents; Banning to Yuma through the Colorado desert, where there is no local traffic, 5 cents; San Francisco to Sacramento via Lathrop, 3½ cents; via Benicia, 4 cents.

Northern Division.

Northern division—San Francisco to San Jose, Monterey and Templeton, 3 cents. This shows the entire system, excepting the line from Berenda to Raymond, a distance of 21 miles, on which the local traffic is insignificant. On this a rate of 10 cents per mile has been made, it being the highest within the State.

A list of some of the most important rates I have brought with me, continued Commissioner Abbott, will enable you to appreciate the extent of the reductions. They are as follows:

	Present Rates.	New Rates.
San Francisco to		
Truckee.....	\$9.55	\$8.30
Redding.....	9.05	7.50
Tehama.....	7.20	6.10
Los Angeles.....	21.70	15.00
Fresno.....	7.60	5.90
Goshen.....	9.00	6.90
Tulare.....	9.40	7.25
Sumner.....	11.90	9.10
Stockton.....	3.30	2.50
San Jose.....	1.75	1.25
Livermore.....	1.75	1.25
Marysville.....	5.10	4.60

The rates from Vallejo to Suisun and to Calistoga will also be 3 cents per mile.

From San Francisco to Sacramento the company will issue a special ticket via Benicia to Sacramento at \$2.50, the present rate being \$3.30.

Of the other railroad lines Commissioner Abbott said: "They were doubtless waiting to see what the Southern Pacific intended to do about the matter. After we have entirely finished with the big system we will proceed to work on the rates to Cloverdale and Santa Rosa, throughout the Donahue system, on the same basis. We will then proceed to Los Angeles, where the rates of the California Central will be adjusted. As far as the North Pacific Coast line is concerned we do not expect to have much to do, as I understand the rates there are exceptionally reasonable."

Topics for Correspondents.

An Asparagus Bed.

EDITORS PRESS:—Will some of the readers of the *PACIFIC RURAL PRESS* tell me if asparagus beds can be successfully made after the fall rains, and also where I can be likely to get good plants? Any hints on the cultivation of the same will be gladly received.—MRS. V. HOPE, Blokesburg, Humboldt Co.

Limes in Tehama County.

EDITORS PRESS:—One of your subscribers in Red Bluff would be pleased if some one who is able, would, through your columns, give his opinion of the climate of Tehama county for the culture of limes, with any other information that a novice would find useful.—E. W.

For Windmill Experts.

EDITORS PRESS:—I find many intelligent persons who think it is harder to pump water into the bottom of a tank with 10 feet deep of water in it than to bring the pipe up to the top of tank and let it run in. Please state if there is any difference.

2. State which way is most desirable in putting up a tank.

3. State whether it is the best way in piping a tank to draw the water from the service or supplying pipe direct or to run a separate pipe down from the tank.—H., Chico.

ANGORA GOATS.—C. P. Bailey of San Jose exhibited 12 head of fine Angora goats at the Santa Clara Valley Agricultural Fair which, in weight of fleece and fineness of texture, would compare favorably with the best imported stock. Four head were selected of this exhibit to fill an order from Col. Peters of Georgia, who is one of the oldest breeders and importers of the Angora goat in the United States. Col. Peters commenced this business in 1849, and has followed it with signal success since. In selecting this lot from Mr. Bailey from the California stock, which is an emphatic compliment to our climate and breeding, he had in view the increasing weight and length of mohair in his own flock.

SUMMER SONGS, AUTUMN MELODIES, WINTER ANTHEMS, SPRING CAROLS,

By the thousand and hundred thousand, are found on the shelves of our great music stores. If not "bursting into song," they are at least fully weighted with the best and most popular music of the day.

It is in vain to give any idea of the wealth of our Sheet Music catalogue by any series of advertisements. Persons wishing to select will please send for lists or catalogues, or call at the "Ditson" stores (Boston, New York or Philadelphia), or examine the music with Ditson & Co.'s imprint in any respectable music store.

New music and books are faithfully and accurately described in Ditson & Co.'s MUSICAL RECORD, a monthly costing but \$1.00 per year, which dollar is amply repaid to every music purchaser in the information conveyed by the good Vocal and Instrumental music and well-made reading columns of this monthly magazine.

We mention, as prominent Music Books to be used the ensuing season: *Jehovah's Praise* (\$1.00), a fine Church Music Book by Emerson. *New Spiritual Songs* (35 cents), by Tenney & Hoffman, and the *Children's Oladem* (35 cents), a new and very bright Sunday School Song Book.

S. F. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, August 24, 1887.

The past week did not bring to farmers improved prices in any of the leading farm products. There is a boom in canned fruits, but then raw fruits are with few exceptions no better. Wheat has been inactive with the bears hammering prices down. At the East, wheat has been active at fairly steady prices, but in Europe the market has been against sellers.

Foreign Review.

LONDON, Aug. 22.—The *Mark Lane Express* in its weekly review of the British grain trade, says: The rainfall has checked the shipping and delivery of wheats, and consequently arrested the downward course of prices, although values in London and in some provincial markets have continued in favor of buyers. Estimates, based on the Government statement as to the acreage of crops for 1887, place the new yield of wheat at about 6,250,000 qrs., after deducting 6,000,000 qrs. for seed. The foreign wheat trade is devoid of feature. Russian and American samples are competing at the lowest rates.

Crops at the East.

CHICAGO, Aug. 21.—The following crop summary will appear in this week's issue of the *Farmers' Review*: Our reports do not indicate any material change in the condition of the corn crop in the different States as a result of the recent rains. Corn on high and dry lands was too far gone to be recuperated, but low-lying and late-planted fields have been somewhat delayed. There, however, is not a sufficient acreage to affect to any appreciable degree the general average of condition. Dakota alone reports a condition of the crop above the average yield. The wheat and oats report does not differ materially from the last reports.

Synopsis of the weather crop bulletin of the Signal Office during the week ending Aug. 20, has been slightly cooler than usual throughout the lake region and upper Mississippi and Missouri valleys. On the Pacific Coast the temperature differed but slightly from the normal. Well-distributed rains have occurred throughout the drouth regions, and reports this morning show that the rain continues in this section. The weather for the week has been favorable throughout the corn belt, recent rains having greatly improved the condition of crops, but owing to the lateness of rains in the principal corn-producing States the yield will probably be below the average.

Eastern Wheat Markets.

NEW YORK, Aug. 21.—Wheat closed steady at a shade above bottom prices. August, 79½¢; September, 80½¢; October, 81½¢; November, 82½¢; December, 84¢; January, 85½¢; and May, 89½¢.

CHICAGO, Aug. 24.—P. M.—Wheat easier; cash, 68 3/16¢; September, 69 1/16¢; October, 70 1/16¢.

California Fruit in New York.

NEW YORK, Aug. 22.—The sale of California fruit to-day was largely attended and all sound fruit did very well. Grapes and most of the peaches were in good order, but the pears were dead ripe and some had been blistered. Peaches brought 80¢@\$.25, according to quality and condition; pears, \$1.37 1/2 @\$.62 1/2, mostly too ripe and soft; Tokay grapes, \$3.35 a crate; Muscat grapes, \$1.87 1/2.

NEW YORK, Aug. 23.—About 2300 packages of California fruit sold at auction to-day. Owing to the arrival of the fruit train almost all the fruit had some decay. The prices, therefore, were lower than yesterday. Bartlett, Diel and Vicar pears sold at \$1.02 per box; Crawford and other peaches, 40¢@\$.1.05; plums, 85¢@\$.1.95; Muscat and Peru grapes, 60¢@\$.1.30.

Canned and Dried Fruit East.

NEW YORK, Aug. 22.—California raisins have been jobbing quite actively and bringing full prices. Two-crown, \$1.10@1.20; 3-crown, \$1.35@1.40; London, \$1.35.

A firm of this city which deals largely in California goods, sold more canned and more dried fruits last week than during the whole canning season last year. The advance in prices was not ascribed chiefly to the scarcity of labor, as indicated by dispatches from S. F., but to the lightness of the Eastern peach crop, as peaches and apricots were mostly affected. The firm refused an order to-day for ten carloads, or about 3250 cases of peaches, at a figure that would have been snapped up a week ago. At Baltimore, the prices of Eastern packed peaches in 3-lb cans is now from \$2.50 to \$2.70 per doz., as against \$1.50 to \$1.80 last year. The price in California is about \$2.35, against from \$1.90 to \$2 last year. The advance in apricots has been from \$1.40 to \$1.50 to about \$1.70. Prices of evaporated fruits have also risen largely. One order for peaches at 2 1/2¢ per lb was refused Saturday, though the usual price is 19 and 20¢. Apricots have advanced about 1¢ per lb. There has been considerable advance too in the prices of canned pears and plums.

California Fruit at Chicago.

CHICAGO, Aug. 19.—Receipts of Calif. fruit continue liberal. Several carloads arrived, one entirely of pears. The market shows a good demand. Pears are lower and other fruit is about steady. Michigan and New York have had a large crop of pears this season, which are now coming forward freely, and although dealers show a preference for California-grown, this output has caused lower prices. Bartlett pears were quoted at \$2.90@3; Beurre Hardy pears, \$2@2.25; Duchesse pears, \$1.50@1.75; Clairegrou pears, \$2@2.50; Orange Cling and late Crawford peaches, \$1.25@1.50; Muscat grapes, (double crates) \$3@3.25; Tokay, \$3.25@3.50; German and Gros pears and Quackenboss plums, \$1.25@1.50.

California dried fruits are firm. Apricots are the only description of new fruit coming in, and the arrivals of these are rather small, with good demand.

Raisins are scarce and firm. Apricots, evaporated, future delivery, 14 1/4¢@15¢; cash, 15¢@16¢. Raisins, London layers, 20-lb boxes, \$1.50; loose Muscatel, \$1.35; California layers, \$1.35.

CHICAGO, Aug. 23.—The market rules easy, especially for pears and peaches, which are lower. The following prices were quoted to-day for fruit in good condition: Muscat grapes (double crates), \$2.75@3; Tokay grapes, \$3@3.25; Clairegrou pears, \$2@2.25; Beurre Hardy pears, \$1.75@2; Bartlett pears, \$2.75@3; Orange Cling and late Crawford peaches, \$1.25@1.50; German and Gros pears, \$1.25@1.50.

California dried fruits are in fair request; offerings small; prices firm all around. Apricots, evaporated, future delivery, 14 1/4¢@15¢; do. cash, 15¢@16¢. Peaches, peeled, evaporated, 25¢@27¢; do. unpeeled, evaporated, 14¢@16¢; do. unpeeled, sun-dried, 10¢@12¢. Raisins, London layers, 20-lb boxes, \$1.50; loose Muscatel, \$1.35; Calif. layers, \$1.35.

Eastern Wool Markets.

BOSTON, Aug. 20.—The demand for wool has again been active, and sales amounting to 2,653,100 lbs have been reported. The tone of the market is rather stronger, but no higher prices are expected for the present. All grades are now selling well. Fine washed fleeces, which were first to experience the recent shading in prices, are now quite firm at quotations. Territory wools are in large supply, but moving off well, and new wools arriving from Montana and other sections are in excellent condition and meet approval. Among the sales of the week were 132,000 lbs Calif. spring and Oregon at 19¢, 80,000 lbs Calif. fall on private terms, and 54,700 lbs. Territory at 19¢@26¢.

NEW YORK, Aug. 21.—The market remains unchanged and sellers see no opportunity for higher rates. Among sales were 1000 lbs burry Calif. at 14¢.

The Philadelphia market shows no improvement; manufacturers buying only when concessions are made. Among sales were 1000 lbs scoured Calif. at 52 1/2¢, 3500 lbs do. at 60¢, 1000 lbs Montana medium at 25¢, 25,000 lbs Territory coarse at 17¢, and 11,000 lbs Territory medium at 22¢.

Eastern Hop Markets.

NEW YORK, Aug. 22.—Hops are in light demand. The English crop outlook is improved by recent rains. Coast crop of 1886, best, 16¢@18¢; good to common, 13¢@15¢; 1885, good to prime, 8¢@10¢.

CHICAGO, Aug. 23.—There is no change in hops. Old hops are scarce and no new goods have been placed on this market yet. Inquiry from brewers is limited and dealers are waiting to see what the prospect for a market on new hops will be; 1886 California range from 15¢@18¢; 1886 Washington Territory, 22¢@24¢.

Local Markets.

BAGS—There is an active movement in the market, with sales of 6,000,000 for delivery in June-July, next year, at 5 1/4¢ and 6 cts. The high price of the raw material in Calcutta is against low prices.

BARLEY—Heavy receipts have ruled throughout the week, but the market has not been materially affected. Call opened on Monday with barley weak and low, but it advanced on Tuesday. Today's sales were as follows:

Morning Session: Buyer 1887, old contract—200 tons, \$1.07 1/2; 100, \$1.06 1/2; 100, \$1.06 1/2. Seller 1887, old contract—100 tons, 93¢ per cbl. Afternoon Session: Buyer 1887, old contract—100 tons, \$1.05; 100, \$1.03 1/2. Seller 1887, old contract—100 tons, 93 1/2¢. Buyer season—100 tons, \$1.12 per cbl.

BUTTER—The market is soft and slightly lower under freer receipts of fresh rolls. The trade has been running more on pickled, owing to its relative cheapness.

CHEESE—The market is very strong, with a good demand ruling. The East is firm at a slight advance.

EGGS—Strictly choice fresh laid are scarce and command full prices. Other qualities are stronger.

FLOUR—On Friday last a further reduction of 10 cts per bbl. was made. The market is well supplied, with the demand, at the decline, improving.

WHEAT—Trading in the sample market is slow. The Call Board opened on last Monday. Trading each day was light, with the bears hammering prices down. The fight of dealers a few weeks ago was against the bulls, and it now looks as if the fight of farmers will have to be against the bears. Transactions on Call look very much like cross orders. To-day's recorded sales were as follows:

Morning Session: Spot—200 tons, \$1.40; 100, \$1.39. Seller 1887—100 tons, \$1.37 1/2; 100, \$1.37 1/2; 100, \$1.36 1/2; 100, \$1.35 1/2 per cbl. Afternoon Session: Spot—100 tons, \$1.36 1/2; 100, \$1.36; 100, \$1.34 1/2 per cbl.

[COMMUNICATED.]

Market Information.

Cereals.

The total exports of wheat from Australia to Great Britain during the first 7 months of 1887 were 2,688,000 bu., against 400,000 bu. for same time in 1886. The exports of flour, however, were only 6000 bbls, against 110 000 bbls in 1886.

With all the brilliant prospects in Europe and the falling off in the United States it is stated that the wheat crops of the United States, England, Russia and France, will exceed that of last year only 28,000,000 bu. This will only offset the deficiency in India.

The new crop of Canada barley is reported bright, and of good malting quality, but weight 3 to 5 lbs lighter per bu. than last year's crop.

Quantity of barley on passage to the United Kingdom, July 28, is estimated at 1,460,000 bu., against 410,000 bu. for the corresponding time last year.

In Germany, at last postal advice, the harvesting of rye was interrupted by rain; otherwise the weather has continued favorable. The rye crop, so far as harvested, has turned out satisfactorily; and wheat is said to promise even better results. As to oats and barley, reports vary. Potatoes will be a good crop.

Exports of wheat from India for the week ending August 13 were 180,000 bu., of which 100,000 bu. were forwarded to the United Kingdom and 80,000

bu. to the Continent. The total shipments from January 1 to August 13 were 23,880,000 bu., of which 11,760,000 bu. were to the United Kingdom and 12,120,000 bu. to the Continent.

Postal reports from Roumania say that splendid harvest weather has prevailed along the Danube, and much of the grain has been cut and few parcels delivered. The quality of the grain is said to be excellent, and a larger proportion than usual of heavy weight, as the weather has been so favorable—wheat weighing 59@64 lbs; rye, 55@60 lbs, and barley 45@53 lbs to the bu. The maize crop has been much improved by recent rains.

The Toledo Produce Exchange circular says: Baltimore correspondents and the State Agricultural Departments say that Pennsylvania, Maryland and Virginia wheat crops are very deficient, and that this is especially developed in thrashing. We do not believe a State in this Union will produce a full crop of wheat. Dakota is making great claims, but there is too much land for sale up there, and it is safer to rely on other statements. The Government makes the promise there 88, but gentlemen of repute, Dakota farmers, state that the Government estimate is much too high.

From *Dornbusch*, London, Aug. 5, we obtain the following: The trade remains quiet and observant, but distrust of the situation at home and abroad prevents the initiation of fresh business, while the closing of contracts now maturing will not inspire confidence or give buyers courage for the coming campaign. So far as breadstuffs are concerned, Europe is resting in the lap of plenty; good crop reports are the rule, and the wheat as it leaves the field is ready for the mill; thus at the outset native produce will get to the weather side of imported breadstuffs, and, as a natural consequence, take the wind out of the sails of the latter. Under these circumstances buyers of foreign grain are likely to act with unusual caution, which even a spell of wet weather would not wholly overcome.

On this coast there is nothing new to report. Farmers who have not sold are disposed to store, only selling enough to pay current expenses. The grade of the Washington Territory and Oregon wheat is above last year's; but in this State it is considerably below. Samples of wheat have been received which look plump and fine but have no bread-making power. Trading in our market was light last week, hardly enough to make quotations. No. 1 wheat shipping has sold readily to short sellers at \$1.50. It is claimed that very little of this grade can be had. Milling wheat has sold all the way from \$1.60 to \$1.75 per cbl; the latter figure was only obtainable for two parcels of extra choice gilt-edged well situated, and therefore cannot be quoted as a correct reflection of the market. Quite a number of vessels were taken the past week to load wheat for U. S. K.

Barley, under continued heavy receipts, ruled weak at low prices up to yesterday, when a higher range was established under a free speculative movement on Call. The consumption continues very large; if anything, it shows an increase over last month. The last vessel for Australia took out about 700 tons of chevalier. It is claimed that other purchases have been made for the same destination. Considerable brewing has been taken, chiefly for Eastern account.

For oats the market is weak at quotations, owing to excessive supplies and only a moderate demand. Owing to light crops at the West it is hardly likely Nebraska will send us oats this season.

Corn is stiff at full figures, notwithstanding free receipts. The supply of choice grades is light, but inferior grades are in overstock for the immediate future.

In both rye and buckwheat there is nothing new to report.

Feedstuff.

Both bran and middlings are easy at lower quotations. The supply appears to be increasing, with a stronger selling pressure reported. The consumption appears to be increasing.

Ground and rolled barley are in liberal supply, with prices steadier at the close. The consumption is free. Other feedstuffs are unchanged.

Hay, if choice, is wanted at extreme figures. The supply in the country is reported to be rapidly decreasing under free-buying orders from large consumers. In this city, dealers are reported to be fairly well stocked, but as stablemen are boarding more horses, stocks require almost constant replenishing.

Fruits.

There is some inquiry for raisins from the East, with sales reported to have been made for future delivery for shipment to Chicago and St. Louis, but no particulars are obtainable.

In dried fruits there is a very active demand, but dealers are asking more money, which at present buyers do not appear disposed to give. With the large consumptive demand from the East and an increasing call from England for certain varieties, it looks as if the market ought to do still better. The quantity dried this season is very heavy—apricots and peaches going from 10 to 15 times last year's output. The quality also shows a decided improvement.

The market for raw fruits the past week was glutted with overripe pears and peaches, not only necessitating low selling prices but also dumping to get rid of consignments. The canners received large quantities on early contracts, much of which they were forced to put on the market. On Monday last the market was fairly well cleaned up of all desirable parcels, causing a stiffening in prices which was followed by an advance for the more solid peaches, pears, plums, etc., the demand coming from both canners and the trade. Apricots are going out, as are blackberries and raspberries. Choice plums and prunes are wanted. Strawberries continue in good supply.

Grapes are in larger and improved variety. The heavy supplies of other fruits operate against them. The choice table varieties are freely taken for shipping up North, both by rail and steamer. Wine grapes are coming in and find a ready market.

Watermelons and canteloupes are in heavy stock. The demand is active.

Live-Stock.

Bullocks continue to rule weak under free selling. The low prices ruling this summer are a source of considerable surprise, and can only be accounted for by some large cattlemen breaking up their herds so as to sell land to the incoming immigration. Another thing, the past few winters have been mild and

therefore favorable for cattle. Mutton sheep are offering quite freely. Hogs are offering fairly well, enough coming in to keep prices down. In horses there is nothing new to report.

The following are the wholesale rates of slaughtering to butchers:

BEEF—Extra, 7¢@7 1/4¢; first grade, grass fed, 6 1/4¢@6 3/4¢ per lb.; second grade, 5 1/4¢@6¢; third grade, 4 1/4¢@5 1/4¢.

MUTTON—Ewes, 5 1/4¢@6¢; wethers, 6¢@6 1/4¢.

LAMB—Spring, 7¢@8¢.

VEAL—Large, 6¢@7¢; small, 6¢@8¢.

PORK—Live hogs, 4 1/4¢@4 3/4¢ for heavy and medium; hard dressed, 7¢@7 1/4¢ per lb; light, 4 1/4¢@4 3/4¢; dressed, 7¢@7 1/4¢; soft hogs, live, 3 1/4¢@4¢. On foot, one-third less for grain or stalled, and one-half less for stock running out.

Vegetables.

The better qualities of tomatoes are taken by canners, the short pack at the East causing them to run quite freely on tomatoes here. The market has shown considerable fluctuations.

Pickling onions and cucumbers found larger sales this season than ever before; probably this is due to the short crop of vegetables at the West.

In cucumbers and other seasonable vegetables the market fluctuates from day to day according to the supply and demand.

Choice potatoes have a firmer tone although not quotable higher. Poor potatoes are hard to sell. Sweet potatoes fluctuate from day to day.

Choice onions are in fair demand, but 'poor are hard to sell even at marked concessions in prices.

Miscellaneous.

Poultry ruled fairly steady throughout the week. Honey is wanted at a further advance. The market closed strong.

In hops, buyers are still trying to beat down the market. At the East, stocks are light, consumption large, with the crop outlook favorable for a larger output than last year's.

Fall wool coming in is poor in grade, dirty, seedy and burry, and altogether unfit for Eastern buyers, except at low prices. They range from 8 to 12 1/2¢, while for clean but burry a slight advance might be obtained. Choice fall will fetch 15 to 18¢, perhaps even slightly more.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	297,723	313,749
In port, disengaged.....	56,308	58,201
In port, engaged.....	35,006	68,652

Totals.....389,037 440,602

The above gives a carrying capacity as follows: 1887, 621,459 short tons; 1886, 704,963 short tons; showing a decrease compared with last year of 83,504 tons.

San Francisco, August 24, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

Treatise on the Olive.

A new publication entitled "A Practical Treatise on Olive Culture, Oil-making and Olive-pickling," by Adolphe Flamant of Napa, has just been published by Louis Gregoire & Co. of this city. It is a very handsomely printed pamphlet of 76 pages and treats in a succinct manner of soils for the olive, propagation of the trees, general care of them, cost of a plantation, diseases of the olive tree, varieties of the fruit, with practical instructions for oil-making and olive-pickling. The author is himself an olive-grower of some years' standing in Napa county, and in addition to the facts thus learned, he manifests a wide acquaintance with the literature of the subject at home and abroad. The publication is very timely, as there is so much demand for the facts which Mr. Flamant sets forth. Copies can be had at this office for \$1 each.

HENSLEY'S ORCHARD CULTIVATOR.—Much interest was manifested in the orchard cultivator of C. M. Hensley, as exhibited at the San Jose Fair last week. The implement is so adjusted that the weight of the man is used to lift the teeth out of the ground when the lever is applied, and, being released, the teeth enter the soil again. This arrangement is very highly praised by practical orchardists who have seen it in operation. By an adjustment the implement is made into a side-hill cultivator of merit. This is considered of much importance in view of the fact that so much hillside is being put into orchard and vineyard.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARROLD C. HOAG—California.
G. W. INGLIS—Arizona.
Geo. McDowell—Monterey Co.
W. J. FARMAN—Nevada.
J. L. DOYLE—El Dorado Co.
WILLIAM POOL—Fresno Co.
R. G. HUSTON—Butte, Montana.

B. R. McPHERSON—Santa Barbara Co.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

A LITTLE WET.—Read about the Cutlery and Spoons from the Ackerman fire, now offered at half price by Smith's Cash Store, 115 Clay street. If our readers are about to order, they would do well to send to this house for full price list of family supplies.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

ALTMAN FRUIT-DRIER.—Mr. F. Altman of San Jose exhibited at the fair last week his fruit drier, which he has been experimenting with for a number of years. It was put in practical operation on a large scale with marked success. It is built in a circle and the drying shelves are moved around by a crank. The application of heat is arranged so that there is an even distribution to all parts of the cylinder and the moisture and carbonic acid gas is drawn out and passes off with the smoke from the fuel. Several experts who were present and examined it closely pronounced the operation superior to any practical test they had ever witnessed. The drier can be built of brick, wood or iron, and of any size that may be desired for small or large orchards. This new invention is worthy of careful attention from orchardists as an effective, cheap and superior drier. We will give an illustration, with a cut and more extended description, in the RURAL in a short time.

HEREFORD CATTLE.—Vaughan & Williams, agents for James Kay, England, have established themselves permanently on this coast. In the last seven years they have imported 7800 cattle and horses into the United States. The celebrated bull Novelist, that took the challenge cup at Longridge, England, in 1886, has just arrived and will be on exhibition at the State Fair.

Young and middle-aged men suffering from nervous debility, loss of memory, premature old age, as the result of bad habits, should send 10 cents in stamps for large illustrated treatise suggesting unfailing cure. Address World's Dispensary Medical Association, Buffalo, N. Y.

Coming Home to Die.

At a period of life when budding womanhood requires all her strength to meet the demands nature makes upon it, many a young woman returns home from the severe mental strain of school with a broken-down constitution, and her functions disarranged, to go to an early grave. If she had been wisely counseled and given the benefit of Dr. Pierce's "Favorite Prescription," her bodily development might have kept pace with her mental growth, and health and beauty would not have given way to decline and death.

Chronic nasal catarrh—guaranteed cure—Dr. Sage's Catarrh Remedy.

Imported Holstein Bull for Sale.

The imported Holstein Bull Jacob Wit's Conesus is offered for sale; price \$300. Payment will be taken, if so desired, in steers.

PEDIGREE—(H. H. B. vol. 8, No. 3457.) (Ear No. 836.) Calved March 14, 1884. Three-fourths black, strip in face, four small white spots at shoulders, three small white spots just above right foreleg, small black spot on gambrels, broad white over hips to flank, left side, small white spot on tail, left side.

SIRE—Jacob Wit (2662), Jacob 4th (N. H. B. 210), he by Jacob 2d (N. H. B. 56), he by Jacob (N. H. B. 20), he by Rooker, sire of Aaggie (sire). (For extension and milk record see pedigree of Sir Henry 2d of Aaggie attached.)

Jacob Wit's dam, Heiltje (N. H. B. 1006), a very choice, handsome cow.

DAM—Lize, gave as a three-year-old 61 6-5 lbs. of milk in one day. She is large, straight, square and handsome, with superior escutcheon milk veins and good hair and hide.

Bred by P. Stot, Jr., Twisk, North Holland.

Imported by Smiths & Powell, May, 1884.

For further particulars, apply to JOHN MEWHINNEY, POMO, CAL.

Important to Tree Planters.

One hundred and twenty-five thousand Fruit Trees for sale at a bargain, consisting of Apple, Pear, Peach, Apricot, soft and hard-shell Walnuts; also 2000 Fan-Leaf Palms. Sales will be made in lots, or the Nursery and stock will be sold on the most liberal terms as to price and payments, or will be exchanged for real estate. Inquire of J. M. Hixson, Real Estate Agent, 75 N. Spring street, Los Angeles, or address the proprietor, Milton Thomas, P. O. Box 304, Los Angeles, Cal.

ZIMMERMAN Fruit Evaporator.

Read Some of the Testimonials.

I have found the Machine (No. 3) very simple, and it does the work to perfection. Parties who have larger Driers of different makes say they cannot turn out superior fruit (apricots and peaches) to mine.
Vacaville, June 12, 1887. I. W. A. GILMORE.

I found the Machine (No. 2) good, and can truly subscribe to all the merits claimed for it. I have sent apples to Santa Rosa and they sold as first-class.
Laguna, July 15, 1887. W. H. J. AITKEN.

Evaporator came safe to hand (No. 3). Have tried apricots with good success.
Stockton Nursery, July 15, 1887. E. C. CLEWES.

Before writing I wanted to test the Drier also on peaches, apples and pears. Am now doing so with the very best results. Upon the whole, I am greatly pleased with the Drier.
(Rev. Dr.) W. ALEXANDER.
Batavia, July 29, 1887.

I am doing fine work with the Drier (No. 3). I bought it in company with Mr. A. J. Lay, and he, after trying it, takes it all. You can refer to me and I will try to sell more.
C. C. MARTIN.
Glenwood, August 5, 1887.

I have been using a Zimmerman (No. 3) Evaporator on my apricots this season, and cheerfully attest the fact that its performance is fully up to its promise. Its simplicity is such that, although novices, we have succeeded in turning out admirable work, and its economy and facility are quite remarkable.
JAS. PALACHE,
August 9, 1887. (Of Kittle & Co., S. F.)

JAMES LINFORTH, 120 Front St., S. F.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.
Dr. J. KERRIE—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:
Soluble Phosphoric Acid.....12.90 per cent
Reverted Phosphoric Acid......95 "
Insoluble Phosphoric Acid......2.23 "
Potash.....2.23 "
Ammonia.....1.7 "
Nitric Acid.....2.95 "
The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.
This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,
DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.
Dr. J. KERRIE, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

H. M. NEWHALL & CO., Agents, 309 and 311 Sansome St., San Francisco.

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.
In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1/2 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

ORANGE, LEMON & LIME TREES

FOR THE SEASON OF 1888.

Having the exclusive Agency of the Pacific Coast for the extensive Nurseries of A. Wimberly and A. J. Beach & Son, of Palatka, Florida, we are prepared to furnish Orange, Lemon and Lime Trees of all the leading varieties (budded on seedling stocks) in any quantity desired, from one tree to ten thousand,

AT PRICES THAT ALL CAN AFFORD TO PLANT.

These Trees are all first-class, 3 feet and upward in height and three-fourths of an inch and over in diameter at base of bud.

It will be necessary to give your order early to secure prompt delivery. Special prices given for carload lots. Write for prices or any information desired. Address

C. W. REED & CO.,
SACRAMENTO, CAL.

NOTICE.
We import from Japan, where all our stock is raised carefully in our own Nurseries, the best of
JAPANESE AND CHINESE FRUIT TREES
Adapted to California.

Persimmon, Mammoth Chestnut, Plum, Litchi Loquat, the better varieties of Oranges, Kin-Kan, Giant and Dwarf Bamboos, Ornamental Trees, Shrubs and Plants.

We have purchased the Geo. F. Sylvester Seed House, where we will carry in stock all native and foreign seeds and bulbs. We will make a specialty of Japanese Tree, Shrub, Flower, Vegetable and Field Seeds and Lily Bulbs. Send for our new, finely illustrated catalogue.

H. H. BERGER & CO. (Established 1878),
315 and 317 Washington St., San Francisco, Cal.
Address, P. O. Box 1501.

ORANGE TREES! ORANGE TREES!

Also LEMON and LIME, in large or small lots, both wholesale and retail, CHEAPER THAN EVER BEFORE OFFERED IN THIS MARKET, of the best known varieties.
Our Washington Navel was budded to order, with buds from original trees at Riverside. All other varieties selected by personal inspection; possess the highest excellence and great bearing qualities. They are all budded on the famous sour stock, which is hardier, more vigorous, longer lived and superior in every respect to the sweet stock.

We are prepared to take contracts to plant groves of these trees, and guarantee them to grow. We can also furnish Seedlings in any desired quantity, either Sweet or Sour, at VERY LOW RATES.

Place your orders soon, to secure choice trees at the lowest rates. Send for descriptive circular and price list. Address

IMPROVED CHAMPION Cider Mills and Presses.

Three Sizes—Senior, \$40; Medium, \$30;
Junior, \$25.

Best Cider Mill in the World.
Easiest Worked.
Strongest and Will Last Longer than
any other Mill.

The strainer board under the tubs allows a free passage for the cider from the tubs without obstruction of any kind. Our Mills are light, substantial, and handsomely finished.

The very extensive sale we have had for our Mills proves their popularity in all sections of the country, and we will guarantee them to grind as many apples in a given time and produce as much cider from a given quantity of apples as any other hand-power Mill in America, and do it with much less labor than any other Mill on the market.

HOP PRESSES.

Send to us for circular, cuts, and prices of new hand-
power Hop Press possessing the following advantages:

1. Perfect facilities for putting on the cloth, as the
bale, after being pressed, is fully exposed at the sides
and ends.
2. A good depth of box for a hand press (7 feet).
3. A perfectly tight and solid box with no slots or
sliding pieces at the ends.
4. A press that presses downward so that bales come
out at the bottom.
5. Powerful progressive leverage and the entire
absence of cast iron racks (which are always liable to
break and fail to give the required power at the pinch).
6. A balanced follower that goes up without assist-
ance.
7. A press which lets the follower swing entirely out
of the way when up so as to allow of easy feeding, and
which has no overhead beams in the way.
8. Perfect facilities for feeding, the top of the press
being even with the floor, so that the hops can be pushed
or slid into it.

ENGINES AND BOILERS

A SPECIALTY.

Worth's Patent Combined Screw and Tog-
gle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and
Marin Agricultural Fair, Sonoma Agricultural Park As-
sociation, Santa Clara Valley Agricultural Society and
Mechanics' Institute, S. F.

I desire to call the at-
tention of wine and
cider makers to my im-
proved Press. The fol-
lower has a movement
of 264 inches, the first
revolution of the screw
moves the follower 1 1/2
ins., the last revolution
is but 1-16 of an inch,
thereby the power in-
creases in the same
ratio as the resistance.
The platform is 50
inches wide and 10 feet
long; is run back and
forth under the press
on a railroad track.

Has two baskets, by which you can fill the second basket
while the first one is under the press, thereby doing
double the amount of work that can be done on any
screw or lever press in the market that use only one
basket, for this reason: While my press is working con-
tinuously the other kinds are doing nothing during the
time they are emptying and filling their basket.

SOLE PACIFIC COAST AGENTS FOR

THE NEW MODEL GANG.

It is better adapted to all kinds of work and conditions of soil than any other plow in the market. It turns a square corner with ease and in fine shape without raising out of the ground; and has proved itself equal to every emergency, and will do all we claim for it or that could be expected of a plow.

Its economy of operation, ease of handling, lightness of weight and draft, simplicity, durability and cheapness are points which cannot fail to attract attention and convince every wide-awake farmer of its superiority and economy over any other plow ever placed in the market.

In ordinary conditions of soil the NEW MODEL GANG will turn a 24-inch furrow with the same power (three horses) required on a 16-inch hand plow or sulky, a saving of 50 per cent in labor and cost of plowing; in short, the NEW MODEL PLOWS will turn over more land per day, with less expenditure of horse and man power, than any other wheel plow in the market; hence, the NEW MODEL positively is the lightest draft, most economical and best plow to buy.

THE NEW MODEL is no experiment, but has been severely and thoroughly tried throughout the San Joaquin and Sacramento Valleys, and is pronounced by all the lightest draft, the easiest handled and most desirable gang.

The Patent Lever, used on this plow only, insures perfect control and easy management. The wheels are substantial, with wide tires. The Bottoms are the lightest running and best shape made, being much the same as are used on the celebrated Rock Island Plows.

These Gangs are furnished with two, three and four plows, and either 8 or 10-inch cut.

BUGGIES, CARRIAGES, PHAETONS, CARTS, SPRING WAGONS, HARNESS,

Arizona.

The development of Arizona during the last few years has been rapid and considerable. Its advancement in population and in mining industry since the settlement of the Indian difficulties, is promising for the future. The growth of agricultural arts in Central Arizona, the excellent results obtained from irrigation as applied to field crops and orchards, and the inception of other important agricultural enterprises, are all important and timely topics. We are fortunate in securing from Rev. Dr. O. C. Wheeler, who has made a careful study of Central Arizona, its conditions and resources, a series of articles which will present a concise and well-considered statement concerning the region named, which we believe will be very acceptable to our readers. Dr. Wheeler's recognized trustworthiness and ability to intelligently discuss agricultural matters will win for his statement a confidence which would not pertain to an anonymous publication, and his writing will, we doubt not, be of material influence in building up the region which he describes.

Dr. Wheeler will discuss systematically the various matters pertaining to the pursuit of agricultural arts in Central Arizona, and will give sketches of what has already been accomplished. The reader will be introduced to an Arizona very different from the popular conception of the Territory. It will be a district of green fields and flowing waters, of improved fruits and livestock, and his descriptions will be emphasized by views of some of the scenes which he will describe. For the purpose of showing the contrast which we have hinted at, we give on this page a group of scenes in Arizona which are the usual types from which a popular conception of Arizona, arid, sun-bleached and cactus-grown, has been derived. We begin with these views because something very different will be presented in Dr. Wheeler's articles. Taking all together, the reader will be able to discern that there is a picturesque Arizona, with all the characteristic formation and vegetation of a desert, and there is a productive Arizona which is beginning to exhibit all the excellencies of a high development of agricultural arts, and which has a most promising future.

Dwelling for a moment upon the scenes presented in the engravings on this page, the reader's attention is called to the ruin of Casa Grande, the wonderful ruin left to us of the structure by some prehistoric people. Next is the line of the railway among the domes and castellated cliffs which rise from the burning sands, upon which only desert vegetation can exist, and which has for its most striking feature the giant cactus which the engraving shows. At the side a giant cactus is given in enlarged form, while about its base cluster agaves and other forms of desert growth. Another sketch shows the mirage—the horseman beholding what appears to be a chain of mountains mirrored upon the surface of a lake.

ENGLISH FERRETS.—Mr. Hiram Corey of Monterey county, near Salinas City, has been troubled with rodents of various kinds. Last spring he sent to Zanesville, Ohio, and procured a trio of English ferrets, one male and two females, at a cost of \$24, including expressage. His flock has now increased to 17, and he has a

A DAY'S BUDDING.—On Thursday, Aug. 11th, W. B. Holliday of Martinez and his brother George budded 2473 pear stocks in 11 hours. In the afternoon they ran out of scions and cut 800 buds to run them through as they proceeded along the row. They cleaned away the dirt which had been heaped around the stocks by

Agitating for a Division of the State.

With the "land boom" in Southern California there is being revived in that quarter the idle talk about a division of the State. It is a long time now since this question was last agitated, and from the little favor it then met with, there was reason to hope we should hear no more of it. The pretext for a revival of this movement is the alleged diversity of resources, pursuits and interests that exists between the northern and the southern portions of the State—a pretext with very little reason to justify it.

There is not another country in the world covering so many degrees of latitude in which the climatic conditions are so nearly alike and the natural productions so nearly homogeneous as in California. The interests of one section of the State are so nearly identical with those of every other section that California may in this respect be said to be a unity.

Supposing a division of the State agreed upon, where is the line of separation to be drawn? There is a line running east and west across the State, forming the southern boundary of Monterey, Tulare and Inyo counties. This line being straight and avoiding the necessity of dividing any existing county, would naturally suggest itself as being a suitable one to form the northern boundary of the proposed new State. Supposing the latter to consist of the territory here indicated, what sort of a commonwealth would this be, fully one-half of it, all that portion lying east of the San Diego and the Sierra Nevada mountains, being little better than a desert? A sorry State, to be sure, with almost no timber land and not a lake or a navigable river in it!

California, as now constituted, presents a territory regular in its outlines, and vast in dimensions; she being next to Texas, the largest State in the Union. Justly has she been called the Empire State of the Pacific, a distinction her people should be careful not to forfeit by consenting to any proposed act of dismemberment.

The framers of our State Constitution in fixing the boundaries of California builded better than they knew. Left to carve out from the public domain a new commonwealth, they determined not only that it should include a large

area and be symmetrical in form, but that its boundaries should, as far as practicable, consist of natural objects grand and conspicuous. For more than 500 miles the eastern boundary of the State is formed by the crest of the Sierra Nevada, and the Colorado river, than which nothing more suitable could have been adopted. Let us see to it that the lines so fixed by these pioneers be on all sides preserved intact.

FISHERMEN near Antioch are making quite large catches of salmon. The boats average from 20 to 50 fish each, which they sell for 60 cents apiece to the canners.

SOME of the peach-growers about Nevada City get \$400 per acre for their fruit, sold on the trees, this year.

GLIMPSES IN THE DESERT REGIONS OF ARIZONA.

breeding-pen and grounds for them to burrow in. Mr. Corey has experimented with ferrets in hunting rabbits, rats, mice, and squirrels. As domestic hunters they have proved a great success, and he has supplied several of his neighbors with them and made one shipment to Mexico. It is Mr. Corey's idea in utilizing the ferrets to raise a sufficient number and turn them loose in the fields and let them run wild and become squirrel-hunters on their own account. We shall look with interest on his experiment and inform our readers of his success.

THE farmers of Washoe valley will harvest about 75,000 tons of alfalfa this season.

TEHAMA COUNTY has 181,265 acres devoted to prunes and olive trees.

the cultivator. The stocks were planted in March and were all budded to Bartlett. W. B. Holliday cut and set the buds and George tied them. How is this for a day's work? We like to hear about such things from readers of the RURAL.

ALLEGRETTIED FRUIT.—We have had the pleasure of eating plums which had been in Mr. Allegretti's storehouse three weeks, pears five weeks, and peaches four weeks. The fruit was in excellent condition, sound and true flavored. There seems to be no question about the full demonstration of the practical success of his process.

THE fall wool clip will be an exceedingly large one in New Mexico.

HORTICULTURE.

Plums and Prunes.

The State Horticultural Society met in the elegant new rooms of the State Board of Horticulture, at 220 Sutter street, on the afternoon of Aug. 26th, President Hilgard in the chair.

Mrs. H. Berger of San Francisco was proposed for membership, and Messrs. McK. Lennan of Berkeley, E. Steele of Alameda and L. M. Holt of Riverside were elected members.

Leonard Coates of Napa read the following paper on "The Nomenclature of Prunes," and exhibited several varieties of that fruit grown by himself and others.

Mr. Coates' Essay.

The question of prune nomenclature remains at present unsettled. Pomological works describe some 25 distinct varieties. The term "prune" in the English language signifies those varieties of plums that, when dried, are sweet. "Prune" is merely the French way of spelling "plum."

Here lies one source from which errors have sprung, many varieties of plums having been imported to California from Europe, and brought here by foreigners under the French name "prune," while in reality they may not have had the slightest right to the name "prune," viz., a sweet dried fruit, as we understand it here.

For example, take what is commonly called Hungarian prune, and by shippers Gros prune, thereby creating a very erroneous and harmful impression upon the Eastern public as to the individuality of a California prune in a fresh state, for this Hungarian, so-called, is nothing but a large, very showy plum, the other being extremely acid, and, as a dried fruit in any shape, neither profitable nor desirable. The correct name of this fruit, as Mr. Rock has pointed out, is undoubtedly Pond's seedling.

The prune generally cultivated here as French prune, *Petite d'Agen*, Petty prune—I believe to be synonymous with what Downing describes under the name of *Prune d'Agen*, having also seven French synonyms. There is one other variety, described by Downing, called Burgundy prune, which so nearly resembles it that it is doubtless either a seedling or was grown under different conditions, which caused some modifications in its appearance.

I do not see any reasons for disputing the statements made years ago by Mr. West of Stockton after his visit to the prune-growing districts in France. First, that the prune known here as *Petite d'Agen* is the prune of Agen, the term *Petite* having been locally applied to it in California, owing to its small size in comparison with other fruits; and second, that from time to time seedlings have been originated by the peasants, from which have arisen varieties, or sub-varieties, differing slightly from their parent, and yet being so nearly similar that all have been pronounced under the generic name of *Prune d'Agen*.

I wish also to reiterate what I have said on a former occasion, that the French prune is liable to very noticeable outward changes, subject to stock, soil, and the season. I have grafted the same season large trees of apricot, German prune, and almond, with scions of French prune from the same stock, and, in two years, when all were bearing some fruit, the prunes differed very much in size and color. Some were as large as a small Pond's seedling (Hungarian?), showing that by heavy pruning and thinning the French prune will be as large as those that are graded by the French as their largest select fruit, but which are so large that many have thought, and so stated, that they must have been of another variety.

Mr. Gillet of Nevada City is still experimenting with varieties of prunes he is obtaining from France, as I learn from a letter recently received from him, and he would have sent me samples of the fruit from his later importations, but what little fruit he had has been destroyed or injured by a hailstorm.

The expressions Mr. Gillet so often uses are apt to be misleading—"true from the root," "true type," etc.—for there is no doubt whatever in my mind that it is some of the seedlings before alluded to that Mr. Gillet is endeavoring to find.

It is a very common practice among fruitmen in France and Germany to propagate their prune trees by suckers or sprouts from the root. As those produce the same fruit as the tree from which they are taken, of course this tree has never been budded or grafted; or, in other words, is a seedling.

A German in Napa valley has brought over many of these "sprouts," which bear the same fruit as the trees from which they were taken.

I have found trees in Sonoma and Napa counties of the French prune that every year bear larger fruit than the adjoining trees, although stock, soil, age and other conditions were the same. The inference is, that there are in California prune trees which have been propagated from several of these seedling French stocks, but which are hardly distinct enough to constitute a new variety. Yet, if such be the case, they should be distinctly named by the State Horticultural Society and propagated from as rapidly as possible.

I have samples of another prune which I imported from France under the name *Prunier Datte*, and which is identical with the variety

called by Mr. Rock, *Robe de Sergeant*. I have both trees growing and fruiting together.

By reference to Downing, it will be seen that *Robe de Sergeant* is given as a synonym of *Prune d'Agen*, and further, the significance of the term *Robe de Sergeant*, referring to the varied colors in a recruiting sergeant's uniform, is lost entirely if applied to this fruit, which, as will be seen by the sample, is nearly round and of a dark-purplish color, never assuming those varied colors so often seen in the *Prune d'Agen*, or French prune.

I am, therefore, entirely at a loss as to the correct nomenclature of this variety. The wood and habit of growth is very similar to that of the French prune, but the fruit is very distinct.

The prune described by Chas. Downing as *Imperiale de Milan* seems to be identical; it is as follows:

"Tree vigorous, rather spreading, branches smooth. Fruit rather large, roundish oval. Suture broad, extending two-thirds around one side, often enlarged. Skin, deep purple, covered with a thick blue bloom. Stalk, stout, set in a small cavity. Flesh, greenish, juicy, sugary, adheres to the stone. Good. Early September."

At the next meeting I hope to be able to show that there is a marked difference between the Silver prune and Coe's Golden Drop.—LEONARD COATES, Napa.

Prune and Plum Exhibits.

At the close of his essay Mr. Coates called attention to the specimens alluded to in his essay. The fruit from H. L. Gibbs of Calistoga was very large indeed. Some brought by S. H. Shaw of Sonoma were also very large. He showed also specimens varying in size and color according to location, soil, etc.

James Shinn made a fine display of Japan plums of different kinds; also European plums and varieties originated from them. E. H. Rixford showed French prunes. Other fruits shown will be mentioned farther on in the report.

Letter from Felix Gillet.

Edward J. Wickson, Secretary State Horticultural Society.—DEAR SIR: The subject to be discussed at the August meeting of the State Horticultural Society being the "Plum and Prune," I would like to make a few remarks and offer some suggestions, and at the same time correct some wrong notions in regard to the prune industry, which is assuming such immense proportions in our favored State.

First, I would call the attention of our prune-growers to the fact that overconfidence and blowing are more apt to injure than help the development of the prune interest on this coast. "There is no doubt," exclaims exultantly one of our over-enthusiastic prune-growers, "of the superiority of California prunes," and we are yet to grow prunes of the d'Ente or d'Agen variety that would grade 24 to 30, 30 to 35, 35 to 40 to a pound, as the three first grades of that prune do in the d'Ente district of France. Some others, after comparing their own grown and cured prunes with those French imported ones, as we find them in San Francisco stores packed in fancy boxes of one kilogram (2½ pounds), at the very low price of 75 cents per box, came to the conclusion that theirs beat the best-cured French prunes, ignoring the fact that these imported prunes are all of the fourth and fifth grades, or "first grade for exportation."

But on the curing, manipulating and packing of the prune, as done in France, the ignorance of our people is so manifest that I believe it is rendering our prune-growers a service to call their attention to the way the French handle that great product of the southwest of France. The fact is that our fruit-growers should employ more care in picking, curing, grading and packing their prunes if wishing to clean out the French imported goods from the American market, compete with them abroad—in fact, extend the scope of their exports. Of course, duties on imported prunes, as it is wrongly suggested for raisins, might be raised to such figures as to exclude the importation of prunes altogether from this country. This would compel the consumer of the prune in the United States to purchase from us our prunes in whichever way we would put them on the market, but I do not think this is the right way to help and develop this great industry of the Pacific Coast.

French Prune-Driers.

Until Mr. Klee, at a recent meeting of the society, read a translation of Mr. Issartier's paper on the preparation of the prune d'Ente in France, as read before the *Concours Regional* of Agen in May, 1886, almost every one in California had an idea that the French dried their prunes in bread ovens. Better informed people, or those who should be better informed, do or did share in the same delusion. "The fruit-grower in France dries his fruit in an oven sufficiently to keep about two weeks without molding," said Mr. Aiken in an essay on the prune read before the Fruit-Growers' Convention a year ago. Now this is all wrong. It is true that the small fruit-grower, the peasant who owns but a few trees, does put his bread oven to good advantage in drying his little crop of prunes; and a bread oven cannot dry more than 500 kilograms or about 1100 pounds of prunes a season, that is, turn out more than the above quantity in dried prunes. So the large growers who turn out as much as 70,000 pounds of dried prunes (and not half dried as wrongly stated by Mr. Aiken) have to use driers, and indeed have been using them ever since 1837. At the

present time there may be a hundred different patterns of driers in the prune district of the Lot, in France; and it is quite a sight to witness as many as 20 to 24 of those various driers competing every year for premiums at the *Concours Regional* of the great prune centers of the Lot, such as those of Clairac, Montolar, Villeneuve, Bergerac, etc. A *Concours Regional* in France is pretty much like one of our district fairs, with the exception of the holding of horse-races and horse-gambling, which is not allowed there; the *Concours Regional* being simply an agricultural and horticultural competing fair, as its very name, *Concours*, implies. Every year the French are improving on their driers, and in the face of the ever-increasing opposition to their great product from other European prune centers and California, they are striving to turn out a finer article still at cheaper prices and under new forms. My last information from the prune district of the Lot, and I am trying to keep myself well posted on anything going on there in regard to that prune business, of such personal interest to me, is that since the invasion of the phylloxera and the destruction of vineyards in those departments comprising that prune district, and the surrounding departments, too, the grapevines have been taken up by the root, and large quantities of prune trees planted in their place. This is bound to create an overproduction, for which a new market is already sought after. My informant writes to me that many large growers propose to handle their crops in the following manner: Three grades are to be made of all the prunes, the largest ones, from 24 to 50 prunes to a pound, for which there are special rates with always a good demand, will be sold in their bulk to the prune merchants; the second grade, or 55 to 70 per pound, are to be packed in fancy pasteboard boxes with glass covers and sold at 70 cents per box wholesale, and five francs or one dollar retail, the box to be made to contain 2½ kilograms of prunes or 5½ pounds. As to the third grade or *fretin*, or smallest prune, 75 to 110 a pound, they will be worked up in two ways, viz.: Either sold to distillers to be turned into brandy, which is said to be delicious and with as fine an aroma as Cognac, or turned out into preserve or *confiture*, which requires as much sugar as pulp to keep, and put in pots or small glass jars of 500 grams or one pound and two ounces, to be sold at ten cents per pot wholesale. The United States, as usual, is the main objective point for those new or overproducts of the French prune-grower.

The Apricot in France.

Though the apricot is foreign to this prune discussion, I would right here, in speaking of the planting of so many prune trees in France, put a flea in the ears of our apricot-growers and canners. In the valley of the Rhone in France, the home of the apricot there, and where the phylloxera has caused such a ruin among vineyards, immense quantities of apricots are planted in the place of the grapes and "canning" resorted to. Canned apricots from California have already found their way not only to England, but also to France; in the latter country, I suppose, as an object of curiosity. Well, the French did smile at the poor quality of the California article; they are going at it now, but using glass instead of tin, and "putting up" only their very best fruit, keeping the smaller and inferior one for confectionery purposes, to make that delicious "apricot paste" which requires such an enormous quantity of apricots every year. I hope that our apricot-growers and canners will take the hint, if wishing, too, to extend the scope of their exports and put their goods on foreign markets.

How Prunes Should be Handled.

The prune d'Ente should never be picked from the tree, or shaken down, unless perfectly ripe; and never put to dry before being in a withering condition. This is the great secret for obtaining sweet pulpy prunes with a jet black color, as are the best French dried prunes. But here I understand that the fruit is often gathered all at once, ripe or not ripe, and cured in that state of unripeness. This method may be expeditious and cheap, but it is certainly wrong. Let our prune-growers well remember that the beautiful black color of the French prune, its exquisite flavor and pulpy condition, is due above all to the complete maturity of the fruit. In regard to the

Flattening of Prunes.

Which are used on the top of boxes or the sides of glass jars, fingers are no more used for that work. For years the French have been using cylinders coated with a good thickness of India-rubber, which do the work so much quicker and nicer. Pressing prunes in boxes and barrels with the feet has also been done away with; a machine named *Pagueuse* does the work now.

As to the packing in pasteboard boxes, zinc canisters, glass jars, and the like, the prunes, just before packing, are put at a temperature of 120° Centigrade and sealed up tight at once; so packed they will keep years, and may be exported to warm as well as temperate or cold countries.

More than a hundred vessels leave Bordeaux every year loaded with the precious merchandise from the Lot, the chief countries of export being the north of France, Belgium, England, Holland, Germany, Russia, and more particularly the United States.

The prune merchants in Agen and Bordeaux have their own way of preserving and packing the prune, which they keep *secret*, and it is

very hard, unless paying well for it, to get at any of those secret and personal ways of preserving and packing the prune, without having to cook it as hard as a Sacramento valley prune.

Naming Our Prunes.

Before concluding my remarks on this prune subject I would like to make a suggestion to our prune-growers and shippers; it is simply to call by its name our California-grown prune. In fact, why should we call it "French prune"? That is no name at all. In the first place there are several different families of French prunes. I have myself 8 or 10 varieties, blue, red, yellow, all colors and shapes, such as d'Ente, St. Catherine, Perdignon, Dame Aubert, Duriman, etc. I would therefore propose that our "Petite prune d'Agen," more commonly known under the name of "French prune," be called "California prune d'Ente," and that our shippers label it so, for it is a true type of the d'Ente family, and California grown.—FELIX GILLET, Nevada City.

Discussion.

After the reading of the essays on the prune there followed a very interesting discussion, of which we will give an outline in the next RURAL.

SERICULTURE.

The Silk Station at Piedmont.

The Oakland *Enquirer* recently gave an account of the Silk Station work at Piedmont, Alameda county, from which we take these interesting points: The building was put up at the expense of the United States Government three years ago, when Congress made the first appropriation for the encouragement of the silk industry. In this undertaking the Government co-operated with the Ladies' Silk Culture Association of California, and when Congress failed, a year or two afterward, to make an appropriation to continue the work, the ladies took measures to get the property into their own hands. The building, which had cost the United States about \$2000, was sold to them for \$2.50, and at the same time they acquired from the Piedmont Land Company, on easy terms, a title to the tract of land, of 14½ acres, on which the building stands. The affairs of the association are now managed by a Board of Directors of which Dr. Gibbons of Alameda is president and Mrs. Pratt of San Francisco is secretary. Other members of the Board of Directors are Mrs. O. M. Washburn, Mrs. T. H. Hittell, Mrs. Kerr, Mrs. McClellan and Prof. Davidson. Mrs. H. B. Williams is president of the association itself.

Little or nothing was done at the Piedmont station last year, but this spring the association employed Mr. Harford to take charge of the farm, and Mrs. E. R. Spencer, a lady of experience in the rearing of silkworms, has managed the cocoonery. Not much has been done with the latter, however. It was late in the season when operations were commenced, and the building is not properly arranged or ventilated for a cocoonery. There were about 40,000 worms, but leaves to feed them had to be brought daily from Milbrae, and for this and other reasons most of them were not afforded a chance to spin. Not over 15 pounds of cocoons have been made, and the present generation of worms is the last which it will be attempted to rear this year.

The ladies are planning great things for next year. Congressman Morrow succeeded in getting an appropriation of \$5000, which became available July 1st. A new cocoonery will be built. It is proposed to feed 500,000 worms next year, and to do this properly plenty of space will be needed. The new cocoonery will be located in the rear of the existing building. Another building for a reeling establishment is projected, though it may not be put up this year.

Mr. Harford is now clearing a part of the land by cutting down the gum trees and grubbing up the stumps, and a large number of mulberry trees will be planted the coming winter. Five or six acres of land have already been cleared, and there are two or three acres of mulberries, which were planted a year ago. The trees ought to be three years old before their leaves are used; so that if 500,000 worms are reared next season the food for them will have to be brought from a distance.

One of the principal objections to location at Piedmont is the difficulty of getting water, which now has to be brought from a spring at an inconvenient distance. A well is being dug in a hollow on the association's lands, and if a good supply of water is developed, a steam pump will be put in to force a stream into the buildings.

The soil around the silk culture station is shallow and is superimposed upon a stratum of decomposed rock. The roots of the eucalyptus penetrate this rock, and the trees grow thriftily.

Silk Culture.

The State Board of Silk Culture met Saturday, August 20th, President Trumbo in the chair.

A communication was received from the Charitable Mechanics' Association of Boston, Mass., asking that samples of cocoons and reeled silk from this coast be exhibited at the

fair in that city during September. It was voted to send the specimens. A request from F. A. Parker, principal of the High school at Dubuque, for samples with which to illustrate silk culture in the classrooms, was also granted.

The board decided to place on exhibition at the Mechanics' Fair the two beautiful American flags, recently manufactured in New Jersey from California silk, together with the costly reeling machine just imported.

The mulberry trees lately planted at Brentwood, Contra Costa county, were reported to be in good condition and likely to be ready for distribution after the early rains.

A letter had been received from Y. Kadoi, special agent of the Japanese Department of Agriculture, thanking the board for the annual report and congratulating them on their success in promoting sericulture.

THE VINEYARD.

Vintage Work and Instruction in the Viticultural Laboratory, 1887.

University Experiment Station. Bulletin No. 74.

The vintage work in the Viticultural Laboratory of the University will be resumed during the first week of September next, substantially on the plan pursued during previous years, but with facilities greatly enlarged and improved. The general features of this work are outlined in the legislative Act of 1880, which is here given for the information of persons interested:

The Provisions of the Act of 1880.

An Act for the Promotion of the Viticultural Interests of the State. (Approved April 15, 1880. Stats. of Cal., 1880, p. 53.)

SECTION 8. And for the further promotion of viticultural interests, it shall be the duty of the Board of Regents of the University of California to provide for special instruction to be given by the Agricultural Department of the University, in the arts and sciences pertaining to viticulture, the theory and practice of fermentation, distillation and rectification, and the management of cellars, to be illustrated by practical experiments with appropriate apparatus; also, to direct the Professor of Agriculture, or his assistant, to make personal examinations and reports upon the different sections of the State adapted to viticulture; to examine and report upon the woods of the State procurable for cooverture, and the best methods of treating the same; and to make analyses of soils, wines, brandies and grapes, at the proper request of citizens of the State; also, to prepare comprehensive analyses of the various wines and spirits produced from grapes, showing their alcoholic strength and other properties, and especially any deleterious adulterations that may be discovered. The Regents shall also cause to be prepared, printed and distributed to the public, quarterly reports of the professor in charge of this work, relating to experiments undertaken, scientific discoveries, the progress and treatment of the phylloxera and other diseases of the vine, and such other useful information as may be given for the better instruction of viticulturists.

Under the provisions of this Act, work has been carried on at the University since its passage, so far as the funds available for the purpose permitted. For some time it was severely restricted by the want of proper appliances and working force. The larger scale and ampler means with which the experimental and illustrative work can now be carried on, render the methods and results more directly applicable to the work of wineries.

The plan and character of the work in the viticultural laboratory has been so fully and repeatedly set forth in the bulletins and reports of the College of Agriculture as to render a reiteration in this place unnecessary. Apart from its use in actual instruction, the experimental work is intended to secure "a definite knowledge of the qualities of each of the prominent grape varieties, and of their influence upon the kind and quality of the wine, in blending before, or as the case may be, after fermentation; of the treatment required by each in the cellar, during the time of maturing; and finally, of the differences caused by difference of location, climate, etc., as well as by different treatment of the wines themselves during the first and after-fermentation."

The Experimental Vineyards, established under the auspices of the University by public-spirited citizens, will this season supply a largely increased material for such work. But grape-growers and wine-makers all over the State are invited to send sample lots of grapes for analysis and experimental wine-making. As a rule, each variety will be made into wine separately; the analysis of the must is made on the day of crushing, and will, if so desired, be at once communicated to the sender. That of the wine must, of course, be delayed until the latter has acquired a reasonable degree of maturity, after several rackings. But reports on special points that may be ascertained sooner will be sent if desired.

Experimental blends will also be made either in accordance with the request of growers, or such as examination or previous experience may seem to render desirable.

It is hardly necessary to say that, other things being equal, the larger the quantity of grapes worked, the more certainly and nearly will the result correspond to that which may be expected on the large scale. In the case of rare grapes, a few pounds, carefully treated, may be made to give fair results; but it is very desirable that the amount sent for experimental working should in no case be less than that which will

yield five gallons of finished wine—say (considering the losses consequent from transportation, amounts required for analysis, frequent racking, etc.) 100 pounds; but twice that amount is preferable. And larger consignments, sufficient to test the merits of various modes of fermentation with one and the same grape, will be welcome.

The prominent characteristics of any locality or variety, as to the production of sugar or alcohol, acid, tannin, body and color, are, of course, identically shown by small as well as large-scale samples; and these, the natural possibilities of each variety, soil and locality, are what our experiments primarily aim to determine. Wines made in 5-gallon packages develop differently from those made in 1000-gallon tanks; but the difference does not go so far as to prevent the accurate reproduction of the characteristic bouquets. A competent wine-maker will know how to make allowance for the unavoidable differences, and can come to a close estimate of the outcome on the large scale, from samples made on a small scale, for the government of his winery work.

The comparison of the effects of different methods of fermentation upon wines made from one and the same grape, made last season, and described in the report for 1886, have furnished important indications for large-scale practice, in more than one point of view. These experiments, with others of a similar nature, will be repeated during the present vintage.

It will be readily understood, from the methods and objects pursued, that the University laboratory does not aim to produce crack wines, for comparison with the products of the wineries, but rather samples that are to be distinctly studied and judged in connection with the conditions of their production.

Course of Instruction in Vinification and Wine Analysis.

Students taking this course will, during the vintage season, occupy the greater part of their time in actual work in the viticultural laboratory, under the direct instruction of Assistants Jaffa and Colby. In addition, from two to four lectures on the principles and practice of vinification and wine analysis will be given them by Professor Hilgard.

It is very desirable that students taking this course should have some general knowledge, at least, of chemistry and physics; and some preliminary experience in winery practice will be very advantageous.

Applications for this course should be addressed as soon as possible to Prof. Hilgard, at Berkeley, in order that the proper laboratory arrangements may be made before the brunt of the vintage comes. The lecture course will begin at the opening of the University session, September 23d, but, according to the season, the laboratory work may begin sooner, and students applying will be promptly notified of the fact. Instruction is gratuitous, but a charge, varying according to actual breakage of apparatus and use of chemicals, from a minimum of one dollar per month upward, is made to laboratory students.

Suggestions to Senders of Grapes, Wines, Etc.

Wine grapes, being usually very juicy and of delicate texture, should be packed with especial care, either in "basket crates" or in small, shallow boxes holding not exceeding 20 pounds each, and preferably in layers with grape leaves between. In no case should packing paper be used, as it causes a rapid production of mould, spoiling both the grapes and the experiment. Persons not having proper boxes may have them sent to them by express from the laboratory by giving timely notice. Basket crates, such as are used in the shipment of table grapes to the East, are in every respect the best package and are exclusively used in the shipment of grapes from the University experiment stations.

Crates and boxes should be carefully labeled or marked with the name of the grape and of the sender, on at least one of the sides, and not on the top or bottom, where almost any mark will soon be obliterated in handling. In addition, a label plainly written with lead-pencil should be placed inside on top of each package.

As a safeguard against erroneous or indefinite designations of varieties, it is specially requested that a good cane, representative of the variety, with leaves and all, be placed in at least one of the packages representing one variety. Any peculiarities occurring in the production of the samples sent should be mentioned in detail in the letter of advice.

Ready-made wines or brandies of which the analysis or other examination is desired will receive attention in the order of their receipt at Berkeley.

All work is, of course, done gratuitously, transportation charges being ordinarily paid by the sender.

Send promptly advice of shipment, whether by express or freight. Address University of California, care of Prof. Hilgard; if by express, to Berkeley; if by freight, to West Berkeley depot.

The Choice of Resistant Stocks.

In the report of viticultural work for 1886, I have discussed to some extent the special adaptations of the several resistant stocks now most commonly relied on in California, and have called special attention to the disproportion between the growth of the *Riparia* and *Rupestris* on the one hand and the quicker-growing *Vinifera* grafts on the other. As few subjects are

of greater importance to some portions of California than the establishment of the new vineyards upon properly adapted resistant stock, I desire at this time to call the attention of those who have used such stocks to some points which have come under my immediate observation, and which, if verified as of general occurrence, deserve the most earnest attention of persons concerned. It is partly with a view to eliciting the experience of others in the premises that this publication is now made.

There is no reason to expect that the grapevine should not stand as much in need of a careful selection of grafting-stock adapted to both the graft and the soil, as do the orchard fruits. The plum is not more different from the peach and almond than the several species of wild vines are from one another, and from the European vine, both in adaptation to soils and habit of growth. When such adaptations are not considered in making a choice of resistant stocks, it must be expected that the penalty will have to be paid, whether in the unproductiveness or early death of the vines.

It has for some years been said by several eminent French vineyard experts that the wild vines, and among them especially the *Riparia*, is not well adapted to the *Vinifera* graft, and tends to shorten the life of the vine constituted by their aid. In connection with this come occasional reports that even the *Riparia* does not resist the phylloxera.

From the personal experience and other facts now before me, I have little doubt that most if not all of these adverse reports are due to the want of co-adaptation above referred to. There can be no question that the wild *Riparia* fully resists the phylloxera, for otherwise it would long ago, with the rest of the wild vines of the East, have been eradicated. When therefore it succumbs to the attack when used as a grafting stock, it must be because its vitality is too heavily drawn upon by other causes. Such a cause may well be found in the imposition upon it of a graft whose growth exceeds several times that of the stock, and thus naturally tends to exhaust the latter. I have before me junctions of *Riparia* with *Clairette*, *Blanche* and *Palomino*, looking like a claret bottle turned upside down; the same with *Rupestris* as the stock, is still worse. In others, in which the slow-growing *Barbera* forms the graft, the joint is almost cylindrical. It can hardly be doubtful that under ordinary conditions, the latter will far outlive the former. On the other hand, grafts of the same varieties on *Californica* show, in the case of the *Clairette* and *Palomino*, almost exact equality of the graft and stock; while the junction of *Barbera* with *Californica* looks like the claret bottle right side up, the stock far exceeding the graft.

But the influence exerted upon the growth and bearing qualities of the grafts is not less remarkable. In all cases the (2d year) *Riparia* grafts bear the heaviest crop, exceeding the average of the *Californica* (similarly short-pruned) nearly two to one. The wood growth is also quite different, being much stouter and more copious on the *Californica* stock than on the *Riparia* and *Rupestris*. The last named, however, is also deficient in crop.

The superabundant bearing of the *Riparia* seems to be quite analogous to that of the branch of a fruit tree which has been severely bent or girdled to check the sap and thus to promote fruiting; and like the latter, it is likely to cause the vine to be proportionately short-lived, and less likely to resist unfavorable influences (e. g., the phylloxera) that it might have easily overcome had it not been overtaxed. Some, however, may prefer even for their vines "a short life and a merry one," with heavy crops.

On the other hand, the *Riparia* seems to be a proper stock for such vines as the delicate *Barbera*, which on the *Californica* stock has made an enormous amount of wood but very little fruit.

Again, in a soil better adapted to the *Riparia* and *Rupestris* than is the calcareous clay soil of my vineyard, the outcome might be different, and less favorable to the *Californica*. However, upon inquiry made by me at the late meeting of the Grape-growers' Association, Messrs. J. H. Wheeler and Clarence Wetmore reported very nearly the same experience from their Livermore vineyards, which have very different soils.

The subject is too complex to be fully considered here; but I desire to call the earnest attention of those having the opportunity for observation to the importance of this subject, and request them to communicate to me the facts noted.

E. W. HILGARD.

Berkeley, Aug. 26, 1887.

A LARGE PLANK.—The Humboldt Standard describes a sample plank which the editor saw at John Vance's mill, and which was about to be shipped to Kansas City. This plank was 65 inches wide, 16 feet long and 3 inches thick. There is not a blemish in the piece, and it is a fair sample of the lumber cut from Mr. Vance's Mad River woods. It is the intention to exhibit this specimen plank at the exposition to take place in Kansas City this fall.

THE WOOL CLIP OF COLORADO this year exceeds by a million pounds the clip of any previous season, and the great bulk of this wool finds a market in Chicago. Formerly it was shipped to Boston and Philadelphia, but the tables have turned, and Chicago enterprise is fixing this point as the great future wool market of the country.

THE STOCK YARD.

Mad Itch.

EDITORS PRESS:—The Cottonwood Index says that some gentleman terms a certain disease in cows the "mad itch;" this name for the ailment is misleading. Itch or mange produces much irritation or "itching," but not sufficient to make the animal apparently mad. Mange is due to an insect burrowing under the three layers which go to make up the skin. But this disease seldom, if ever, causes death. The cows in question "acted strangely, rubbing their heads violently against the fence; they continued this for several hours and after rubbing and beating their heads and necks into a pulp, died." Probably it is due, as Mr. Addison says, to eating quids of cornstalks left by hogs after chewing and extracting the juice. If it is due to this cause it might have produced intense pain, ultimately causing inflammation of the stomach and bowels, the brain then sympathizing, and the animal dying exhibiting much excitement.—ROBERT J. DAWSON, Veterinary Surgeon, 225 Geary St., S. F.

We give below the full account to which Dr. Dawson alludes. Mad itch is, as he says, misleading, as it leads one to infer that the real seat of the trouble is in the head, whereas the real trouble is inflammation of the stomach from the presence of indigestible material. We have often warned our readers not to allow cattle to feed on hog leavings. The danger has been shown by disastrous results of the practice in the prairie States and on this coast. The following is the account referred to:

John Reno informs us that on the 18th inst. two valuable milk cows belonging to Reno Bros. died rather suddenly. He noticed them in the morning acting strangely, rubbing their heads violently against the fence. They continued this for several hours, and, after rubbing and beating their heads and necks into a pulp, died. Mr. Addison gives it as his opinion that the disease of which they died is the "mad itch," and that it is induced by eating quids of cornstalks left by hogs after chewing and extracting the juice. Others affirm the correctness of Mr. Addison's theory from positive evidence. At all events, it is well enough to provide against losing cows in this way.

Notes on Breeding.

G. M. D. of Sacramento writes to the *Sagebrush Stockman* as follows: An article published in your journal last week urges that only pure-bred sires should be used by our horse and cattle-breeders, and affirms that no improvement can be made in our stock by using grade sires.

I agree with your statement that where circumstances of location and pecuniary ability will permit of securing the services of pure-bred sires, none other should be used; but I am confident you are putting it too strongly when you state that grade sires will not improve our common stock.

If a cattleman has a band of common cows, and desires to improve them by introducing the blood on some fixed breed of improved cattle, he should aim to introduce as much of that blood as he can consistently in a given time, and if his band is large and he cannot afford to purchase a sufficient number of pure-blood sires of the breed desired, he acts wisely if he secures fifteen-sixteenths, or seven-eighths, or three-quarters, or even one-half bloods. The higher the grade the better, of course. And experience demonstrates that either grade will give far better results in his herd than can be secured by using only common scrub bulls on a par with the cows.

There are not enough thoroughbred bulls in the United States to-day to serve the breeding cows on the vast ranges, and I submit that it is far better, if you cannot secure the thoroughbred, to secure and use the highest grade you can. The same is true of horses. There are many grade sires in the country which are doing splendid service in improving our horses. Would it not be poor practice to discard these and use a common scrub sire when unable to secure the use of a thoroughbred?

I observe that many of our intelligent cattle-men prefer high-grade bulls to pure-bloods, claiming that they are far more hardy, and thus do better on the range. This is doubtless true as regards some breeds that have been inbred and highly pampered for generations. But breeders of our more modern breeds of improved cattle that are becoming justly popular claim it is not true when the pure-blooded animal is not forced and pampered in raising.

In breeding stock the stockman should fix in his mind an idea of the animal he wishes to produce, then select his sires from the breed coming nearest to that idea, and get as much of that blood into his herd as he can in a given time.

There is altogether too much haphazard, go-as-you-please, trust-to-luck method, or rather lack of method, in stock-breeding. The man who will win in the end is the one who fixes an ideal and then breeds for it slowly, earnestly and surely.

THERE are now about 1000 men at work in the woods and mills between Arcata and the north fork of Mad river.

PATRONS OF HUSBANDRY

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

The Anti-Debris Association.

The annual meeting of the Anti-Debris Association of the Sacramento valley was held at Yuba City, Saturday, Aug. 27th. The following Board of Directors was chosen: C. E. Stone, G. W. Hutchins, T. B. Hall, B. F. Walton, N. D. Coombs, Geo. W. Carpenter (Treas.).

Resolutions were passed thanking C. E. Sexey, the retiring president; also recommending that Geo. Ohleyer remain the manager.

The report of the latter referred to the long-continued delay of U. S. District Attorney Carey to bring suit against the hydraulic miners under the anti-debris clause of the last river and harbor Act as very exasperating. The report set forth that no hydraulic mining injurious to other interests is now prosecuted except in contempt of the State or Federal courts. A few mines are still running when not watched, and the association is making strenuous efforts to bring such offenders to justice, but the miners have the locality so well guarded by wires and sentinels as to make it very difficult to get them into court. The question of offering a reward for information to convict was left to the new Board of Directors. The report recommends that a committee, or a party of interested persons, spend all or a part of September in the mountains, visit every hydraulic mine upon the Yuba, Bear and Feather rivers and report their condition. Mr. Ohleyer says that no violation of the anti-debris injunction should be permitted during the coming winter and spring. This measure would, in his judgment, prevent all controversy and litigation; and this can only be accomplished by having sufficient men on the ground, either employed by the association or by the State and Federal Governments, to prevent the use of monitors. The report congratulates the association on the great work it has accomplished in the virtual extinction of hydraulic mining, and commends the president, C. E. Sexey, for his long years of valuable service in that office without fee or reward.

It was stated that the financial condition of the association is such that the money due from the Milton hydraulic mine for fines imposed for contempt would more than pay all the indebtedness. The association recently divided between Yuba and Sutter counties over \$2200 collected from fines imposed upon the North Bloomfield Mining Company.

The meeting was harmonious, and the utmost determination was shown to complete the work of suppressing the debris evil.

Review of the Anti-Debris Struggle.

The *Sutter Farmer* last week contained an historic sketch of the war against the debris evil—presumably from the pen of Hon. Geo. Ohleyer—the larger portion of which we lay before our readers, as follows:

From what is now too plain to be mistaken and too well known to be gainsaid, the agitation against the mass of earth set loose by the monitor was not begun a day too soon. In fact it should never have been permitted, and no doubt never would have been, had its far-reaching consequences been seen from the beginning. The early practice of California mining practically gave the State to the miner to use as he desired; but it was not law, and among the first laws promulgated in the camp of the miner was that every miner should so conduct his operations as not to interfere with the rights of his neighbor.

When the agriculturist desired the same protection he was treated with scorn and derision, and was told that he held his possessions subject to the superior rights of the men in the mountains. These were so confident of their position that they hailed the beginning of suits with apparent satisfaction, and promised to abide by the decision. The Keyes suit, the pioneer onslaught, was not decided, but turned out of court on a technicality, and as since decided, erroneously.

In subsequent complaints we were told that the filling of the rivers was a benefit and the sand on our farms a fertilizer, and that they had prescriptive rights anyway, which were confirmed to them by our acts in constructing levees, etc.

Thus the levee ground was traversed, step by step, and when nothing more could be said in defense of the little giant, the case was submitted with the understanding that the decision should settle the issue and restore tranquility to the people of both sections. The decision came; it was the most searching and exhaustive ever produced on the Pacific Coast. It was so thorough and just, and so well grounded in law and equity, that it was not appealed, two years' probation failing to reveal a flaw in it on which the defendants dared ask for a reversal.

By their (defendants') consent the decision stands as the law of the land, and all infractors could see the "handwriting on the wall" in plain English. No stronger or better notice to quit could have been given; but instead of doing so, of carrying out the implied pledge of submission to law, they at once sought methods to accomplish indirectly what the courts had forbidden. What was formerly lawful by toleration only was now illegal and done in con-

tempt of court, whose mandates had no effect whatever on the late honor-protesting hydraulic miner.

What was before surmised became a certainty, and that was the intention of continuing in spite of the courts and the plaintiff, and that if the plaintiff hoped to get the relief given him on paper, he must enter the rebellious territory and enforce the courts' decrees. This marks an area in the struggle wholly different from that of the past. The fight on the part of the defendant descended to abuse of the victors; nothing too mean and untruthful could be said of him; but it was not confined to those seeking the protection of the Government—it was leveled against all the courts with equal ferocity. The agents of the valley counties and those of the bays as well, were abused as the veriest scoundrels, for the sole purpose of destroying their standing and to discourage appropriations and pursuit. Their acts have stood the test of every investigation, and their desire for rest and relief has always been met with refusals by the people and those in authority. We could forgive the old and honest press of the mountaineers; they are entitled to respect on the ground of the cherished ideas so long in the ascendant there, and we believe they will be the first to see the error of their theories.

The most deplorable story of this whole struggle remains to be told. We refer to the depth of infamy into which the hydraulic vandals have plunged a few editors. It must be stated that no respectable journal, either city or country, of any size or pretensions, is devoting space to this inhuman warfare. This is left to the scout and adventurer. Some of them are bold and barefaced; others wear the mask of pretended friendship toward a tax-ridden people. The first abuse the valley agents because 75 per cent of hydraulic mining has been stamped out beyond recovery; the latter because 25 per cent continues to defy the laws of the land with every opportunity. This class of papers have never a kind and encouraging word for the plaintiff in his numerous victories, and never a word of censure against the lawless. Both know that the hydraulic vandal is responsible for the presence of the hated "spy" and the irritation and expense engendered by his acts; and both know that a full and complete surrender to the law and decrees would stop every act and pursuit and prosecution in a day. Among the many silly mistakes of the hydraulic crowd, the worst is maintaining journals in the valley whose hostile criticisms are quoted for the purpose of showing a change of public sentiment. While it deceives no one, it serves to show to what depths a bad cause may descend, and to prolong and intensify a struggle that can end only by complete submission.

It Fills the Bill.

It is reasonable to suppose that every farmer desires to better his condition, relieve himself of burdens that are unjustly saddled upon him, and realize something from his labor. This result he ought to attain, and we believe would achieve, if the work was gone about in the right way, in the proper spirit and with that determination which knows no let-up until the objects aimed at are accomplished.

Let us look at this matter dispassionately for a few moments. Here is a body of men embracing slightly over one-half of the voting population of the country, engaged in a common calling, with an identity of interests and a oneness of purpose that ought to unite them indissolubly in some movement for their welfare. But are they united? Do they work together for the attainment of a common end? What is needed is thorough organization and intelligent direction. How is it to be had?

The farmers' club, though very good in itself, is far from meeting the requirements of the hour. Discussing the succession of crops, the raising of stock and the application of fertilizers—all important topics, we concede, but not the real subject at issue—consume the time of the club. The farmers' institute, one of the best places in the world for airing pet theories and riding darling hobbies, also leaves the vital question unsolved. We must look somewhere else for relief, and there is only one source of help left. The Grange fills the bill, if that form of expression is admissible, and to its standard let the farmers gather from every nook and corner of our broad land. Bury all partisan differences; turn your backs upon party leaders; think, act and vote for your own interests, and you can secure all you desire. Dissensions among farmers themselves render spoliation possible and profitable.—*Virginia Granger*.

JERSEY PATRONS ON A PICNIC.—Eastern Grangers appear to be well abreast of their Pacific kindred in the way of pleasant and profitable outdoor gatherings. A correspondent of the *Farmers' Friend* tells how the Patrons of Burlington county, N. J., held their regular annual picnic under the auspices of Pomona Grange, in the Old Camp woods, near Vincentown, Saturday, Aug. 6th. The committee had made careful and complete arrangements, and, excepting the showers of the afternoon, everything passed off in the most pleasant manner possible. The dinner covered several long tables, and was a complete success. Every Grange in the county was represented, and there were beside visitors from five other counties of the State. With organ accompaniment, a large choir of young folks rendered

some excellent Grange songs. Among the speakers were Richmond Coles and Mortimer Whitehead, Master and Lecturer of the State Grange; Judge Buchanan, Congressman of the district, who is not ashamed to face his constituents because of his work, and votes for the oleomargarine and other laws in the interest of all farmers, and Bro. Applegate of the State Grange Legislative committee. Bro. D. T. Haines acted as chairman and made the address of welcome. The rain interfered with the speaking, but there was plenty of Grange literature for distribution, and so the good seed was sown and the crop cultivated.

"GRANGE WORK AND PROGRESS."—Owing, as we suppose, to some delay in the mails, the wanted favor of National Lecturer Whitehead has failed to reach us the present week.

AGRICULTURAL NOTES.

CALIFORNIA.

Amador.

GETTING READY FOR THE FAIR.—*Record-Union*, Aug. 29: Plans were adopted and contracts let on Saturday for building the Pavilion at Ione, for the Agricultural District comprising El Dorado and Calaveras counties. It will be 60x100 feet, and the walls made of concrete, thus rendering the structure nearly fire-proof. The contract for construction was let to C. W. Swain of Ione, and the mill work will be done by Pearson, Amsden & Burnett of Sacramento. The building will cost about \$3500, and is to be completed in time for the fair, which is to open Oct. 3.

Butte.

ITEMS FROM GRIDLEY.—*Cor. Record Union*, Aug. 25: The last of the wheat bought on contract was forwarded to S. F. to-day. Farmers are now busy hauling their grain and storing it in warehouses, expecting better prices. Some 4000 tons are now stored in the Gridley warehouse. We will also have about 10,000 sacks of as fine corn as was ever raised in the State for market. We have about 30 acres of vines in this section, all loaded with choice raisin grapes. The 700 orange trees set out by A. W. Campbell last spring are growing nicely; also those planted in town. The yield of wheat hereabout has averaged 10 sacks to the acre, and barley 13.

El Dorado.

FRUIT NOTES.—*Placerville Observer*, Aug. 23: S. D. Colburn, who has a fruit ranch at Kelsey, 2200 feet above the level of the sea, was in town Saturday arranging for the shipment of his peach crop. And such peaches! For his Strawberry Clings he uses six-inch boxes, and finds it necessary to use a half-inch cleat on the ends to admit of two tiers.... While passing through Hardie's orchard last week, Dr. Wrenn picked a Diamond Cling peach of more than ordinary size, brought it to town, and found that it weighed a plump pound. Pretty good peach to grow on land that cannot be irrigated.... W. H. Whitbeck was in town Saturday with a few Lyon seedling peaches, as handsomely colored as any we have ever seen, and large enough to attract attention in any market. Mr. Whitbeck has named his place Fairview ranch, because of the fact that, standing in his doorway when the weather is fair, one gets a view of the entire Sacramento valley, including the State Capitol and Insane Asylum at Stockton. But a few years ago this ranch was as rough and densely covered with chaparral as any land in the county. Off three rows of blackberry vines, 80 feet long, he has picked this season 510 quarts of berries, and today one would hardly believe any had been picked. His land has an elevation of 3000 feet above sea level.

Kern.

PEACH CROPS SOLD.—Telegram from Bakersfield, Aug. 24: The agent of a Sacramento fruit company purchased to-day the crop of two peach orchards in this vicinity, paying two cts. per pound. The owners will net at that rate \$400 an acre. They are to be shipped to Chicago. The purchaser states that the fruit is the finest he has ever seen in the State.

Los Angeles.

NORWALK ENTERPRISE.—*Cor. Colusa Sun*: I lately visited the little town of Norwalk. They have just put up a fruit-drier, and hope to make a large crop of raisins this fall, which will be much more commendable than making wine. Between Norwalk and Artesia they have set out a great number of eucalyptus. As this grows in a few years to be a tall, stately tree, yielding a large amount of fuel, it is thought it will prove remunerative. We are by no means confined to raising lemons, oranges, or even grapes. Apples, peaches, nectarines are now in order. Apricots bore well this summer, and have already been disposed of.

Marin.

CHOICE FRUIT.—*Journal*, Aug. 25: The fruit production in San Rafael is something marvelous in its way. Nearly all the fruit raised is in private yards or house grounds, and in nearly every instance the produce here is superior in quality to any in the market from abroad. We have most delicious apples, pears, peaches, plums, grapes and berries, yet we have no orchards. Oranges, equal in flavor to any grown south, are raised here, and our grapes are said by connoisseurs to equal in quality those of the south of France. Yet our capacity for these products is not generally known.... Some of

the finest egg plums that ever grew may be seen on Judge Mahon's grounds. They are turkey egg plums and very delicate in flavor.

Nevada.

MELONS ON DEBRIS.—*Grass Valley Tidings*: We are indebted to Mr. Nichols, the dairyman whose place is two miles west of town, for a sample watermelon grown by him on pure, unadulterated slickens and without irrigation. The melon was sound, sweet, and of just the right consistency—as edible as the best we have ever partaken of. Mr. Cassaway, who is connected with the dairy, tells us that there is about half an acre of these melons, and that some of them will tip the scales at 60 pounds. The slickens was undoubtedly soft, thus allowing the tap root of the vine to penetrate deep and derive sufficient moisture. Four-pound egg-plants are also grown on this same slickens.

Placer.

IRRIGATING TOMATOES.—*Auburn Republican*, Aug. 24: H. B. Gaylord, who is a practical gardener, says there are some varieties which need water and fill well when it is used liberally. Such varieties are the Essex and the Cardinal. Other varieties, such as Turner's Hybrid, will grow large but slice up into "cart-wheels."

Sacramento.

THE HOP HARVEST.—*Bee*, Aug. 24: Hop-picking was begun at Menke's ranches yesterday. Over 400 persons are engaged in the work. A very large proportion are Chinese, as the man who promised to open a boarding-house for whites failed to keep his word. The hops are of fine quality, and Mr. Menke states that his force can pick 60,000 pounds a day. Three Chinamen yesterday picked 826 pounds. The price paid is 95 cents per 100 lbs.

SEEDLING CLINGSTONE.—*Record-Union*, Aug. 29: On Saturday Adolph Jean of Mayhew Station brought to this office samples of a seedling clingstone peach raised by him which is second to none in the market. It is evidently from an orange-cling pit, and nearly true to the tree from which it came. This seedling may be of a little redder marking and flesh, but it is hardly distinguishable from the orange-cling either in appearance or flavor, and in size ranks with the best. Some of the samples measure over 12 inches in circumference and weigh a pound. The tree upon which they grew is three years old, and bore this year five boxes of this mammoth fruit.

San Bernardino.

ARTESIAN WELL AT CUCAMONGA.—*Ontario Record*: An attempt to find artesian water on the Fruit Land Company's land was crowned with success Friday, August 19th, when Mr. H. Griggs, the well-borer in charge, struck a fine stream at a depth of 220 feet. The water is clear as crystal and six degrees cooler than the cool stream flowing from tunnel No. 1. This fact suggests different sources for the two streams. The flow began with about two miner's inches. It has been increasing steadily up to this (Monday) morning, when the flow is 15 inches strong over the top of the pipe, two feet above ground. The different strata passed through in sinking the well were as follows: First, 50 ft., gravel and boulders; thence to 70 ft., hard cement and boulders; thence to 90 ft., coarse gravel; thence to 150 ft., cemented boulders—very hard; thence to 158 ft., clay; thence to 210 ft., cemented boulders—very hard; thence to 220 ft., coarse gravel full of water through the entire stratum, when fine compact sand was struck and work ceased.

San Diego.

OFF NON-IRRIGATED VINES.—*National City Record*: The finest sample of grapes brought in this year are from Geo. L. Kimball's ranch, and may be seen in our window. There are three varieties, Rose of Peru, Flaming Tokay and Muscat. Mr. Kimball never irrigates, and always raised the best and most highly flavored grapes brought to this market.

FLAXSEED BY THE CARLOAD.—*San Diego telegram*, Aug. 30: Twenty thousand pounds of flaxseed arrived from Fallbrook yesterday. The seed will be sent to the oilworks in San Francisco.

San Joaquin.

TESTING A GRAIN-CLEANER.—*Stockton Independent*, Aug. 28: A thorough test of the Angle Sieve grain-cleaner was made on Hunter-street square yesterday in presence of a large crowd. The wheat operated upon was mixed with oats and barley, and the result proved conclusively that the machine was able to do all that is claimed for it. Several experienced farmers who witnessed the test said that the Angle Sieve was the best cleaner and separator of wheat they had ever seen. The machine is manufactured at the Stockton Combined Harvester and Agricultural Works.

CROPS ABOUT ATLANTA.—The grain is garnered and the farmer has learned how much has been the reward for his toil. The average exceeded the expectation, summer-fallow in many cases yielding 26 bushels to the acre and winter-sown grain from 8 to 15 bushels per acre. Those who sold early felt very well pleased, but those who still have wheat to sell are rather more quiet.

San Luis Obispo.

A GRANGER AT PASO ROBLES.—*Leader*, Aug. 27: Hon. J. V. Webster of Creston was in town last week and took a look around to see what the prospect for fruit-growing was here. He paid a visit to the hotel orchard on the river-bank, and, like every one else who sees

that remarkable feature of our development, was astonished. The peaches he pronounced equal to anything he had ever seen, and the nectarines superior to any that had met his notice elsewhere in the State. In size, beauty of color and exquisite delicacy of taste they are simply incomparable. But, while the excellence of the fruit grown on the river-bottom amply demonstrates the adaptability of that soil to fruit-growing, Mr. Webster gave it as his opinion that the mesa and hill lands were even more desirable for horticultural purposes, and this opinion is coincided with by those who have made the matter a study.

Santa Barbara.

LOMPOC DOTS.—*Record*, Aug. 20: We wish that all who have any notion of coming to Lompoc could at this time visit the numerous young orchards all over the valley and see the wealth of fruit of every variety with which the trees are laden, and also how free from every kind of fruit pest these orchards are. There is not a codlin moth in this region. Then the scale, which is such a pest to the pear, leaves our fruit smooth and clean. The Early Crawford peach crop in the valley is very large, the fruit is of superior quality and fast ripening.... F. Legee has just thrashed a piece of mustard that had but half an inch of rain after being sown, and it yields 22 sacks per acre. Mustard will be worth about three cents per lb., or \$66 per acre.... Wm. Cantley estimated that he would have about 1400 sacks of barley on his ranch in the valley; but instead he had over 2700, and this is but a sample of the increased yield of grain the present season in Lompoc valley.

Shasta.

FROM FALL RIVER MILLS.—*Cor. Redding Democrat*, Aug. 22: Heading is about completed and the whistle of the steam thrasher is for the first time heard in the valley. Grain is of fair quality, but the yield is light owing to dry weather and the late frosts. The fruit crop is a failure, and the vegetable crop is late and of only medium quality. The farmers, however, are far from being discouraged, as there is no case of an entire failure of crops in the valley.

Solano.

PAYING PEAR TREES.—*Suisun Republican*: L. B. Abernathie of Suisun valley has a little less than one acre of Bartlett pear trees planted out very irregularly and about 20 years old. There are 108 trees in the patch, and from these Mr. Abernathie gathered and sold at \$1 a box to J. Z. Anderson, 1045 40-lb. boxes of pears (this lacks just 35 pounds of being ten boxes to the tree). The best part of the business is that each year the yield is about the same. Besides the fruit sold, there are enough small pears to pay all expenses of cultivation.

Sonoma.

RICHNESS OF SOIL.—*Santa Rosa Republican*: Wesley Woods, who is farming a portion of the Hanneth estate, two miles east of this city, has furnished us with the following data. The same land that he is now cultivating has been sown to grain for 22 consecutive years and the yield this year is as follows: Oats, 60 bushels to the acre; barley, 55 bushels; wheat, 43 bushels. When the land was first farmed in 1855 it was sown to barley and the yield was only 52 bushels to the acre. Now after a period of 32 years, without any rest, the increase is 8 bushels to the acre.

Stanislaus.

HARVESTER BURNED.—On Tuesday, near Ceres, the Young Combined Harvester, owned by W. Whitney, was totally destroyed by fire while the crew was at dinner. The precaution had been taken to drive the machine across the road, out of the standing wheat, and no grain was burned. The fire is supposed to have been caused by a hot box at the end of the draper.

COYOTES OUTWITTED.—*Modesto News*: A large den of coyotes was found on the McMillan ranch, near Knight's Ferry, this summer by his header crew. Frequently the men took their rifles in hopes to kill some of them, but in vain. Last week Ally McMillan and Ed Parlier took some fresh meat, poisoned it with strychnine, proceeded to the den, and scattered bits of the meat. Next day they found three of the largest coyotes that have ever been killed in Stanislaus county.

Yuba.

GROWING CASTOR BEANS.—*Marysville Appeal*: A large number of acres in the lowlands east of Meridian and Moon's Ferry are planted in castor beans, and the owners say that the profits per acre will run from \$12 to \$20. They have gathered two and three crops thus far this season.

NEVADA.

GRAIN AND ALFALFA.—*Reno Gazette*: C. T. Bender of the First National Bank came in last night from Lovelock, and brought with him a beautiful specimen sheaf of wheat and oats. The oats stood six and a half feet high and attracted the attention of every "old-timer" at the depot, as well as that of many inquisitive strangers. It was grown on the ranch of J. H. Theis, about three miles from Lovelock. The land yields 60 bushels of wheat and 80 bushels of oats to the acre. The richness of the soil is due to the overflows of the sink of the Humboldt in centuries gone by. Joe Marcy will stack 4000 tons of alfalfa this season quite close to where the specimen mentioned came from, while the Marker Bros. will stack 3000 tons.

The Fair at Santa Rosa.

The ninth annual fair of the Sonoma County Agricultural Park Association began at Santa Rosa, Monday, August 22, and continued, with growing interest, to the end of the week.

A member of the *RURAL*'s editorial staff went up from San Francisco Saturday morning to make a hasty survey of the exhibits, and catch a few notes on the spot. As the train rolled away from the Marin county landing, grand were the glimpses caught of Mt. Tamalpais, whose rocky summit showed clear above the fog-drifts that swept along his rugged sides. On we sped over miles of salt-marsh, through brown pastures, where cattle grazed and colts were scampering; among changeable hills, where on ambitious vineyards crowd back the native groves; past tidy, bustling Petaluma, and through young orchards, with corn flourishing between their rows, and found ourselves, a good hour before noon, in the streets of Santa Rosa, lined with neat brick structures and abundant shade trees.

Entering one of the many vehicles that plied between the city and the fair-grounds, we reached the track in time to see a goodly portion of the live-stock led past the judges' stand, and the prize-winners decorated with their blue ribbons. There were superb and mighty draft-stallions—some clad in satiny black, another iron-gray, and others light-dappled. The two great Cleveland bays, "Baron Hilton" and "Royal Studley," shown by Seth Cook of Danville, were marvelously beautiful in their lithe vigor and graceful dignity. And Mart Rollins' sorrel roadster-stallion "Rosewood" was a most elegant and spirited creature to look upon.

At the head of the procession of cattle there marched in sheeny majesty Cook's black Polled Aberdeen Angus bull, "Marathon of Fintry" (said to weigh 2200 lbs.), followed by a dozen jetty members of the same family. Then came the fine-looking Jerseys, Holsteins, Shorthorns, and graded cattle—perhaps 50 bovine head, all told.

A stroller past the stables, after lunch, found many of them shut; but frequent glances were had at slim, sleek speeders, carefully tended, before one came to the open stalls of the magnificent black Clydesdale, "Pride of Cree" and his neighbor, the black Norman, "Trumpette," entered by the Sonoma Stock-Breeders' Association. J. H. Laughlin's Clydesdales "Dina," with prize colt, "Black Mollie," and his black yearling jack, "Yolo Chief," were among the few other animals visible.

Of the swine-pens, the sole remaining occupants were R. H. Crane's big two-year-old "Theodore" (what a name to give a boar), who sharply grunted disapproval at being spoken to, "Lucy," of the same age, and one younger specimen of the Poland China breed.

The ovine delegation embraced R. H. Crane's 16 Southdowns—one ram, and ewes, ram lambs and ewe lambs in fives—R. B. Cannon's Shropshire buck and 16 grades, and, over against their white fleeces and dark faces and feet, E. W. Woolsey & Son's Spanish merinos, eight in number, with clear, flesh-colored muzzles, heavy dust-blackened coats and big cork-screw horns, contentedly chewing their cud.

In the poultry department, 30 coops or more were occupied. H. Hoag showed game fowl and Bantams. T. C. Starr had tricos of big Langshans, Plymouth Rocks, Partridge and Buff Cochins and Light Brahmas, the latter especially handsome. Plymouth Rocks, Langshans and both Brown and White Leghorns were exhibited by several parties; Black Spanish, also, by H. E. Phillips; Silver-Spangled Hamburgs by W. H. Hudson; Bronze Turkeys and Pea fowl by Julius Ort; Toulouse Geese by H. H. Button, and pure-white Fantail pigeons by V. Piezzi. One coop was devoted to a freak in the shape of a rooster, with a paunch like a duck and very short legs on which he stood upright, penguin-fashion, and walked with difficulty. When he wished to feed, he would lie down flat on his breast and in that posture pick up corn. A pair of lovely white rabbits and half a dozen California quail added variety and beauty to the exhibits.

In the Pavilion.

The display of the Pomona Grange was the foremost feature, the tables on which it was made being set in the middle of the floor and extending nearly the entire length of the building. The choicest of green fruit—pears, peaches, plums, nectarines, grapes, etc.—was put forth in vast variety. A fine assortment of dried fruits and berries under glass from Button's drier; a case holding specimens of silk, and 17 medals—three gold and 14 silver—won at State, Mechanics' and Sonoma county fairs; a set of little slabs of native woods, duly labeled; hundreds of glass jars, containing samples of seeds, grains, nuts, etc., arranged on flights of shelves, capped with bottles of native vintage; the most luscious of large blackberries, grown without irrigation; huge beets and cabbages, musk and watermelons, corn and squashes, and a sunflower head 17 inches across its face, were among the objects we caught sight of. But there was scanty time for inspection Saturday, as the dismantling of the boards and packing of the exhibits for removal to Petaluma began early in the afternoon—a procedure which the numerous small boys deemed the signal for frugal raiding.

Prof. Neuman's sericultural exhibit, to which a place had been assigned on the Grange table, is described in the *Democrat* as follows:

"The valuable little insect is to be seen in its various stages of growth—from the egg just laid by the moth before its death, through the larva and chrysalis, to the moth itself. The collection also contains specimens of the wild silkworm, a native of California, which Prof. Neuman in his enthusiasm declares is destined to create a revolution in silk culture. The worm resembles the green tomato or tobacco-worm, and feeds on the wild coffeeberry plant, also a native of this country. The exhibition has created no little interest, and greatly aided the professor in his efforts to popularize silk culture."

To the pillars supporting the gallery-front were bound stalks of corn and sheaves of grain; leafy and fruit-fraught boughs hung from cross-lines aloft, and high over all was strung a bright-hued banner, whereon were vividly depicted Sonoma's purple hills, golden grain-fields and thriving vineyards.

It was pleasant to meet again Messrs. Hawkins, Rogers, Whitaker and Adams, whose faces became so familiar to us during the Mechanics' Fair a year ago, and we felt that the Pomona Grange had shown its wisdom in securing this veteran committee to care for the displays the present season.

Disposed around the sides of the pavilion, on the lower floor, were some fine vehicles, plows and other implements, the ingenious Empire fence machine, the handsome outputs of the cannery and Del Monte Milling Company, and a beauteous mound of greenery and bloom, exhibited by M. H. Dunn, a local florist. A little electric pump, by Zinks & Ruhlman, kept steadily at its work and attracted some notice.

In the spacious galleries, beside the elegant furniture and saddlery, the skillful needle-work and all the varied witchery of the art-room, which the lateness of the hour forced us to slight utterly, was a very creditable display of vegetables from the county farm, arranged by Superintendent C. W. Hawkins. The placards for this exhibit were written mostly in the rinds of big squashes, where they had been growing apparently for weeks.

Sixteen boxes of choice pears represented as many varieties—namely, Flemish Beauty, Vicar, Beurre d'Anjou, Sheldon, Seckel, Beurre Hardy, Urbaniste, Keiffer, Beurre Clairgeau, Beurre Easter, White Doyenne, Duchess d'Angouleme, Louise Bonne de Jersey, Lawrence, Winter Nelis and Souvenir du Congress. These were shown by E. H. Smyth, a Santa Rosa paint-dealer, who is evidently a successful fruit-grower besides. A large and tastefully ordered collection of natural-history specimens, comprising minerals, fossils, shells, insects, etc., invited hours of study while we had but a few tantalizing minutes.

The loaves, both white and brown, which had been cut and were tasted by the visitor, proved that the fair bread-makers of Sonoma county have attained a high degree of excellence.

As the time for the closing races drew near, crowds gathered upon the grand stand and the places commanding good views of the track, and strains of instrumental music from the band alternated with the yells of the pool-seller. We mingled awhile with the spectators, witnessed the flyers' single dash and the decisive heats of the first trotting, partaking somewhat of the excitement of the occasion—and found our opinion of horse-racing, as an element of the agricultural fair, substantially unchanged.

The attendance during the week and the financial results proved very satisfying. On Thursday, particularly, business in town was generally suspended by common consent, schools were dismissed—even the real-estate dealers relaxed their efforts, and Hon. J. K. Luttrell (Senator Vrooman's substitute) had a great concourse of hearers. He spoke for upward of an hour, reviewing the history of the county and the rise and progress of Santa Rosa; giving a graphic sketch of the labors of the Agricultural Park Association, and dwelling at length upon the outlook and possibilities of Sonoma, with the combined labors of the various organizations now in existence. The address was received with much enthusiasm, and the speaker retired amid prolonged applause.

One noticeable feature of the fair this year was the scarcity of a certain class who have been wont to swarm on such occasions. The city authorities had lately passed an ordinance prohibiting the running of all chance games during fair week. The directors of the Agricultural Park Association resolved to the same effect, and issued no privileges for the conducting of wheels of fortune, dice or similar games within the fair-ground limits, yielding to the gamblers only so far as to admit the pool-seller. This action has produced encouraging results, and may well be carried one step further in the future.

The advent of the boom was evident in the many showy signs of real-estate dealers. Daylight hardly sufficed to dispatch their press of business, and some of their offices were lighted well into the night.

Premiums.

The following awards on live-stock were made on Saturday. Others are to be announced later.

Horses.

THOROUGHBREDS.—P. Carroll took all premiums except one, viz.: C. Underhill, best 4-yr-old mare, Rosette. Graded—Jos. Purington, 9-yr-old stallion, Alexander, Guerne & Murphy, suckling horse colt, Frenchy; 9-yr-old mare, Josie French. J. H. Laughlin, 1-yr-old stallion, Mark L.

HORSES OF ALL WORK.—Stallions—J. T. Car-

michael, 4-yr-old and over, Darkness. J. W. 3-yr-old stallion, Blaine. J. Keeler, 1-yr-old stallion, Tobe. J. R. Green, suckling horse colt, Mares—J. W. Wiley, 4-yr-old, Liza; 3-yr-old, Maud. J. T. Carmichael, 2-yr-old, Molly. J. H. Laughlin, 1-yr-old, Queen. Families—J. T. Carmichael, family stallion, Darkness, with colts Risa, Benton, Dolly, John and Molly.

DRAFT HORSES.—Stallions—Sonoma Co. Stock Breeders' Association, 4-yr-old and over, Trumpette. J. F. Cooke, 3-yr-old, Crown Duke. F. Roberts, 3-yr-old, Pointsman, Jr. Mares—Crane & Hill, 4-yr-old and over, Anne. John Gamble, 3-yr-old, no name. A. H. Crane, 2-yr-old, Ann. Crane & Hill, 1-yr-old, Bessie. J. H. Laughlin, suckling colt, Black Mollie.

ROADSTERS.—Stallions—John Strong, draft horses in walking match, Mart Rollins, 4-yr-old, Rosewood. G. E. Guerne, 2-yr-old Alfred G. G. E. Grosse, 1-yr-old, Guy E.; suckling colt, Guess. J. H. Laughlin, gelding, Seldon. Mares—J. Gamble, 4-yr-old and over, May. J. H. Laughlin, 2-yr-old, Roxie. G. E. Grosse, 1-yr-old, Bridget. C. Underhill, suckling colt; no name. Families—J. Purington, family roadster, Alexander, with Grover Cleveland, Daisy, Star, Sallie Walker and May Walker.

CARRIAGE AND SADDLE HORSES.—Jessie Peters, family carriage team. J. L. Walker, single buggy mare, Nettie J. Jas. Austin, saddle horse, Jake.

STANDARD TROTTERS.—Stallions—Dick Button. I. De Turk, 2-yr-old, Anteeo Button, Guerne & Murphy, 1-yr-old, G. & M. Mares—Guerne & Murphy, 6-yr-old and over, Daisy. E. W. Woolsey & Son, suckling colt, Twilight.

JACKS.—J. H. Laughlin, 1-yr-old jack, Yolo Chief.

Cattle.

POLLED ABERDEEN.—Seth Cook, best exhibit. **DURHAM.**—Bulls—V. Piezzi, 2-yr-old, Fingermark. R. H. Crane, 1-yr-old, Blaisdale. Cows—V. Piezzi, 3-yr-old, Sally; 2-yr-old, Minnie.

JERSEY.—E. W. Woolsey & Son, 4-yr-old bull, Ronda; 4-yr-old cow, Berkeley Maid; heifer calf, Daisy.

HOLSTEIN.—Guerne & Murphy, 3-yr-old cow, Hicke; heifer calf, Maud; bull calf, no name.

GRADED CATTLE.—W. S. M. Wright, bull, Winfield. Guerne & Murphy, bull calf, Dick. V. Piezzi, 4-yr-old cow, Fannie; 1-yr-old cow, Clara; heifer calf, Maggie; fat cow, Dora.

Stockton Notes.

EDITORS PRESS:—Circumstances have prevented me from writing since the harvest, which proved abundant, and paid well those fortunate enough to sell, deliver, and get their money while wheat was at \$1.70, \$1.80 and \$1.82. But, alas! the crash came when wheat was \$8 a ton higher than in Liverpool, and some had to take their wheat back. A large number are storing, while the market is at \$1.25. Dealers say it will brighten to \$1.45 for a time, at least. The uncertainty of the grain market is stimulating fruit and nut culture all over this county, which it is a proven fact, produces the finest shipping fruit, unequalled in flavor.

The boom, begun in wide-awake Lodi, has set land agog in Stockton. In city, suburbs and country, sales go on. People with winter chill in their bones have come to stay; sojourners, seeing the soil yielded its fullness and the climate its healthfulness, are buying; citizens are rushing around, looking up lots and records, and many farms are being sold at \$70, \$100, and \$150 per acre—cheap for their goodness, compared to lands in other counties.

The pavilion is grand—the finest in the State—and reflects great credit on the stirring character of L. U. Shippee, president of the State Agricultural Society, and S. J. V. District Society. The committee of 100 gentlemen and 100 ladies, under the guidance of Mr. Wolf and Mr. Dohrmann of the Kindergarten, are active in plans to decorate and fill the building, now nearly done, and a rousing fair is a certainty.

Pomona Grange, No. 3, under the experienced leadership of J. D. Huffman, is, through the subordinate Granges, gathering every product of the county and its manufactured complement to fill 2000 feet of space at the State Fair, to compete generously with adjacent counties at Stockton and help dedicate the pavilion to all that is excellent in labor or skill.

The summer has been cool, except a few days. No need to go to the sea-shore for pleasant days. The big circuses and the coast pick up all loose change in the interior.

MRS. W. D. ASHLEY.

Stockton, Aug. 29, 1887.

SAYS THE ALBUQUERQUE DEMOCRAT: Several prominent Arizona capitalists are contemplating a canal enterprise that promises to be a successful venture. The Gila river will be tapped at the Box canyon, eight miles above Agua Caliente Springs. The canal will be 30 miles long and about 40 feet wide, and is intended to cover considerable of the mesa land in the vicinity of the Eagle Tail mountains.

A COMPANY has incorporated in Redding for the purpose of taking water from the Sacramento river for irrigating purposes. The river will be dammed near Clear Creek, 12 miles above there, and 100,000 inches of water taken out. The company is composed of San Francisco and Redding capitalists, and the work will undoubtedly be pushed vigorously.

LATEST INFORMATION from the mouth of the Klamath is that the fisheries there are turning out remarkably well. As many as 500 fine salmon is not an extraordinary catch there, and as high as 1000 are frequently caught at one haul of the seine.

Wayward Love.

[Written for the RURAL PRESS by DAGMAR MARIAGER.]

I loved one loved by many, rich in all
The needs and luxuries of pompous sway;
His infant straying doomed my love to fall,
And like a worthless thing 'twas cast away.

Again I loved unwisely, I must own—
I loved a lovely face and winning way;
My ardent love then lost its lofty throne,
And like a worthless thing 'twas cast away.

Once more I loved—he hero of an hour,
And he was grandly eloquent and gay;
An impulse and an accident gave power,
And then again my love was cast away.

I loved a jurist for his magnetism,
The force with which he could his case portray;
His gravity, sarcasm and witticism,
And once again I cast my love away.

Once more my wayward love was to be snared—
He was an actor good in grand array;
My love became a passion, but he spared
It not, and I the madness cast away.

My scattered loves I gathered and embraced,
As subjects to my reason's cold assay;
Not wholly base, but awkwardly misplaced,
They'd served as painful evils on my way.

"Dear love within my bosom," then I said,
"Cast vanity aside; be thou a sage;
Dive 'neath the glittering surface unafraid,
And worthy welcomes will thy rest engage."

Fuss and Feathers.

[Written for the RURAL PRESS by THEODORA HOLLY.]

It was one of those June mornings when all nature is happy and gay. The meadow larks poured forth their melodies and the modest linnets joined their sweet notes to the chorus. The sky was soft and blue, and the lazy clouds rested motionless, as if not deeming it worth their while to sail. The dewdrops sparkled and glistened in the sunshine like rare rubies. The roses danced gaily in the breeze, at times peeping in at the window to "bid good morrow," and, as I have said, on this fair morning all nature was happy and gay; but still Mrs. Jones looked sad. This was not her wont—it was as if a cloud had darkened the sunshine. It was evident that something disturbed her peace of mind. At last, turning to her daughter, she said:

"Milly, have you seen anything of Bantam? I cannot find her anywhere."

"O mamma! she can't be lost, for I saw her only yesterday," replied Milly.

"I hope that we can find her," said Mrs. Jones anxiously, "for I set such a store by her—she is worth her weight in gold," and had she been the fabulous hen that laid the golden eggs, Mrs. Jones could not have prized her more highly, for if that worthy lady had a weakness it was for fine poultry. Mrs. Jones and Milly searched until noon—searched high and low, as Mrs. Jones told her husband, but no Bantam was to be found. Mr. Jones listened quietly to the end of the harrowing tale, and then, much to his wife's horror, carelessly remarked:

"Oh, well, she will come around in a few days, and if she is lost it won't take a mine to buy another; they are not so scarce as that."

"Oh, but I never shall find one like her: she is the finest Bantam I ever saw," replied Mrs. Jones, mournfully.

After Mrs. Jones had washed the dishes and put everything in its place, she donned her sunbonnet and went over to Mrs. Smith's to confide all her fears concerning her Bantam to that good woman, for she knew that Mrs. Smith would not treat such a serious matter as indifferently as Mr. Jones had done, for these two women had always been the best of friends, agreeing in all points of poultry, and many were the amiable chats they held, while healing stockings, over the best way of bringing up young chickens.

Susie and Milly cared not for the best way to bring up young chicks, nor cared they for the wise talk of their fathers as they swung merrily on the gate. Thus their small world rolled peacefully on, undisturbed by thoughts of the great outside world, with its bustling cities and enterprising railroads. But soon this calm state of affairs was all changed—for after Mrs. Jones had poured her tale of woe into the intent ear of her friend, and she had fully sympathized with her, and had reassured her again and again that her pet would soon return, Mrs. Smith led the way to the barnyard, saying, "I want to show you my beautiful new Bantam," pointing as she spoke with no little pride to a fine fowl that was busily eating scattered grain, and great was Mrs. Jones' surprise to recognize her own Bantam, with all its peculiar marks—every spot and every feather the same; and great, too, was Mrs. Smith's surprise at her friend's strange behavior, who hemmed and cleared her throat, and then said, coldly:

"You are mistaken; that is my Bantam and I did not think that you would play such a joke on an old friend."

"Your Bantam," cried Mrs. Smith. "Why, I bought her yesterday."

"Madam," said Mrs. Jones, in a voice that sent a chill to her friend's heart, "I could swear that that Bantam was mine. I should know her 20 miles from home."

"Samantha Lucretia Jones, do you mean to say that I have stolen your Bantam?" asked Mrs. Smith, her face red with wrath; but Mrs. Jones, not deigning to answer her question, bowed coldly as she stalked out of the barnyard, saying, "I never was so deceived in any one in my life before—never!"

Mrs. Smith rushed into the house and threw herself upon the bed, moaning, "How could she, after knowing me all these years—" but to all outward appearance, Mrs. Jones was calm. She related what had transpired to her household, at the end of which she repeated with great emphasis: "I was never so deceived in my life before—never."

"Stuff and nonsense!" said Mr. Jones. "Why, the idea! You would suspect your best friend of stealing! I have no patience with women—no knowing what would become of them if it were not for the men." Delivering himself thus, he walked dignifiedly out of the room.

I do not say whether it was curiosity or not that caused him to look into Mrs. Smith's barnyard—but what he saw there much surprised him; but, of course, he would not acknowledge it to any one but himself, for there was his own bantam, looking very contented, and quite at home in his neighbor's barnyard. He turned and re-entered the house, took his pipe deliberately from his mouth and said: "I thought so. It is our bantam, as I said."

Mrs. Jones looked astonished and somewhat vexed, but thought silence the better part of valor. Mr. Jones took his accustomed seat on the back porch, wrapped in deep thought—the subject of his thoughts was Mr. Smith and his deceitful wife. As for Mr. Smith, he felt both disgust and pity, and wondered what graces he had found in Mrs. Smith to fascinate him, forgetting that he himself had once fancied her to be a very nice girl. And as for Mrs. Smith, he wondered what she would do, now that she had been found out. "Poor, deluded creature!" he said, heaving a deep sigh for his friend Smith.

The news of the trouble between the two friends spread over the country as if borne on the wings of the wind. Neighbors became suddenly aware that they owed Mrs. Jones or Mrs. Smith a call. The village gossip put on her sunbonnet, and, taking a basket over her arm, started for Mrs. Jones—her errand to borrow some eggs, though plenty were stowed on her pantry shelf. After she had completed her mission, which was really not to borrow eggs, but to find out all that she could concerning the misunderstanding, she departed, and on her homeward way she paused at the gate of Mrs. Smith, and then, with a chuckle, passed through, saying: "I guess I'll drop in. I haven't been to see her for quite a spell."

Never was there such a commotion—even Grannie Jenkins' cap came askew, and she sat up straighter than ever in the great old-fashioned arm-chair, arguing the question with poor Miss Betsy Ann, whose thin, cracked voice became more cracked than ever in her excitement.

Fashionable Mrs. Bon Ton, who lived on the corner, issued invitations to all her friends to take tea with her, and 5 o'clock found them in her pretty dining-room, talking over the scandal, as they gently sipped their tea from dainty china cups.

It was somewhat embarrassing for those two good husbands, Mr. Jones and Mr. Smith, to meet.

"Good-morning, Mr. Smith," said Mr. Jones; "couldn't find a nicer day for making hay."

"No," briefly replied Mr. Smith. A pause followed in which Mr. Jones looked very hard at the toe of his boot, and Mr. Smith became very much interested in the examination of a crack in the sidewalk; and then Mr. Jones said, with the air of one who is saying something very original: "Fine day for making hay; couldn't find a finer one if we had picked it out ourselves."

Each tried to appear as if nothing had happened, and each thought that he had succeeded admirably. Mr. Jones noticed that his friend looked uneasy, and thought that he would let him know that the trouble had made no difference with his friendship; accordingly he said, "I am very sorry that there has been any trouble between our wives," and then he sympathetically added, "I hope your wife will soon come to her senses."

At this remark Mr. Smith became very choleric and red in the face, and opened his mouth to speak, but Mr. Jones interrupted him with, "Don't be so affected, old friend; it must be a hard blow, but bear up under it," and he soothingly placed his hand upon his friend's arm.

"How dare you speak so of my wife?" said Mr. Smith, thrusting his friend's hand aside. "My wife is honor itself, while I should think you would be so ashamed of yours that you could not look honest people in the face," and he strode angrily away; and these two who had been friends from boyhood parted with resentment in their hearts.

Those young misses, Milly and Susie, aged respectively eight and nine, and who were just staggering through the multiplication table together, met on their way to school.

Susie said boldly: "Don't you think that

your ma is real mean to tell my ma that she takes things that don't belong to her?"

"No, I don't," returned Milly, who had a full allowance of American independence. "My ma is just as sweet as she can be," and she added with bitter sarcasm, "I don't see how you can love such a ma as you have one bit." And for the first time they went separate ways to school, each vowing that they would not speak to the other again.

The school-children were so surprised at such a state of affairs, for these two friends, Susie and Milly, had always been inseparable—playing together, and eating their lunch side by side under the great oak tree. But now they let each other severely alone. And no wonder that the school-children almost thought that the world had come to an end.

The Sunday church-bells were pealing when Mr. Jones and family, as all religious people should do, started for church. As they entered the vestibule there stood Mr. Smith, his good wife and daughter, who seemed sublimely ignorant of their existence, and the Jones family were equal to the occasion. After they were seated in their pews, Mrs. Jones, as the Smith pew was directly in front of theirs, had full opportunity of generously criticising her friend's back, and much to her joy discovered a tear in Mrs. Smith's cloak most ingeniously mended, and at this, of course, she sniffed the air and derived a deal of comfort therefrom. And Mrs. Smith consoled herself with the thought that she was not as conceited as Mrs. Jones.

Mr. Jones noticed that Mr. Smith's collar was somewhat limp, "and that," he soliloquized, "shows what kind of a wife he has;" and then he thought of his own stiff collar and gazed affectionately at his wife. I need not add that Mr. Smith's breast was not filled with a holy calm, for the thoughts that raged there were not fitting for such a place, and he a deacon of the church.

Milly and Susie being supported by the example of their parents, exchanged scornful glances between the parson's pauses. There seemed to be a great attraction in the direction of the Smiths and Jones, for the congregation cast stealthy and frequent glances toward them. After the services had ended the people loitered in the vestibule to talk over the sermon, and the gossips had ample time to mention the difficulty between the Smiths and Jones. But these worthy people, being aware of the general attention that they attracted, passed quickly out, not remaining, as usual, to discuss the fine points of the sermon; and, to speak truly, I do not think that they could have told whether it was on the descent of man or the best receipt for making fruit cake.

It was one bright morning about three weeks after the disappearance of the bantam that Mr. Jones stepped out on the back porch, and to his great astonishment there stood mother Bantam looking very demure, while 13 young bantams brought up the rear. Mr. Jones gave another glance to reassure himself that it really was their bantam, and then burst in upon Mrs. Jones, who was quietly clearing the table of the breakfast dishes, saying, "Bantam and her chickens have returned just as I said, and if you had listened to my advice you would not have got us both into such a scrape, but women always think they know more than any one else, and when they have a foolish quarrel themselves, they are never satisfied until they drag the men in too, and there is no knowing what the end of this will be;" and slamming the door behind him he sought relief in the open air, leaving poor Mrs. Jones to recover from her emotions as best she might.

As he walked aimlessly down the lane he met Mr. Smith, to whom he explained matters and very penitently begged forgiveness for both his wife and himself, and added pleadingly, "For old friendship sake, don't let this trouble part us."

At first Mr. Smith was unmoved, for he thought that his wife had been shamefully treated, but at last, acknowledging the plea of old friendship, he relented and took Mr. Jones to the house to make peace with his wife. They paused on the threshold with surprise at the unexpected sight of Mrs. Jones sobbing violently in the arms of her friend, as limp as a bedraggled sunbonnet with all the starch out of it. Susie and Milly had already made their peace over the division of a bag of candy, and were swinging merrily on the old apple bough.

It was at a generous feast, some time after this, provided by Mr. Jones and cooked to a nicety by his good wife, who, in her heart, called it a thanksgiving dinner, for never had she given thanks more heartily than when she saw her old friends again seated happily around her family board, that Mr. Jones gave a toast for the first time in his life in which he lauded the virtues of Mrs. Smith in a very delicate and flattering manner, which made that worthy soul blush with pleasure, and entirely melted her husband's heart, who, although he had granted his friend forgiveness, yet had not until then felt his former affection for him, as his maxim was "A friend in need is a friend indeed." Again Mrs. Bon Ton issued invitation cards to her friends to tea, and it was poor Betsy Ann who, in her thin cracked voice, told Grannie Jenkins of the reconciliation of the Jones and Smiths, who both at an early hour received calls from the village gossip.

In relation to the events recorded, some people remarked fretfully that they thought that "it was much ado about nothing," while others cheerfully replied that "All is well that ends well."

Some Wild Birds' Songs.

[Written for the RURAL PRESS by FANNIE H. AVERY.]

Some wild birds' songs are short and broken,
And yet are earnest, sweet and clear;
And breathe of much that is unspoken,
As could no chant of loudest cheer.

They cannot voice what joys elate them
Like the more gifted feathered throng;
But not less lightly let us rate them,
Because they lack great powers of song.

What though their strains fail to give utterance
Of all they think and feel and know?
Much speech is of but small importance
If hearts with grateful fervor glow.

Perhaps the One who reads the writing
Stamped on the tablets of the mind,
May find these wild birds' songs inviting
As those of more melodious kind.

A Bird Visitor.

Several weeks ago the RURAL entertained us with "Aunt Susie's" account of the "Mud-builders," and now comes Dr. Gally with his observations on the road-runner to interest and amuse. These anecdotes have led me to conclude to tell about a small bird visitor we have had among us for some days.

But, first, I want to say that I read "Aunt Susie's" story aloud to the children, much to their satisfaction. Indeed when I got to the end of it they wanted to hear "more," so I had to go over it and point out and dilate on the different parts to please them. How much little folks are interested in such things, and how much they want to know about them! They think of what they see and hear, too. Only a short time since a little girl I know asked her mamma if birds went to heaven. On being questioned as to her reason for making such a query, she answered: "The little birds can fly; they have wings."

I also intend to read what Dr. Gally has written about that odd bird, the road-runner, to our little ones.

(In passing, I want to say that I differ with Dr. Gally, inasmuch as the geographical distribution of birds and animals, etc., interests me exceedingly, and appears to me a perfectly legitimate field for observation and speculation.)

But to my story. Several days ago my little boy Georgie came into the house bearing a bird's nest in his hands, in which was ensconced a solitary nestling, not old enough by a week or more to fly.

I gazed with dismay and compassion at the living fright. What was I to do with that tiny, helpless thing? Somehow anything, no matter how small it is, that has the divine gift of life in it, always appears sacred to me. I took the bird—one of the common wild species—and promised to take care of it. It seemed some men had been cutting down trees on the sidewalk near by, and in one was this trophy, which Georgie captured and brought home.

I first tried to feed it, but in vain. I could not get it to open its mouth; so I concluded to let it alone for awhile. Later, as I sat sewing near by, my ears were greeted by a loud chirp, which was followed by several more. Delighted, I turned to the bird and responded with a feeble imitation of its call. What was my surprise to see it open its little beak as wide as could be, the chirping still continuing. Concluding it wanted food, I soaked some bread in water, and had no trouble feeding it; only it would not eat much at a time. When the children came in, how pleased they were to see it eat. They had only to chirp at it, and the little thing would immediately respond. And if we forgot it for a time it would soon let us know it was there, and hungry. Its presence has been a source of real pleasure to the whole household, each of whom manifests interest in its welfare. At first, some of us thought we would not be able to keep it alive, but we have had it four days now and it is as lively as it was at first. Of course we think it an exceptionally bright bird. It is perfectly at home, and has the cunning habit of trying to hide itself in a dark corner sometimes, after it has been fed. Once it got inside the sleeve of one of our folks and ran up his arm.

I had to throw the nest out, it made the place so untidy. It was quite large—ever so much bigger than another nest a friend brought me once, and which hangs in a conspicuous place on the wall. This is a humming-bird's nest, and such a dainty bit of architecture as it is! It is built right at the end of two branches, and in such a way that it comes right under the green roof of a broad leaf. It is very, very small, yet how many thoughts it suggests:

A frail and tiny treasure-trove,
And yet how strong a token
Of earthly and of heavenly love,
And truth that is unspoken.

We are going to keep our little bird-visitor until it is able to fly and strong enough to look out for itself. Then we will let it go free. I wonder if it will be kindly received by its kith and kin when it returns to them? I hope so. I remember reading in Henry O. Forbes' book, "A Naturalist's Wanderings," of a monkey he had kept in captivity, but which he gave its liberty, because when it heard the cries of its mates in the forest it would assume the most piteous expression of countenance and demeanor. When, however, it returned to its former life in the woods, its companions would have nothing to do with it. Probably in the end, though, they did associate with it, after it had lived a wild life again for awhile.

We will be sorry to part with our little bird,

so easily do hearts become attached to anything that is lovable. And it? Will it have any regrets at leaving us, I wonder?
San Francisco.

Brief Correspondence.

EDITORS PRESS:—The following brief correspondence recently passed between two brothers, the one 84 years old, and the other 65 years, who, for more than half a century, had kept up an uninterrupted friendly correspondence, but between whom there had sprung up a slight coolness, thus illustrating the saying, "No fool so big a fool as an old fool."

JOHN: Let us pray. ALLEN.
ALLEN: Prov. xxiii 19. Amen. JOHN.
CORRESPONDENT.

TRYING TO KEEP COOL.—J. H. Harding, who lives near Fresno, has devised a somewhat novel dwelling, within which a refreshing coolness may be enjoyed when the mercury is high outside. He calls it his new plan for an adobe house, and gives the *Republican* his recipe as follows: "First lay upon the ground 2x12 redwood for mudsills, and use the same material for studding. Board up the inside to the top of plate with heavy lumber, and securely batten all the cracks, nailing only battens on to the edge of the upper boards. As you nail on the rustic outside fill in the space with dry, clean earth, and tamp down well, and fill thus till you reach the top. Use 2x12 joist overhead, and ceil beneath, battening cracks securely, fill half full of earth. Put on the roof, leaving a space of four or five inches on each side at the plate for ventilation. Let the roof project at least four feet on sides and ends to keep the sun from striking the walls, and you will have a house which is always cool in summer and warm in winter, and about as solid as Plymouth Rock." As a matter of course it requires a little more expense to build this sort of house than it does a thin shell, but does not the comfort which it will afford for years compensate many times over the additional expense?

TAKE CARE OF THE MATCHES.—The Nevada City *Transcript* says that about three years ago the matches kept in a tin box at G. M. Hughes' planing-mill disappeared so rapidly that some person around the establishment might have been suspected of filching them, had it not been known that all the employees were strictly honest. Long afterward some changes were made in the building, and on tearing down a wall, there came to light a quantity of matches with the heads gone, the latter having been apparently eaten off by rats. Many dead rats were found in the same place, giving proof of the correctness of the theory that the rodents had stolen the matches and devoured the sulphur upon them. One bunch of matches had been ignited while being chewed, but had only partially burned. Moral—Keep your matches where rats can't get hold of them.

"THE WORLD OWES ME A LIVING."—Why does it? What have you done for the world to entitle you to merit a living from it? These questions often arise in our mind when we hear a great lubberly fellow, with both hands plunged into his pants' pockets, roll a huge quid of tobacco from one cheek to the other, and with an oath exclaim: "The world owes me a living and I'm bound to have it!" No, no, we beg leave to differ with you, for the world owes you nothing unless you earn it. Nearly all are endowed with physical or mental qualities which enable them to be of some use in the world, and unless we make suitable use of those gifts we cannot conscientiously claim our living as a matter of right.—*Ex.*

METAL NECKTIES.—Scarfs and neckties of metal are a new German invention. Gold, platinum and silver strips are welded, after the mosaic style, upon a metal ground, prepared by the incandescent process, then compressed by means of powerful presses, and finally elongated by rolling into long sheets or strips. The colors are yellow, red, green, white, gray and black, and the scarfs, being indestructible, are considered of practical value.

THE CIRCULATION OF THE BLOOD through the lungs was first announced to the world by Michael Servetus, a French physician, in 1553. Caisalpinus published an account of its general circulation through the system in 1569; but his ideas were somewhat confused. It was not fully understood, however, until Harvey took it in hand in 1628.

CALICO was first imported into England by the East India Company in 1631. Calico printing and the Dutch loom engine were first introduced into England in 1676—45 years later.

"A BOY assassinated," read Mrs. Bascom from the newspaper. "Well," she remarked, "a assassin' boy is a great trial, but I don't think he ought to be hanged for it."

WOMEN AS INVENTORS.—Up to Dec. 14, 1886, there had been granted to women by the United States, letters patent for 1935 inventions.

YOUNG FOLKS' COLUMN.

Nelly's Story.

[Written for the RURAL PRESS by T. H. W.]

My little darling's soft brown eyes
Looked pleadingly into mine;
"Come, papa, tell me a story,
All about the olden time!"

"Not a story of elves and fairies,
For I don't think they are here;
But about the blessed Christ Child,
You know He is always near."

Well, a long time ago a little child
Knocked at a rich man's gate;
The wind blew cold and bitter,
And the night was growing late.

His clothes were torn and scanty,
His bare feet were weary and sore;
And he trembled with cold and hunger
As he knocked at the massive door.

When at last the door was opened,
In vain he asked for bread;
For pity and love in the rich man's heart
Had for many long years been dead.

The door had been closed in a moment,
When instead of a little child,
The rich man saw in heavenly light
The form of the Christ so mild.

He knelt to ask His forgiveness,
But too late it seemed to be;
"As ye did it not to the least of these
Ye did it not unto Me."

Leisure Hour Work.

[Written for the RURAL PRESS by ADAM F. BATELLE.]

Have some employment, some way of spending your leisure time. Not much work is exacted of young people when in school, but that is no reason they should not have some specialty on which to exercise care and attention.

Among the things commendable for promoting out-of-door exercise are flower or vegetable gardening, poultry-keeping or entomology, botany or mineralogy. This is not so heterogeneous a list as it may at first appear. The three last mentioned are practical if for nothing more than to know the pest which destroys your apple trees, the plant overrunning your meadow, or that curious rock scattered broadcast over the surrounding country. These employments may seem suited only to the country, yet in any but the largest cities something similar may be substituted.

The culture of silkworms requires only a room of even temperature and a few mulberry trees and patience. Many feel a repugnance for worms, but these silk-producing little creatures do not seem to belong to that category. Despite all that has been said to the contrary, there is a demand for the cocoons.

Something else that may be carried on in town is flower-gardening. The variety of flowers that a very small bed will produce is surprising. Perhaps you have flowers, but is it not mother or grandma who takes care of them? Every boy who lives on the farm should make a small vegetable garden each year. It may become a source of profit, for fresh vegetables and berries seldom fail to find a market.

The world is full of pleasant and profitable work, and those who look for it seldom fail to find it. "Pleasant and profitable" does not include "easy." The failures are they who hunt for "easy" places.

His Big Friend.

A crowd gathered on a wharf in San Francisco had an opportunity to see a dog rescue another dog from drowning, and go about his work as intelligently as if he had been the trained officer of a humane society.

A small terrier dog fell from the stringer of the wharf into the bay. He swam around for some time in a circle, and many plans were suggested for his rescue, but none of them proved practical. The little creature seemed doomed to a watery grave, for he was fast becoming exhausted. The female portion of the audience was much exercised, and gave many expressions of pity.

Just at the moment that all hopes of saving the terrier were given up, the bark of a dog in the crowd attracted attention, and there appeared upon the stringer, in front of the wharf, a large Newfoundland.

He saw the little fellow in the water, and, with a low wail, he ran to and fro along the wharf for a moment or two, and then, to the surprise of every one present, he sprang into the water and at once swam to the terrier.

He seized him by the neck with his teeth, and, after swimming about for some time, sighted the new sea-wall extension, about 100 yards distant, for which he headed.

Upon landing his burden on terra-firma, the Newfoundland gave two or three sharp barks, and seemed to be proud of what he had done. It was some time before the terrier was able to gain strength to walk away.

One of the witnesses to the strange sight patted the Newfoundland dog, and said, "This dog is mine, and I would not take \$1000 for him at this moment."

GOOD HEALTH.

A Medicinal Honey.

The discovery of a valuable medicinal product of wild bees is reported in a late number of the *New York Medical Journal*. The account is given as follows:

About three years ago a distinguished French naturalist, M. Guilmeth, who was traveling in Tasmania, came suddenly upon a grove of gigantic eucalyptus trees, from 260 to 390 feet high, and with a trunk so large at the base that it took 40 of his Kanakas, joining hands, to reach around one of them. High in these lofty trees he discovered what he at first took to be enormous galls, but which he soon ascertained to be the dwelling-places of swarms of small, black, wild bees of a variety before unknown to him. Dr. Thomas Caraman proposes for this bee the provisional name of *Apis nigra mellifica*. Besides being black and smaller than the ordinary honey-bee, this wild bee has its languet rather more developed than that of the domestic bee. M. Guilmeth attempted unsuccessfully to domesticate it in Tasmania. He caused some of these immense trees to be felled, and secured the honey. The largest individual store of honey weighed as much as 11,000 pounds avoirdupois.

The honey is described as a thick, homogeneous, somewhat transparent sirupy liquid of a deep orange color, having an odor suggestive at once of its containing eucalyptus principles. As the result of his experiments on himself and one of his friends, Dr. Thomas Caraman states that, on taking a tablespoonful of the honey in a little tepid water or milk, after a few moments one perceives a gentle, agreeable warmth take possession of the whole person. At the end of half an hour the elimination of the active principles by the air passages having begun, the voice becomes clearer and the breath perfumed; the lungs feel more elastic, more supple. Having continued the use of the honey for a week, four tablespoonfuls daily, the author, who speaks of himself as respectably fleshy, found that he could go up two pairs of stairs, two steps at a time, without stopping to take breath or feeling at all blown.

SCRAPINGS OF HORN TO SUBDUCE PAIN.—A physician writes as follows to a contemporary: "The fine scrapings of any common cattle's horn steeped in vinegar and bound hot as can be borne upon a wound will subdue pain almost instantly, and effectually subdue lockjaw. I have often used this remedy, and have never had a failure. In wounds torn and lacerated, as for example, where a nail has been stepped on penetrating the sole of the foot, and the patient wild with pain, countenance livid, teeth chattering, limbs trembling and lockjaw seeming inevitable, with this remedy I have produced perfect quiet, relaxation of muscles and freedom from pain, and even from soreness of the wound, in the space of 15 minutes' time. I was called in haste to see a young man of 15 years who had stepped on a nail. I found him almost in spasms and had no remedies with me. In the house I found a powder-horn, and with a piece of glass went to scraping. As soon as I had a common thimbleful I barely covered it with vinegar and heated it as hot as could be borne, and, setting others to scraping, I applied it to the wound, changed often as cool, adding the scrapings accumulated, and with this treatment had the boy easy and out of danger in 15 minutes. I know not what there is in horn that produces this effect, which I have seen many times, and have often wished there might be some preparation of this remedy a little more convenient to use than the crude material."

SPREAD OF DISEASE THROUGH THE MEDIUM OF MILK.—The spread of disease, says the *New York Medical Journal*, through the medium of milk, has often been demonstrated, but seldom more strikingly than by an investigation lately pursued by the Massachusetts State Board of Health, for the purpose of discovering the cause of an outbreak of typhoid fever that occurred last autumn in a certain district of Cambridge. It was found that all the milk supplied to the district came from one farm at New Hampshire; that on the farm there was a well into which a privy vault drained, the water of this well being used to wash the milk-cans; and, finally, that last summer a person lay sick with typhoid fever on the farm. The conclusion was unavoidable that the fever germs were carried in the milk, and thus the disease disseminated among the people of Cambridge.

NOVEL METHOD OF HEATING RAILWAY CARRIAGES.—An entirely new method of heating railway carriages from the engine is announced to be tried on a Pennsylvania railway. The principle to be adopted is similar to the air-brake principle, and considered just as practicable. An air pump forces the air along the cars for the brake system, and it is argued that plenty of heated air could be had from the fire-box of the engine. There is always plenty to spare, and, in fact, large quantities are wasted. The hot-air method would cause no danger, because, if any break occurred, there would be no possible chance of fire or explosion. Of course, if this plan is adopted, all locomotives would be equipped with suitable appliances to carry it out.

DOMESTIC ECONOMY

LEMON CAKE.—One cup fresh butter, three cups pulverized sugar, rub to a cream, stir in the yolks of five eggs well beaten, one cup sweet milk, one teaspoon soda, juice and grated peel of a fresh lemon, the whites of five eggs, four cups sifted flour, one teaspoon cream tartar. Bake in round or square pans with straight sides.

BAKED LEG OF MUTTON.—Take a leg of mutton weighing six or eight pounds, cut down the under side and remove the bone; fill it with a dressing made of four ounces of suet, two eggs, two ounces of chopped ham, six of stale bread, one onion, a little thyme, sweet marjoram, parsley, nutmeg, salt and pepper; sew up, lay in a pan and put in a hot oven; baste with butter, cook three hours.

CHOCOLATE PIE.—Take four tablespoonfuls of grated chocolate, one pint of boiling water, yolks of two eggs, two tablespoonfuls of corn-starch, six tablespoonfuls of sugar. Stir together and boil until thick like custard. Make and bake a crust, put in the chocolate filling; beat the whites of two eggs, sweeten, flavor with vanilla, spread on top and brown in a quick oven. Serve cold.

APPLE MARMALADE.—Wipe the apples well and do not pare, but core and slice them. Have ready a syrup of three pounds of sugar to a pint of water, boiled quickly for five minutes. Into this boiling syrup throw the sliced apples and boil quite rapidly for an hour, reckoning from the time of its first boiling up. Stir often. It should then be clear, jellified and rather stiff. Allow three pounds of sugar to four of apples.

BOILED BEANS WITH SAUCE.—Boil a quart of fresh young beans in slightly salted water, until nearly tender; drain and put them into a clean saucepan with half a pint of stock, some sweet herbs finely minced or powdered; a teaspoonful of sugar, and salt and pepper to taste. Stew until the beans are quite tender, then add the yolks of two egg beaten up in half a pint of milk. Stir over the fire until very hot, then serve.

STEWED CELERY.—Wash two heads of celery very carefully, trim them neatly, cutting off the outer stalks, leaves and tops, and boil them in salt and water until sufficiently tender. Drain them, and lay them in a hot dish. Have ready in another saucepan a breakfast cupful of good cream; let it boil with an ounce of butter rolled in flour until rather thick and perfectly smooth, then pour it over the celery. Grate a little nutmeg over the top and serve nice and hot. If liked, a few neatly cut squares of toast may be placed in the dish underneath the celery.

STRING BEANS, FRENCH FASHION.—Pick and string the beans and cut each one into three or four strips; wash them thoroughly, then throw them into a saucepan containing plenty of fast boiling, salted water. Boil them briskly until quite tender, then drain them into a colander. Put into a clean saucepan a quarter of a pint of milk, two ounces of fresh butter, the juice of half a lemon, a tablespoonful of finely chopped parsley, a grating of nutmeg, with salt and pepper according to taste. Stir these ingredients well together, then add the beans and toss the whole over the fire until quite hot. Serve them neatly on a hot dish with a border of croutons round about.

RUSSIAN SOUP.—Cut two large onions and a small cabbage to tiny dice. Fry this mixture in some good beef dripping until it becomes highly colored, then mix in gradually two ounces of flour; add three pints of good brown stock, and season with nutmeg, pepper and salt. Stir the soup till it boils, then draw the pan on one side and leave it for half an hour to gently simmer. Place at the bottom of the soup tureen some slices of potato fried crisp and brown and some toasted bread, cut into small dice; add a glass of white wine to the soup, and if the flavor is relished, a little chopped tarragon. Pour it into the tureen and serve.

POTATO PUFFS.—This is a most enjoyable sweet dish. Put three tablespoonfuls of milk into a saucepan, with two ounces of butter, a teaspoonful of finely minced lemon rind, and two tablespoonfuls of fine white sugar; let the milk heat very slowly until the butter is dissolved, then add, by small degrees, three ounces of boiled potatoes, dried and sifted, and beat the mixture until it is light and perfectly free from lumps; stir in the yolks of three eggs, well beaten, and just before the puffs are to be baked, throw in the whites whisked to a firm froth; butter some small patty tins, put in the mixture and bake in a well-heated oven for about 20 minutes; dust powdered white sugar thickly over the tops, and serve very hot.

SAVORY CREAM.—Peel and cut in slices a dozen large potatoes and six onions; put them in a saucepan with four ounces of butter—or three ounces of good beef dripping—a liberal seasoning of pepper and salt, a quarter of a nutmeg grated, and two quarts of white stock, or milk and water mixed. Put the saucepan on the fire and allow the contents to boil gently until the potatoes are sufficiently cooked, then rub the whole through a sieve and return it to the saucepan; stir it over the fire until quite hot again, then add half a pint of cream, or if this is not convenient, the yolks of two eggs, beaten up with a little milk, may be used instead. Stir for a minute or two longer, then serve with fried croutons of bread on a separate dish.

The Week.

Still the fairs go on and form the chief topics of interest in the several districts. This week the displays are being viewed by thousands at Petaluma, Placerville and Marysville. Next week the First District Fair, usually held in Oakland, will open at the Bay District grounds in San Francisco. Next week also are the fairs at Redding and at Grass Valley, each representing important and growing sections of the State. This week, as stated elsewhere, the Mechanics' Fair opens in this city. It is already clear that in extent at least it will be the grandest exhibition ever held in this city, and there is every reason to expect its quality will be up to the standard.

Preparations for the State Fair at Sacramento should not be longer delayed. The fair will open Sept. 12th and continue two weeks. Entries are large and exhibitors may expect good competition and active interest. The capital city is hugging a boom to her bosom and this will bring to the study of State Fair exhibits many strangers. We hope the uttermost parts of the State will send their best ma-

terials and let us have a display for the whole State, which will make the Californian proud of every inch of its area.

Admonitions of the coming of autumn appear in light showers at the north and extending southward as far as Woodland in the valley and Auburn on the foothills. Fruit-driers can get along very well without any more rain at present.

The Water and Timber Preserves of California.

A great deal has been said, yet none too much, about the great excellence of our California soil and climate. But the State possesses certain other natural advantages and sources of wealth, which, though only secondary in importance, have been measurably overlooked. Foremost among these are the timber and water supplies afforded by the Sierra Nevada. Looking at these mountains so rugged and broken, large portions of them towering into the region of perpetual snow, few persons fully comprehend the extent of the utilities here stored up for the benefit of coming generations. In the magnificent forests that cover this range, reaching up to the timber line, the future is assured of an inexhaustible supply of lumber. Inexhaustible, because these forests as fast as cut away reproduce themselves, and because the most of the land being unfit for cultivation will never be wholly cleared of its timber. These lands will therefore forever remain a great timber preserve, without any special measures being taken to set them aside and dedicate them to such use. In due time railroads reaching from the main trunks in the valleys will be built up all the principal divides, affording increased facilities for the transportation of lumber from these heavily wooded mountain-slopes to points where it is required for consumption; and thus will the whole west-lying country be assured a cheap and endless supply of this article, for these forests on the Sierra will outlive those in every other part of the State.

And the hydrography of this part of California, is there elsewhere in the world anything like it? In vain we look to other countries for such a system of lakes and rivers as exists here. And these rivers, falling thousands of feet, furnish a water-power of almost illimitable extent. This water, with such a head, can readily be made available not only for the propulsion of machinery, but also for extensive irrigating purposes, as it covers not only the great interior valleys, but also the entire foothill region of the Sierra. As much of it, too, as may be required for such use can be carried further on and supplied to towns, cities, factories, etc., wherever situated. No densely populated part of California need, in fact, ever be without an ample supply of cheap and wholesome water, this from the Sierra Nevada being of the greatest purity.

Formerly these mountain streams, owing to their remoteness from manufacturing localities, were regarded as of little importance. But now all this is changed through the readiness with which such power, through electric conductors, can be transmitted from its source for long distances without suffering material diminution of its force. If the electricians have not miscalculated their ability to so convey power we may yet expect to see machinery driven all over the State by motors located hundreds of miles away in the mountains. In this aspect of the case these interior rivers loom with an overshadowing importance. It may well be that the day approaches when water will be made to do the work that it has been thought only coal or other fuel could accomplish.

Death of Matthew Cooke.

Many readers will grieve to learn that the painful malady with which Matthew Cooke strove for about two years has at last overcome him, and his mortal remains were laid to rest in Sacramento last Sunday. Readers of the RURAL PRESS are well informed of Mr. Cooke's devoted work in the repression of insect pests, how he was really the first to come earnestly forward against the codlin moth, how he labored early and late to inform himself concerning the life history of all insect pests as fast as their work became a menace to our agriculture, how assiduous he was in answering the appeals which came to him for information, how he labored to secure effective laws for the repression of insects, and finally,

how he was first ruined in his business because he neglected it to pursue his work against insects, and then how he was prostrated by rheumatism, and though a sufferer of acute agonies, labored on to prepare his valuable publications until his hand was held fast by death. All these things are too well known to our readers to need recital, but it is fitting to say a word of earnest tribute to his memory. Most certainly his work, beginning as it did, answered a most pressing need of our agriculture. The field was new. We had good entomologists, but no good bug-killers—the man who studied the insect for the purpose of learning how to kill it was called for. Such a work could not be done without giving oneself to it. This Mr. Cooke freely did. The result was that all sought him for help, and almost day and night he labored. Soon others came to his aid, and others worked independently of him; but it must be acknowledged that he rose first, and, as is usual with pioneers, he bore the heaviest burdens and is entitled to unstinted praise.

Mr. Cooke's work remains in many forms. Of his large book, entitled "Injurious Insects of the Orchard, Field, Garden, etc.," there have been copies enough sold to pay the cost of publication, and a number of copies are on hand, the returns for which will go to the widow, who needs the funds. The book is permanently valuable and should be purchased by every fruit-grower. Mr. Cooke's smaller work, "Insects, Injurious and Beneficial," was written for use in the schools, and there is nothing now available which is better for the purpose. Mr. Cooke had also completed a series of charts for use in schools, which, we understand, have already been adopted by a number of schools. We shall be glad to have attention paid these works by our readers, either for their individual use or for schools which they may have charge of. The best work which can now be done to testify one's thanks to Matthew Cooke will be to assist his family by patronage of his publications.

Mr. Cooke came to this country in 1850, and to California in 1862. At his death he had just completed a quarter of a century of life at Sacramento. He leaves a wife and two children. His son has an ambition to carry on his father's work, and we trust he will have much encouragement and success. The name of Matthew Cooke will live in our agricultural history.

The Mechanics' Fair.

We ran through the Mechanics' Pavilion on Wednesday afternoon to see how the county exhibitors were progressing with the installation of their exhibits. Of course all was in confusion, the carpenters and painters still at work, but some notes of interest were obtained.

Nearest the entrance we found the Napa county men, with M. M. Estee and H. W. Crabb at the head, laying out a display which will occupy great space and will be given many artistic features.

Next is the San Mateo exhibit. It will be a in a rustic redwood pavilion of beautiful design, and around the pavilion there will be a railing of redwood products—pickets, vine-stakes, shakes, etc. It is evident that the San Mateo pavilion will be one of the striking objects of the fair. It is so large that a vast amount of material will be gathered under its roof, but the county will also have large spaces on the central floor for its fruit display. The committee whom we found busily at work included Charles Ashton, N. J. Brittan, H. P. Bowie, G. W. Adams, John McLaren and N. C. Carnall.

Next came a large space in which the Sonoma valley exhibit was being set up. Robert Howe, Capt. Boyes and M. K. Cady were on hand as the committee, and H. Appleton was in charge of the work.

Sonoma county exhibit, which is distinct from the above, has a large space in the "Garden." This display will be fine, as a matter of course, and will be set up in a day or two.

San Luis Obispo is represented by Mr. E. Leedham of Arroyo Grande, with a large amount of good material, which he is setting up temporarily, awaiting the completion of a new annex.

Santa Clara county is well represented by a committee of four to whom is intrusted the setting up of the exhibit. These are Mrs. E. O. Smith and R. D. Fox of San Jose, I. A. Wilcox of Santa Clara and Dr. Morey of Gilroy.

When the exhibit is in shape, another committee of four will come for a week, and so on. The plan of the exhibit, as kindly explained to us by Mrs. Smith, is varied and comprehensive. Nearest the entrance is a large canopy covering the product of the Paul O. Burns Wine Co., and next that will be a grand pyramidal display of J. H. Flickinger's canned fruit. Moody's Mills will have a flour and grain display, and the Lick Paper Mills will also have a special stand. A feature, original and unique, will be one of C. B. Bailey's Angora goats in a little octagonal pavilion covered and adorned wholly with goat-skin and mohair products. R. D. Fox will have a grand central pyramid of ornamental plants. Four fruit-driers from the Willows promise displays. The tanners, broommakers, the silk factory, the woolen-mills, J. H. Barbour with his glass fruits, the New Almaden mines with cinnabar, A. Block of Santa Clara with his large variety of pears, including his own seedlings—all these are among the contributors to be furnished space. Already the immense vegetables and the most delicately shaded jellies are appearing on the tables. The Santa Clara display will contain water as well as wine, as the Saratoga Springs will exhibit and Saratoga fruit-growers also promise a display. It is impossible thus early to specify accurately, but it is plain that the Santa Clara county exhibit will be a notable one.

We give these hurried notes merely to let our readers know what is going on. Of course, there will be many exhibits not mentioned, and a number of counties have their material still unpacked, and therefore invisible. A few days more will change the appearance of the pavilion, as our later reports will show.

The demand for space for county exhibits is so unexpectedly large this year that new buildings are being erected. For this reason one cannot tell yet what many of the counties propose to do.

QUERIES AND REPLIES.

Alfalfa or Black Alkali.

EDITORS PRESS:—Referring to Prof. Hilgard's note in your issue of the 20th, it is gratifying to me that such a high authority should indorse my theory in any respect; but if he will read over my original article, I think he will see that we agree on most, if not on all, points.

We both say that there are alkali soils that are so badly afflicted that they require the application of a neutralizing substance. He names the substance "gypsum," while that was what I referred to but did not name, as I did not propose to treat of such soils, and so stated, "leaving them to future generations to conquer."

Nevertheless it may be of interest to show that even the black alkali soil will produce. With this I send you a sample of alfalfa that grew in such soil, and that has been handed me by the gentleman on whose place it grew. I also submit an analysis of the soil in which it grew, which analysis was made at the University, under the supervision of Prof. Hilgard. By the analysis you will see that the soil is quite badly afflicted with black alkali (carbonate of soda). It is moreover of a clayey, putty-like character, that cannot be plowed when wet, as it simply packs on the mold board every few feet, and the ground bakes like cement when flooded.

The land was plowed dry and the seed sown in the month of January, and the plants pulled out of the ground in the month of June of the same year. Considering that this sample has been drying for over a year, and during that time has been handled and examined 100 times, it certainly shows a remarkable and healthy growth for the time and circumstances.

This sample is a remarkable corroboration of the truth of my theory, as will be seen at once, when it is known that it grew on the banks of a ditch above the water-line, while all the alfalfa that was in the checks and was flooded in irrigating was killed completely. I am, moreover, informed that though the land has been entirely neglected—in fact, abandoned, the alfalfa was still growing on the ditch banks in June of this year, and that, too, in spite of the fact that the jackrabbits kept it gnawed close to the ground. And I will venture to assert that it will continue to grow in so far as the rabbits will permit it to do so.—RECLAIMER.

[The analysis shows 2.725 per cent of carbonate of soda. The growth of alfalfa is about two feet in height and well rooted.—EDS. PRESS.]

RAILWAY INVESTIGATION.—The United States Court has decided that the Pacific Railway Commission has no power to compel a witness to answer the questions put to him. We rather expected that it would so decide.

Capping Flowing Wells.

[Written for the RURAL PRESS by A. BORE.]

There are in this State many hundred flowing artesian wells. From most of these the water, for the greater part of the year, runs utterly to waste. This is notably the case in the great artesian belt of Kern and Tulare counties. Some of these wells flow as high as two and a half million gallons a day, and it is safe to say that from them all there is an average waste of water per day of fully 100,000,000 gallons.

This water is not only unutilized, but is in its uncontrolled state a nuisance of great magnitude, as it covers large tracts of land, converting deserts into marshes, and finding its way into shallow sloughs with which the country abounds, crosses the roads in innumerable places, making travel and transportation both difficult and dangerous.

This is not only contrary to equity but to the law, as there is a State statute requiring such wells to be capped when not in actual use. Practically, the law is a dead letter, as it is never enforced, and the nuisance continues to grow, until it will quite soon reach immense proportions; such that, for the safety and prosperity of the artesian belt, the law will have to be invoked.

The object of this communication is to direct the attention of such of your readers as may be interested to the prime importance of capping all flowing artesian wells. With this I send you an illustration of the manner in which this has been done on the great well recently sunk for the Miramonte colony in Kern county.

The illustration shows clearly what is above the ground; below it is arranged, as shown in the diagram, as follows:

In beginning work on the well, a 10-inch casing of galvanized iron, riveted and soldered at all joints so as to make it water-tight, is put down into the ground 40 feet. Nine feet underground is riveted to the outside of this casing a cast-iron collar and flange. On top of this, and extending outward from the casing on all sides, forming a diameter of about four feet, is run a block of concrete eight inches to a foot thick. This serves as an anchor to hold this casing in the ground against the pressure of the water when the well-cap is closed. On the top of this 10-inch casing is a flange and collar, to which is fastened a regular water-valve gate, as shown in the illustration, and an elbow of cast iron on top of that to divert the water in any desired direction. Inside of this 10-inch casing is started the regular eight-inch well casing in two-foot joints, and the well put down to its required depth, and the space between the 8-inch and the 10-inch casing filled in with sand and cement.

By the illustration it will be seen that in the side of the ten-inch casing, and of course opening into the eight, is a smaller connection which may be from one to three inches. A pipe connected with this and carried underground will lead the water in any direction and to any desired point or points, such as a dwelling-house, barn, corral, watering trough, etc.

As there is a heavy pressure of water in the well casing when the cap is closed, the water is carried in this pipe under that pressure.

I do not know that anything more can be added to the above description and illustration. It tells its own story, which would certainly be an eloquent one to any person who has had experience with flowing artesian wells.

In the outline engraving, A is the eight-inch elbow of cast iron; B is the water cap or gate, also eight-inch; C is the gate flange; D is the ten-inch casing; E is the small connection and pipe; F is the anchor of concrete; G is the cast-iron flange; H is the eight-inch casing; and I is the sand and cement between the casings.

HERE AND THERE.—Acknowledged stagnation, says a cotemporary, in almost every industrial line in Europe contrasts most singularly with the great activity everywhere apparent in the United States. European nations are warlike and ruled by monarchs who use men as mere tools to further monarchical ends and ambitions. The United States are peaceful States ruled by the people for the people. Europe is squeezed to financial death to maintain her great armies. In the United States there is practically no army. European nations use iron and steel largely in making murderous weapons and impregnable armors for costly warfare. In the United States the main use of iron and steel is in the interest of peace.

Fruit Notes in Vaca and Pleasant Valleys—No. 2.

[Editorial Correspondence.]

We dropped our itinerary at Mr. Thissell's to make a digression on the subject of handling the peach crop, which we desired to bring immediately to the knowledge of our readers. We return now to the course of the narrative. We have already hinted at the desirability of Mr. Thissell's picturesque situation for fruit.

PERSPECTIVE VIEW OF FLOWING WELL WITH CAPPING ATTACHMENT.

He has trees which he planted as far back as 1857, and he has extended his plantation until now at the home place he has 120 acres in fruit, and at another place, which he and his son own jointly, there are 60 acres in fruit. The

We found Mr. Henry Brinck at home, but unspeakably busy, with his large gang of fruit-pickers, for the Brincks are shipping East not only the bulk of their own crop, but some from their neighbors. Fruit to fill five cars went

SECTIONAL VIEW OF ARTESIAN WELL SHOWING ANCHOR, CASING AND CAP.

fruit-grower who visits Mr. Thissell will probably be most interested in the very excellent seedling fruits which have come into notice through his efforts. Of these are the Thissell seedling apricot, which Mr. Thissell and his neighbors grow as the earliest good apricot, ripening just after the Pringle; the Muir peach, which is known to our readers for its peerless drying qualities; and the Lovell. We saw acres of three and four-year-old trees of these two varieties—perfect pictures of abundance in the crop they were then carrying. The Muir

ripens between the Early and Late Crawfords, and the Lovell comes in after the Late Crawford.

But our visit at Mr. Thissell's, with its many entries in our note-book, which we cannot touch at this time, came to an end at last and we turned our course southward. Adjoining Mr. Thissell on the south is the large and well-equipped orchard and vineyard property of H. & W. Brinck. They have 150 acres in trees and vines and have been in the valley 14 years.

of smaller places which we had not time to visit, but their thrifty trees and neat dwellings could be clearly seen from the road on the warm hillside. Of this group of small holdings, F. N. Wirtner has 15 acres; T. D. Parker, 10 acres; W. H. Austin, 5 acres; H. P. Austin, 15 acres; W. D. Rhodes, 30 acres. We especially note these smaller places, for we believe the time will come when these valleys will have many times their present population, and hosts of families will enjoy a good living from small places.

Passing along through Pleasant valley, we stopped a few moments at the ranch of J. M. Pleasant. Mr. Pleasant with his son, W. J. Pleasant, came into the valley very early and began fruit-growing as early as 1852. The first enterprise was the planting of peach pits, some of which cost 25 cents each at Younts in Napa county, and others were brought from Kentucky. W. J. Pleasant has peach trees from Kentucky pits planted in 1856, which are still vigorous and thrifty, and most of them were long ago grafted over to good varieties. Mr. Pleasant says he sees no signs of death from old age in the trees; where they show weakness, it has resulted from ill treatment. We climbed to a bench about 75 feet above the floor of the valley where Mr. Pleasant's orange orchard is located. He has about an acre of trees 15 to 25 feet in height and laden with fruit which ripens early and is profitable. We mentioned last week Mr. Pleasant's method of lye-peeling of peaches. J. M. Pleasant we found very busy in building a peach-pitter and spitter of his own design, which he was in haste to have tried before the peach crop was disposed of. We shall be glad to hear how it works.

There were other places in the neighborhood which we would like to have visited, but it was getting late and we had to drive for shelter. Mr. Wash. Johnston's fine residence looked very handsome amid its environment of trees, and on the hillside on the east Mr. Chas. Martel's orangery and famous Tokay vineyard were spread out to the last rays of the sun. Farther southward is the place which Mr. J. S. Shearman has lately vacated to transfer his energies to the upbuilding of another county. Next came G. T. Robinson's. In the distance, on the western slope of the eastern hills, the places of W. Cantelow, Fred. Rogers and Nathan Rogers could be seen in the twilight and were mentally chalked down for a visit at another time, which, we trust, will not be long delayed.

At this point in the valley it became too dark for further sight-seeing, and thoughts of rest and refreshment suggested themselves. We took tea with W. R. Nutting, who is occupying a house in the orchard of F. Herbert Buck, and doing some excellent photographic work, illustrative of the progress and natural beauties of the valley. That night we were given a kindly welcome at the fine new residence of Frank McKevitt and hospitably entertained. In the morning we had the pleasure of looking through Mr. McKevitt's vineyard and orchard. The former was one of the most interesting 20 acres we saw in the valley, because of the data it offers to the student of *vinifera* varieties upon the *Vitis Californica*. Mr. McKevitt finds that some varieties do exceedingly well on this root, notably the Chaselas Fontainebleau and the Folle Blanche. Some varieties, as the Tokay and Cornichon, largely overgrow the root, but are still growing and bearing well. Mr. McKevitt has had a Tokay graft six months from grafting bear a six-pound cluster. He grows table grapes only. The variety in growth of the seedlings of *Californica* upon which he has grafted the *vinifera* has given him opportunity of interesting study, and he has learned to recognize the source whence he obtained the roots by their different behaviors. Mr. McKevitt could write us a most interesting and valuable letter on his observations and experience with the *Californica* stocks, and we hope he will find time to do it when the hurry is over.

We next visited A. McKevitt, whose place joins his son's, just noted. Mr. McKevitt and his son have both become horticulturists since their coming to California a few years ago, and they have certainly made most rapid progress in the art. Their name is indelibly fixed in our horticultural annals by being affixed to a most excellent seedling peach—McKevitt's cling. It was first noticed and propagated by M. R. Miller, of whom Mr. McKevitt bought the place. Mr. Miller did not wish to make it

from their packing-house from a Wednesday to the following Monday. Besides this work, a large spread of dried fruit could be seen out in the peach orchard. Mr. Brinck speaks highly of the Austin cling peach, originated by one of his neighbors, H. P. Austin—a large yellow cling, ripening after the Salway. The buildings (barn and house) on the Brinck place are new and excellent, and the whole establishment has a prosperous look about it.

A little back from the county road, and upon the hillside easterly from Brinck's, is a group

known, but Mr. McKevitt, when he bought the place, decided that if the peach was good for him it was good for his neighbors, and they were welcome to it. In return for this favor, the neighbors named the peach after him. The peach originated, it seems, in the apricot orchard, and Mr. Miller had secured about 50 trees of it when he sold out. It is described as one of the finest white clings—white to the pit. The tree is vigorous, free from curl, has but little mildew and is a heavy and regular bearer. Mr. McKevitt has also Miller's seedling, a white cling, coming two months later than the McKevitt. It has been sent East as late as the last of October and has brought good prices. We found at Mr. McKevitt's a very neat packing-house, 24x32, two stories. The lower floor has doors which fold outward, so that nearly the whole north side can be thrown open if desired. The south side has a continuous window, closed by a long blind hinged along the top, so that it shuts out the sun when raised to admit light. Thus a light and cool packing-place is secured. Upstairs there is a large room for storing and packing dried fruit, of which a good large amount was on hand at our visit. The house cost about \$500, and was well finished with rustic. It struck us as well adapted to the needs of a medium-sized orchard.

During the morning we drove through the extensive orchards and vineyard of Senator L. W. Buck, but the owner was at Sacramento, attending to the management of the Fruit Union. Senator Buck's place is one of the finest and most noted in the valley. One of the most obvious features to the passer-by is the grand avenue which he has made by planting both sides of the county road with California black walnuts. Mr. W. W. Smith has a long row on his line at the county road. This sort of planting should be more general. The roads in the valley should be macadamized, shaded, and sprinkled. As it is now, the roads are about as bad as they can be.

At John B. Carey's we found a busy scene at peach cutting, as mentioned last week. Mr. Carey has 26 acres in orchard, mostly trees just come into full bearing, and a fine-looking lot of trees they are. He has 200 New White nectarine trees, four years old, which yielded him this year over three tons of dried nectarines—a most beautiful fruit.

Our next call was at the large ranch of J. W. Gates, in Gates canyon, a fine arm of Vaca valley on the west side thereof, the canyon opening southward and securing fine exposure. Mr. Gates has lately been won over from live-stock to horticulture, and he is showing great adaptation to the fruit business. We found at his place a fruit-grader which seemed to us to have particular merit. Mr. Gates contracted his peaches and other fruit to the Benicia cannery for several years at good prices, but cannot deliver fruit below a specified size. How to select them gave him much trouble until he devised his grader. It consists of a box about 3x7½ feet wide and long, set on legs in such a way that one end can be raised more or less to secure whatever slant is desired. About midway between the top and bottom of this box is fixed a grating of adjustable bars, very ingeniously contrived. At the bottom is a cushioned end against which the fruit rolls. In operation the fruit is poured from the baskets upon the upper end of the bars, and the slant sets it to rolling down the bars, and all below the size at which the bars are set will drop through and roll into the box for culls, while the full-size fruit rolls down on top of the bars to the boxes in which it is sent to the cannery. The arrangement is such that it could be set to grade very small or large fruit. Mr. Gates has a new peach which he thinks much of. It has been named Grover Cleveland, and is a light-yellow cling of uniformly good size, clear to the pit and the pit small, good flavor, and the tree a great bearer. The seedling originated on Mr. Gates' place, and he thinks so well of it that he is growing it largely.

After leaving Mr. Gates, we drove to J. A. Webster's place near Vacaville. Here is a splendid group of orchards just coming into fruit on land formerly in the Pierce estate. We wanted to call on a number of orchardists in this district, but could not find time to do so. At Mr. Webster's we found his No. 2 Acme steam drier being run to its full capacity, using about a ton of green fruit, and producing a very fine evaporated fruit.

Adjoining is the 60-acre orchard of Henry

Bassford. Mr. Bassford has had an exceedingly busy season, and his packing-house is one of the notable places of the region. He has shipped a vast quantity and his dried peaches and nectarines will amount to 40 tons. He has employed 60 hands steadily during the packing and cutting season. He has 18 acres of shipping grapes and about 40 acres of peaches and nectarines. At the packing-house we met F. J. Bassford busily engaged in packing Muscats for the East. He has the handling of his own and R. A. Campbell's crop and has his hands full.

By the time we finished at Mr. Bassford's it was time to drive to Vacaville to take the Saturday afternoon train, and we were obliged to postpone further sight-seeing in the Vacaville district until another opportunity.

ENTOMOLOGICAL.

The Use of Hydrocyanic Acid Against Scale Insects.

University Experiment Station, Bulletin No. 78.

NOTE.—As stated in a previous University Bulletin (No. 71, June 12, 1887), a special investigation was undertaken by this station at the request of orange-growers of San Gabriel, Los Angeles county, to determine the practicability and efficiency of gaseous insecticides. The results obtained were so satisfactory that the orange-growers who bore the extra expenses of the first experiments urged the advantages of continuing the work, and the Board of Supervisors made an appropriation to cover expenses, the work to be done under the auspices of the County Horticultural Commissioners. For this reason the following description of later experiments and their results takes the form of a report to the local authorities of Los Angeles county.

To the Board of Horticultural Commissioners of Los Angeles County—GENTLEMEN: I herewith transmit a preliminary report of investigations, carried on at your request, relating to the use of gas as an insecticide against the cottony cushion scale insect (*Icerya purchasi*). The work was a continuation of that carried on some time ago, and consists mainly in devising means for the easier application of the gas which was found by the earlier experiments to be the most efficient.

In resuming the work, to carry out the general principles of application as set forth in the last report, it was found necessary to vary considerably the form of apparatus and preliminary preparation of materials, for the purpose of increasing the rapidity and certainty of application. A fan-blower capable of carrying a heavy volume of wind replaced the pump previously used, and this necessitated a change in the form of the generator.

Many experiments were made to determine the most convenient methods for using the chemicals. The old way of mixing the soda and cyanide in the generator was found to be too slow and uncertain to be practicable. Often a heavy crystalline coating formed around the mixture and prevented complete action when the acid was added; again, when the two salts were not mixed, the usefulness of the carbonate as a protection to the foliage was often lessened. In order to avoid this difficulty, it became necessary to reverse the order of application and inject slowly the salt mixture upon the acid, as given in the directions below.

An attempt was made to use each ingredient separately, the soda being in a solid form, but the same difficulties of uncertainty and slowness were experienced.

The generator, in general terms, consists of a sheet-iron cylinder, or tank, held between two pieces of plank, one of which forms the cover, and the other a movable base which is carried up and down by an eccentric placed beneath. The cover holds two receivers (one for the acid and one for the cyanide and soda) and two tubes opening into the exit pipe which passes over the generator from the blower. A heavy volume of air, carrying with it the gas, is forced by the blower into the tent through a 3½-inch pipe, and after diffusing is again carried back by a similar pipe to the blower, thus establishing a continuous circulation and stirring up of the gas during the treatment.

In the pipes leading to and from the tent are two joints—one at the elbow close to the generator, used as a disconnecting joint when the apparatus is moved; the other, about three feet from this point, is used as the disconnecting joint when two tents are worked with the same generator, and becomes only a flexible joint when one tent is used; the former in this case becomes the disconnecting joint. The opening of the injecting pipe is covered with a perforated cap which distributes the gas when pumped into the tent.

The tent for covering the tree is made of heavy bed-ticking, thoroughly oiled with linseed oil. This cloth serves the purpose best, as it is very closely woven, is pliable and easily folded. Practice has shown that much labor and time can be saved, and less injury done to the tree, by having a tent which passes easily over the tree, with cloth enough to make a close connection at the bottom with the earth. The cloth is folded out at the bottom rather than folded in, as in the older treatments, and its margin covered with dirt, thus increasing

the area of soil treated without materially increasing the volume within which is to be filled with gas.

The tent should be made somewhat bell-shaped, having a "flange" at the bottom of sufficient size to move outside of the main tent at all times, and should fold over like a glove when the tent is removed. It should also be large, so that the points of attachment of the side guy ropes may be drawn close to the pulleys in the corners of the frame; thus, when wide-spreading trees are to be treated, the tent can easily be drawn over any branches included within the frame.

"The support of the tent, devised by Mr. Titus, is a very ingeniously contrived scaffolding mounted on wheels, which serve to move it from one tree to another. Its dimensions are 26 feet high, with a base 20x20 feet. Its upper part is 20x12, and carries upon the top a roller made of galvanized iron (6 inches in diameter and 12 feet long), upon which the tent is rolled when taken from the tree. Side guy-ropes are attached to the bottom of the tent and run through pulleys at the upper corners of the scaffolding. They are used to open the tent when it is to be dropped over the tree, and to fold it up when it is removed. The lightness of the apparatus allows of its being easily removed by two men, who operate the whole. If necessary, two or more tents can be handled by the same scaffolding, one tent being left over the tree while the scaffolding is moved to the next."

Later experience shows that it is advantageous to have a frame for each tent, with one generator to supply the gas for two tents. Such an arrangement can be handled by one crew of men without loss of time.

Acid.—Much of the success of the operation depends upon the use of acid of the proper strength, and it should be specially urged that the acid be of the strength recommended in the table of doses given below. This any workman can determine by the use of a Baume hydrometer, which can easily be procured with sufficient instructions for its use. If the acid is not of the proper strength, the table below will show the amounts to be used corresponding to the degrees indicated by the hydrometer. Thus, if the acid only shows 50°, use the column marked 50° Baume in place of that of the 65° in the regular prescribed doses of acid.

DOSES OF ACIDS OF DIFFERENT STRENGTHS.

Size of Tree. Feet.	65° Baume.	60° Baume.	55° Baume.	50° Baume.
5	.9	1.1	1.2	1.3
6	1.6	1.8	2.1	2.3
7	2.6	2.9	3.3	3.7
8	3.8	4.3	4.9	5.5
9	5.5	6.2	7.0	7.8
10	7.5	8.5	9.6	10.7
11	9.9	11.3	12.7	14.2
12	12.9	14.7	16.5	18.4
13	16.5	18.8	21.1	23.6
14	20.5	23.3	26.2	29.3
15	25.3	28.8	32.4	36.2
16	30.7	35.0	39.3	42.9
17	37.8	43.0	48.4	54.0
18	45.7	49.8	55.9	62.5
19	51.3	58.4	65.6	73.4
20	60.0	68.4	76.8	85.8

Soda.—It is best to use the bi carbonate instead of the neutral carbonate of soda. It should be finely pulverized, and can be conveniently measured in a can which will hold one pound and fractions of a pound.

Solutions.—The cyanide of potassium solution (not the "mining cyanide") is prepared by dissolving the salt in the proportion of ten pounds to two gallons of water. Place the cyanide in the vessel in which you wish to make the solution and add the water to it, bring nearly to boiling with occasional stirring, and let it cool. It is best to make the solution one or two days before using, in order to avoid as much as possible the stronger odor of a freshly prepared solution.

In the prescribed dose an excess of acid has been recommended, in order that complete action shall always take place. It is desirable to test the residue occasionally to be satisfied that the work is complete. This is done by adding a little more acid and noting whether boiling or effervescence takes place upon stirring; care being taken not to mistake the effervescence from the material accidentally gathered on the sides of the cylinder during the operation, for that of material which should have been acted upon in the bottom of the cylinder.

Doses According to Size of Tree.

The regulation of the doses for the different sized trees so as to produce uniform treatments is calculated on the basis of the results of the experiments which determined the amount of each constituent for a 12-foot tree. The following table indicates the amounts for trees of different dimensions of top, based upon the rates of cubical contents.

The amount of material for each dose differs from that previously recommended (Bulletin 71) by a decrease of one-fourth in the amount of soda and a slight change in the acid; the cyanide remains the same. Varying amounts of soda were used showing quite clearly that a decrease of one-fourth was possible, but farther than this an appreciable lessening in the preservative effect was noticeable.

Size of Tree. Feet.	Cyanide of Potassium. Fluid ozs.	Bi-carbonate of Soda. Pounds.	Sulphuric Acid. Fluid ozs.
5	1.6	.1	.9
6	2.5	.2	1.6
7	4.0	.3	2.6

8	6.0	.4	3.8
9	8.5	.5	5.5
10	11.5	.7	7.5
11	15.5	.9	9.9
12	20.0	1.1	12.9
13	25.4	1.5	16.5
14	31.6	1.9	20.5
15	39.2	2.2	25.3
16	47.5	2.6	30.7
17	57.5	3.1	37.8
18	67.7	3.8	43.7
19	79.9	4.4	51.3
20	90.5	5.2	60.0

The prescribed doses for small trees will be found too small, unless the trees are very low. The calculations are all based upon the supposition that the trees are nearly spherical in shape; but in most cases it will be found that the trees of small dimensions have most of the branches raised fully four to five feet from the ground, thus leaving a large volume on the inside of the tent unoccupied. Due allowance must be made when the height of the tree is so much greater than its diameter.

Mode of Operating.

Place the desired amount of acid in the acid receiver, then put the required amount of soda in a convenient vessel (a gallon measure serves the purpose well) and add water to bring it to a thin paste, stirring well to get rid of all the lumps, before the cyanide solution is added. Mix the cyanide solution and the soda paste so that the undissolved soda will remain evenly distributed through the mixture. Pour into the cyanide receiver and allow it to run slowly and regularly upon the acid which has previously been run into the generator. As soon as the cyanide solution begins to enter the generator, the blower should be turned slowly and continued until all the material is run in and violent action ceases. This usually takes a minute or so after the materials have united. Then follow with violent blowing for a minute or so and allow to rest until about 15 minutes from the beginning of the treatment, when, violent blowing is repeated for one minute. The time occupied in running in the mixture should be about as follows for the different sized trees:

10-foot tree	4 minutes
11 "	5 "
12 "	5.5 "
13 "	6 "
14 "	7 "
15 "	7.5 "
16 "	8 "
17 "	9 "
18 "	10 "

It is quite important that the time of injecting shall be closely observed, and should be lengthened rather than shortened. No time will be saved by hurrying this part of the treatment, for if run in too fast lumps will be formed which will take some time to be completely acted upon by the acid. If the time is slightly lengthened no serious results will follow. Some of the largest doses have been completely acted upon in less than 15 minutes, thus making it possible for a single generator to serve two tents when the prescribed time of exposure is adopted. It is advisable to continue the treatment of a single tree for about 30 minutes, although the time may be slightly shortened when two tents are used.

Injury to Foliage.

It was plainly noticeable that under the influence of the direct sunshine much more burning of the foliage took place. Trees, which were treated in the forenoon of hot days, were burned mostly upon the east side, and this injury to the foliage appeared always upon the side of the tree which was exposed to the sun at the time of the treatment. The injury was undoubtedly done while the tent was upon the tree, and did not result from burning after the tent was removed.

Trees which were treated early in the morning or late in the afternoon remained perfectly unharmed. In one case the temperature in the shade was about 92°, while within and close to the sunny side of the tent the temperature reached 108-110°.

This injury to the tree may be lessened somewhat by covering the frame with a cloth which will shade the tent; but it will be found more convenient to make the treatments with the gas in cooler seasons of the year, or in the cooler hours of the day. When injured by exposure to sun-heat the leaves drop off, but without injury to the green woody stems; fresh shoots have appeared in the course of three weeks after the treatment.

The prospects of effective treatment of scale insects by this method are quite promising. The gas is not only deadly to the insects but kills also the eggs, notwithstanding they are confined in the cottony cushion sac of the insect. The effect of the gas is equally deadly to the white as to the black and red scales.

Due attention should again be called to the extreme care which must be exercised in handling the gas on account of its highly poisonous properties; this warning cannot be too strongly urged. But it has been shown by practical operation that no special danger threatens the operators if due care be taken.

The limits of a preliminary report preclude a detailed description of the apparatus used in the operation. It is recommended that those who are interested in the construction of a machine shall, if possible, make personal examination of the working outfit at San Gabriel, and thus learn by actual observation the method of construction and operation.

F. W. MORSE.
Berkeley, Aug. 27, 1887.

MILLER'S LIGHTNING HAY PRESS.

With Important Improvements for the Season of 1887,

Adding Strength, Speed and Durability.

CAPACITY, THIRTY TONS PER DAY,
Or with Unskilled Labor from 16 to 20 Tons.

IT IS THE BEST PRESS IN THE WORLD FOR
ALL KINDS OF WORK.

This Press received the Silver Medal at the Nevada State Fair, also Gold Medal at California State Fair, 1884, and won the \$50 contest money, with three competitors, at the State Fair of 1885, and First Premium in 1886, and

Challenge the World for Speed and Good Work.

Patented May 26, 1885.

MANUFACTURED BY THE

We Claim for the Lightning Press,

1. No tramping.
2. No forking from the stack.
3. No cutting of stacks necessary.
4. You can sit at a 100-foot stack and bale it all without a move.
5. It makes the best bale in the market.
6. You can put 8 tons of good hay from the loose Baling Press in a car.
7. The forking from the stack is all done by the team working the Press.
8. The piling of bales can be done by the same animals.
9. The baler can turn out more hay in less time and in better shape than any other Press.
10. It is the cheapest Press for the baler. It costs but 15 cents per ton to board the men.
11. It does not break the hay or damage it in any way.
12. It is the best Press for the warehouse man.
13. It takes less rope or wire to bale a ton than any other Press.
14. It is easier on a team than any other Press.
15. It is the easiest Press on men in the world.

STOCKTON COMBINED HARVESTER & AGRICULTURAL WORKS, Stockton.

Some of the Many Testimonials we have Received:

DEAR SIR:—We are baling 20 tons a day on an average. Yours,
HANK DOHM, Brighton.
DEAR SIR:—Your Press has given entire satisfaction in our neighborhood, and we have baled 27 tons per day with it. Respectfully,
WARNICK & SHERWOOD, Elk Grove, Cal.
DEAR SIR:—You wished to know how we liked the Press—we are well satisfied. We are baling 20 tons per day. The old-fashioned man-killers have all gone into winter quarters in our neighborhood.
FERGUSON BROS
Woodland, Yolo Co.
DEAR SIR:—Yours of a late date at hand making inquiry how we like the Press, and will say in reply that we are baling 130 tons per week, and I am well pleased with the Press. Yours truly,
J. S. GRIGSLEY,
Yountville, Napa Co., Cal.
DEAR SIR:—I am well pleased with the Lightning Hay Press. We are averaging 18 tons per day. It makes the best bale I ever saw. I am yours truly,
P. D. GUNTER, Sacramento, Cal.

DEAR SIR:—We have concluded to keep the Press. We have earned half the price of it in the last 12 weeks. We have baled 1500 tons of hay. F. C. LUSK, Administrator, Jacinto Ranch, Estate of H. J. Glenn.
DEAR SIR:—When will you have a Lightning Hay Press in our neighborhood? We do not want any other Press to bale our hay. Yours,
J. L. HUNTOON, Sacramento, Cal.
DEAR SIR:—The Lightning Hay Press is the handiest and easiest operated of any Hay Press I ever saw. Respectfully,
JOHN LEIGHT, Pleasant Grove, Sacramento Co.
DEAR SIR:—You have scalped them all on hay presses. I would not give \$10 for the best press in California to use, if I could get a Lightning Press. Yours,
HON. THOS. McCONNEL, Elk Grove, Sac. Co.
DEAR SIR:—I want a Lightning Press to bale our hay. Will give 25 cents per ton more to have it baled with your press than any other. Very respectfully,
R. S. CAREY, Pres. Sac. St. R. R. Co.

We make a Press that you can put 10 tons in a car; the bale is 18x26 inches wide by 44 inches long; the car will take two bales endways and four bales high.

The Lightning Hay Press, when well worked, is capable of baling more hay in less time and in better shape than any other Press made; has often turned out, in the hands of skilled balers, 30 tons per day.

It will be seen by the accompanying cut that the Press stands upright when baling, and uses a drop to pack the hay chamber before pressing.

The Press is provided with a Derrick (not shown in the cut), to which is attached a fork, by means of which the team working the Press deliver the hay from the stack or mow to the Press for the feeder.

The team is worked by one continuous forward movement in a circle, making but one stop to each bale, while tying and discharging the bale from the Press.

The feed opening is 3 feet 10 inches wide, by 4 feet high, and is provided with large side-boards and feed apron that keeps the feeder employed preparing for the next bale while the bale in the press is being tied and discharged, thus making it a perpetual baler.

THE LOOSE BALING PRESS

Will make a bale 3 feet 10 inches long, 26 inches high, by 24 inches thick, and weighs from 225 to 275 pounds, according to the condition of the hay.

Presses Making Other Sized Bales will be Furnished When Wanted.

The Press is easily moved. When moving, the ground sills are swung under the wagon with windlasses on both front and hind gear, the upright part is hinged to the horizontal sills, and laid down when moved, and raised to work by means of a windlass attached to the Press for that purpose. It can be easily loaded by two men in 20 minutes, ready for the road, and set up ready for work in the same length of time.

The Press requires four men and two animals to operate it to do rapid work.

This Press will be on Exhibition at both the State Fair at Sacramento and District Fair at Stockton.

Send for Circulars. Correspondence solicited. For further information, etc., address

HARDWARE and AGRICULTURAL IMPLEMENTS.

GEM SEED SOWERS.

No. 1, Weight, 130 lbs. \$20.

This Machine is run with a Chain and Bevel Gear. It is the one we have sold for years, and has given the best satisfaction of any broadcast seeder yet invented.

No. 2, Weight, 154 lbs. \$22.50.

Runs with Chain and Belt Gear. The advantages gained on the bevel gear are smoothness of movement, noiseless while running, durability of the fast-running parts, and the evenness with which it sows the grain.

No. 3, Weight, 164 lbs. \$25.

Runs with all Gears. This machine is preferred by many to the others which run by Chain. The feed valves and distributor are the same as in the others.

We have manufactured the GEM SEEDERS for a number of years, and they have given better satisfaction than any Broadcast Seeder in the market. They throw the seed horizontally instead of vertically, and thus save a large portion of the grain. Where sold they have never failed to give satisfaction. ARMSTRONG'S PATENT FORCE FEED is attached again this year, and is considered by those who have used it, a great improvement.

THE GENUINE GEM SEEDERS are manufactured exclusively for us at Benicia. SEE THAT OUR NAME IS ON THEM.

CENTRAL ARIZONA.

[NUMBER I.]

(Written for the RURAL PRESS by O. C. WHEELER, LL.D.)

Introductory.

Arizona Territory, as now bounded, contains an area of 113 967 square miles. Within its boundaries are 80 rivers and small streams, and 20 lakes and ponds, having a water surface of 100 square miles, leaving a land surface of 113,867 square miles. It is therefore larger than all New England and the State of New York combined.

The Sierra Nevada and the Rocky mountain ranges terminate within its boundaries in a vast conglomerate of separated peaks and cross-ranges, running, for short distances, in all conceivable directions, and of the most fantastic shapes, covering the northern half of its surface. This, by general average, has an elevation of some 6000 feet, constituting a vast plateau from which there rise some lofty peaks and a great number of more moderate elevations, some of them covered with valuable pine forests, while intervening depressions are covered the year around with nutritious grasses capable of sustaining live-stock of every kind, and in great numbers.

The southern portion of the Territory, from the 34th parallel, is less elevated, by from 3000 to 4000 feet. In general terms it is an extended plain, traversed by several streams, and frequently pierced from below by sharply angular, rocky hills and mountain ranges of limited extent.

Throughout the Territory such deposits of the precious metals are found as to warrant the opinion that it is the richest mineral country of equal extent to be found on the globe. Its natural divisions are in three sections, Northern, Middle and Southern. The present, and a few succeeding articles, propose to treat, in a brief and concise manner, of the section known as Central Arizona.

Geography and Topography.

The district usually denominated Central Arizona includes Maricopa county, with portions of Gila and Pinal counties, and lies between 32° 30' and 34° north latitude, and between 34° and 36° of longitude, west from Washington, containing an area of something over 10,500 square miles (more than 900 square miles larger than the States of Connecticut and Rhode Island combined), of irregular, oblong form, its length lying in an easterly and westerly direction. It is in one sense a vast plain, elevated some 1500 feet above tidewater, and yet, with the exception of the valley of the Salt and Gila rivers, is freely studded with peaks and short ranges of mountains mostly composed of dark basaltic rock, rising from 100 to 3000 feet above the general surface. Many of these elevations bear, from base to summit, considerable quantities of shrubbery and timber, so that while the general aspect is that of a broken and rude country, the view is relieved with large quantities of evergreen foliage. Between these short ranges, and surrounding these irregular peaks, are valleys of sandy surface and forbidding appearance, covered with a great variety of cacti (some of which attain a height of 30 feet) and other kinds of semi-tropical growths and occasional lakelets that disappear for at least one-half the year, and creeks that, though full for several months, are during the balance of the year dry. But it has been demonstrated that all these valleys, when irrigated and cultivated, are extremely fertile, and many of them so sheltered and protected as to have a climate equally tropical with ordinary districts located 10° further south.

Prominent among these is the Salt River valley, about 50 miles long from east to west, and from 8 miles to 20 miles north to south, aggregating an area of about 550 square miles, or, in round numbers, 350,000 acres; and occupying a central position in Central Arizona. Something over 200,000 acres of this valley has a surface of incomparable smoothness, with a very gentle slope to the south and west, and is thus, by nature, better fitted for irrigation than any other tract of equal extent we have ever seen.

Geology and Mineralogy.

The geology of Central Arizona has thus far received very little really scientific attention, though very much has been said and not a little written on the subject. Yet enough is already known to assure the real student that there are materials of almost countless variety and value, inviting profound research, and promising rich reward to the toiler in the golden science, extending far beyond all previous developments as now found in the books on geological science. The larger mountains are of granitic formation, mostly, and so are many of the smaller ones. And yet there are so many and such distinct traces of gneiss, and of clay, and of micaceous and talcose slates, that the explorer is ill prepared to give any very definite descriptions until time has afforded opportunity for further investigations and more scientific research.

This much, however, is apparent, even with the present crude and limited amount of development, that the geological formations of

this district are (geologically speaking) of very recent origin. For, though the upheavals and the detritic deposits are said to expose geological strata 25,000 feet thick, and although all the geologic formations known to exist on the western continent, including the drift and tertiary periods, are here found in their regular order, there is good reason to believe that most of them are less than half a million years old.

The Mineralogy of Arizona.

Consisting as it does of one of the richest mineral belts in the world, has been the subject of very rapid and somewhat thorough research, and hence is far better understood than its geology.

In the richness and variety of its mines, Arizona is the peer of any State in the Union or any country on earth. Though but partially developed, the products of her mines fully justify the statement that as a producer of the precious metals she has no superior. Within the district called Central Arizona there are numerous mountains that abound in mines of gold, silver, tin, nickel, cinnabar, lead, platinum and iron. The latter is of superior quality and adapted to the production of the finest steel. Gypsum, salt and other mineral springs containing sanitary ingredients of great potency, together with natural loadstones of high magnetic power, vast fields of bituminous coal, red, white and yellow garnets, azurite, malachite, chalcodony, opals and sapphires, combine to make this one of the richest and most attractive mineral districts in the known world.

The Vast Amounts of Gold and Silver

Already taken from these mines, and the steadily increasing flow with which they are now, and for an indefinite future promise to continue, rewarding the application of science and labor, turning large numbers of miners into millionaires, give the strongest possible evidence of the verity of all that has been said, or can reasonably be said, of the extreme richness of this region in the precious metals. The field is still open to the prospector, with promise of as rich "strikes" as have been realized by any of his predecessors in this or any other field on the face of the earth. And there is no reason to doubt that large numbers of hardy, earnest, enterprising, persevering men, now with pick and shovel on the shoulder, will, ere long, become proprietors of mines as rich, and possessors of wealth as abundant, as any who have preceded them, in like pursuits, during the last quarter of a century. Moreover, railway communication is now open to the very heart of this section, giving it all the facilities of the most favored of the States, for procuring supplies of every kind, even from the most remote manufacturing, as well as from the sources of home supplies in the great Salt River valley, which is its central territory, for the production of all the results of agriculture and horticulture. These developments, rendering home supplies readily available, will hereafter make the toil and privation of the prospector far less than has been necessarily endured by those of earlier years, and are now endured by those of other regions. Yet his guaranty of abundant reward for his labor is quite equal to that afforded by the richest mining regions known to man.

Hydrology and Terrene.

Water, in this central portion of Arizona, is more abundant in its resources, larger in quantity, and more thoroughly distributed than in any other portion of the Territory.

The Verde river rises in the forests, on the eastern slope of the Juniper mountain range, near 35° 20' N. L., and running southeasterly and southerly about 150 miles, empties into the Salt river. It is a clear mountain stream, of no inconsiderable proportions, and is always reliable as an abundant supply.

The Black river, rising in the White mountains, north of the prieto plateau and running in a westerly direction some 120 miles, receiving in its course numerous streams, unites with Tonto creek and forms Salt river. This is increased in volume by collateral streams during its course, in a westward direction, of about 100 miles through the entire length of the Salt river valley, and debouches into the Gila river, the largest stream having its bed entirely within the Territory, at a point nearly equidistant from the eastern and western boundaries of the Territory. The Gila extends entirely across the Territory from east to west, and is by far the most important water-course within its borders. It will be readily perceived from the foregoing that the water supply of this district is not only the best in the Territory, but absolutely abundant for all purposes, if scientifically developed and properly utilized.

With this cursory glance at the hydrology of Central Arizona, we naturally approach the consideration of its

Terrene.

A field phenomenally *sui generis*, affording a study of the deepest interest. Long ago (how long, it were presumption to suggest) this whole region was broken up by subterranean convulsions, so that the surface of the country became like a vast ice-floe, everywhere broken and jagged beyond all description. This surface, after becoming measurably cool and hardened, again yielded to volcanic pressure from below, and there arose, by repeated lava flows, those lofty peaks and ranges which now tower up to elevations ranging from 6000 to 12,500 feet. The elements of geologic formations of almost endless variety, in a state of fusion, were forced to the top of those craters (which were continually increasing in height by their

own overflow), and running down the sides, each with sufficient heat to re-melt the surface of its predecessor, mingled with the other substances and resulted in combinations and formations which, for brilliancy and beauty, are not exceeded on the planet. Many of these are mingled with the precious metals in such forms as to render them exceedingly attractive, and in the hands of the lapidary produce gems that in elegance and value vie with the crown jewels of the Orient.

By abrasion and by the disintegrating forces of the elements, through unknown periods of duration, the various constituents of these multiplied volcanic formations have been decomposed, and by the law of gravitation sought and filled the intervening crevices, gorges and canyons, elevating their surfaces and enlarging their areas until they became the valleys and plains as we now find them, at such an elevation as to entirely cover a large portion of the original peaks, leaving at the present day comparatively few above the general level of the country. This surface of the valleys, both large and small, is still being continually elevated by the accretion of particles eliminated from the still protuberant portions; and this material, which is thus enlarging and elevating the surface of the plains, is in a continuous process of refinement and assimilation, producing in many places on the surface an almost impalpable powder, which has the rare quality of receiving and absorbing water with the greatest readiness, and at the same time holding it and not allowing it to leach through until it has received from the water the fullest benefit.

The quality of the soil, often many feet in depth, secures to it a richness of vigor in the production of vegetation not surpassed in the temperate zone. It combines the warmth of tropical sand with all the fertility of pure alluvium, thus reaching the acme of fecundity. The underlying strata are of gravel and sand, such as will, at all times, relieve the surface of an undesirable surplus of water before it shall have operated unfavorably upon seeds or plants.

The New Railway Fares.

We mentioned last week the reduction in passenger fares over the lines of the Southern Pacific System. The following is a fuller statement of changes to take place soon:

The rates from San Francisco to Ogden will be \$35 unlimited, \$30 limited and \$25 third-class. From San Francisco to El Paso the rates will be \$40 unlimited, \$35 limited and \$25 third-class. From San Francisco to Tucson the first-class unlimited will be \$38.15. In all local points in Arizona the reduction will be generally from 8½ to 5 cents a mile.

Following is a list of the principal reductions determined upon:

Between San Francisco and—	Now.	From 1887.

The limited rate under the new schedule from San Francisco to Suisun will be \$1.50; from San Francisco to Davis, \$2.50; from Sacramento to San Francisco, \$2.50; Sacramento to Suisun, \$1.25; Sacramento to Davis, 90 cents.

CAUSE OF EYE DISEASE.—In an article by Dr. Dawson in the last RURAL, it is said that one of the sources of disease may be "ammoniacal gas from wine." It should have been gas from urine, not properly disposed of, thus giving rise to bad air in the stable, etc.

THE PROSPECTOR thinks that the red gravelly hills south of Tombstone, Ariz., furnish just the character of soil necessary for the successful cultivation of the grape. Water for irrigation could easily be procured anywhere below the Huachuca reservoir.

PERSONAL.—We had a pleasant call on Wednesday from Harry Brook, editor of the *Pacific Fruit-Grower*, who has been in the city on business.

From Tuolumne.

EDITORS PRESS:—As Tuolumne has not been represented for some time, we send you a few items. We are glad to note a steady advance in the general make-up of the farmer's friend, and hope you will be enabled to attain a higher degree of perfection in agricultural and horticultural science. It is hard to tell which has the most prominence. Of course, bread will stand at the top-round of man's natural wants, but horticulture has reached an eminence little dreamed of by pioneers and slow coaches.

It is a sight at this season to go into some of our fine gardens and look at the peach trees, loaded down with tempting fruit. Pear, plum, apple, and other species show the effects of high and intelligent cultivation, obtaining new varieties of marked excellence and large dimensions, year by year gaining in number, flavor and favor.

In this county we have all the conditions but one for making us more prosperous at home and looked after from abroad. The want of railroad facilities isolates us. Fruit falls from the trees and lies there to rot, which would grace any market, were means at hand to send it. Time will certainly bring us the rail, but it will be when, not a pioneer is left to greet its advent. Day by day the grizzled old fellows are being laid away to a well-earned rest, their names only known in history.

The fruit crop of the county is a good average, and far above what it has been for a few years past. The watermelon—which many question as to its being a desirable and healthy product—is brought in by the ton from Lodi and Merced river, and finds a ready sale. If some do feel bad effects from eating them, they are devoured, nevertheless, and pay well for cultivation. Lodi seems to be a natural paradise for water and muskmelons, which there attain rich flavor and huge dimensions.

The excessive heat has operated against the gardener to some extent, drying up springs so as to interfere with irrigation and making water scarce in some localities; but despite all the drawbacks, crops are good.

The thermometer registers 88° to-day—the coolest day for some time. The leaves are losing their bright green. Figs are just beginning to fall. The yield will not be quite so full as in former years, the great heat affecting the growth of the young shoots which produce the second crop; but growers in this county realized rather more than an average first crop.

Hay is not very plentiful and brings good prices—\$15 per ton about Chinese Camp, with an advance in Sonora, etc. The quality of the hay is superior; farmers understand how to save it from bleaching.

The mining interests of the county are in a prosperous condition—not by a boom, but in steady and sure results. Many claims are employing a large force of men, and reap a rich reward. The booms bursting all over the lower portions of the State have not been heard in these canyons and may not be for some time; but if many of these excited land-seekers were to stray among our foothills, enjoy our clear skies and pleasant, wholesome atmosphere, they would find that San Jose and Los Angeles are not the only favored spots in this broad and diversified land.

JOHN TAYLOR.
Chinese Camp, Aug. 26, 1887.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING AUGUST 23, 1887.
368,708.—CHURN—M. V. Ensley, McMinnville, Oregon.
368,884.—DREDGE—H. O. Geiger, Tacoma, W. T.
368,587.—INKSTAND—P. D. Horton, Oakland, Cal.
368,588.—TOY CATAPULT—P. D. Horton, Oakland, Cal.
368,589.—PEN-WIPER—P. D. & G. Horton, Oakland, Cal.
368,601.—BRIDLE—E. McEvers, Susanville, Cal.
368,683.—ORE CONCENTRATOR—J. H. Pemberton, Los Angeles, Cal.
368,785.—NUT LOCK—G. W. Roberts, Walla W. T.
368,627.—SYRINGE—T. Threlfall, S. F., Cal.
368,793.—SEWER GAS TRAP—John Tilton, S. F., Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

COGSWELL POLYTECHNIC COLLEGE.—The corner-stone of the Cogswell Polytechnic college was laid in San Francisco, August 27th, at the corner of Twenty-sixth and Folsom streets. Several hundred spectators were present. Rev. Dr. Barrows opened the exercises with prayer. Mayor Pond presided and made a short address, and Col. Stuart M. Taylor delivered an oration, which drew warm and frequent plaudits.

PERSONAL.—E. J. Breen, one of the Donner party, now a resident of San Juan, recently visited the spot where the fated party camped. He is now a large and successful farmer and stock-raiser. His ranch of 24,000 acres, near "Topo," is stocked with fine beef cattle.

PACIFIC COAST WEATHER FOR THE WEEK.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature. Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours. T indicates trace of rainfall.

Santa Rosa Nurseries.

A RURAL representative made a visit to Luther Burbank's home nursery at Santa Rosa on the 27th inst. His olive plot is quite extensive, and he will be able to put on the market 125,000 of the Picholine variety. He has recently added six acres adjoining, to be set out and enlarge his nursery. His Sebastopol nursery, we were informed, was in a very thriving condition, and no scale had made its appearance in any of his nurseries. Our representative was shown several varieties of imported trees, among which was a quince from France that was a very prolific bearer. He was informed by Mr. Burbank that he recently imported some new varieties from New Zealand.

As an enterprising and very successful nurseryman, Mr. Burbank has kept abreast and in advance of the times in securing and importing new varieties and standard fruit. Preparations that are being made to plant a large acreage in orchards and vineyards in different parts of the Pacific Coast will no doubt tax largely the immense stock that he has in several nurseries.

Only Thirty-six Per Cent

Of those who die from consumption inherit the disease. In all other cases it must either be contracted through carelessness, or, according to the new theory of tubercular parasites, received directly from others as an infectious disease. But in either case, Dr. Pierce's "Golden Medical Discovery" is a positive remedy for the disease in its early stages. It is delay that is dangerous. If you are troubled with shortness of breath, spitting of blood, night-sweats or a lingering cough, do not hesitate to procure this sovereign remedy at once.

The Splendor of Dress

And the artificial effects of cosmetics, no matter how deftly applied, can never make beautiful or attractive one who is subject to emaciation, nervous debility, or any form of female weakness. These must be reached by inward application, and not by outward attempts at concealment, and the ladies may take hope from the fact that thousands of their sisters have made themselves more radiant and beautiful by the use of Dr. Pierce's "Favorite Prescription" than they could ever hope to do by the aid of the appliances of the toilet.

The cleansing, antiseptic and healing qualities of Dr. Sage's Catarrh Remedy are unequalled.

CORN FESTIVAL.—In Sioux City, Iowa, says the *Quincy Whig*, arrangements have been completed for the erection of a corn palace, and a grand jubilee, in celebration of the immense crop of corn, will be held Oct. 5th to 8th. The corn palace will be a structure reared of corn. The principal streets will be arched and decorated with corn, ladies will wear corn as a decoration, and veritably corn will be king. The exhibition will not be confined to Iowa alone, but the great cornfields of Nebraska, Minnesota and Dakota will send their quota.

BERKSHIRE SALES.—The latest transcript from the *American Berkshire Record*, sent us by Phil. M. Springer of Springfield, Ill., has the following: Knight of Marin, 17,427, Frank H. Burke, Menlo Park, Cal.; to John N. Tyler, Point Reyes, Cal.; Uipoma, 17,435, Frank H. Burke to C. W. Merritt, Santa Maria, Cal.

"De man wot knows it all is alluz a-makin' change, a-buyin' ob experience." The man who does not think that he "knows it all" about Pumps can find out a great deal about them in *Grimshaw's PUMP CATECHISM*. By mail, postpaid, \$1. Dewey & Co., 220 Market St., S. F., Cal.

Important to Tree Planters.

One hundred and twenty-five thousand Fruit Trees for sale at a bargain, consisting of Apple, Pear, Peach, Apricot, soft and hard-shell Walnuts; also 2000 Fan-Leaf Palms. Sales will be made in lots, or the Nursery and stock will be sold on the most liberal terms as to price and payments, or will be exchanged for real estate. Inquire of J. M. Hixson, Real Estate Agent, 75 N. Spring street, Los Angeles, or address the proprietor, Milton Thomas, P. O. Box 304, Los Angeles, Cal.

COMMISSION FIRM.—A new card in our advertising columns bears the name of Cofer, Hills & Co. as commission merchants for the sale of dairy and general farm products and wholesale dealers in provisions. The firm is highly recommended to us by those who have opportunity to know the business standing of the members.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
G. W. INGALLS—Arizona.
Geo. McDOWELL—Santa Clara Co.
W. J. FARREWAY—Nevada.
J. L. DOYLE—Nevada Co.
WILLIAM POOL—Fresno Co.
R. G. HUSTON—Butte, Montana.
E. P. SMITH—Humboldt Co.
EDMUND WRIGHT—Shasta Co.
M. S. PRIME—Solano Co.
SILAS PRUDEN—Colusa Co.
B. R. McPHERSON—Santa Barbara Co.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

A WELL EARNED REST.—Mr. Hiram Corey of Salinas valley, Monterey county, has sold the Buena Vista rancho, consisting of 7000 acres of very rich and productive land, to a syndicate who will cut up the ranch in lots and parcels of from 80 to 200 acres suitable for farming and fruit-raising. His large, select and valuable herd of cattle will be sold at auction late in the fall if not disposed of before. This will be a rare chance for persons who wish to make a home, and add materially to the prosperity of this section of our State. Mr. Corey has made an ample fortune by a system of mixed farming, and intends to spend a year or more in travel for rest and recuperation after 20 years of close attention to a large business.

SCALDS and BURNS
Should have proper care or they may prove very dangerous and perhaps FATAL.

ACCIDENTS
are constantly happening. A kick of a horse or cow may cause a bad bruise; the slip of an axe or knife may result in a serious cut.

Any of these things may happen to one of YOUR family at any moment.

Have you a bottle of **PERRY DAVIS' PAIN KILLER** ready for use in such cases? It has no equal for the cure of Scalds, burns, cuts, swellings, bruises, sprains, sores, insect bites &c.—All Druggists sell it.

PERRY DAVIS & SON, PROVIDENCE, R. I.

SEDGWICK BROS., Richmond, Ind.

EVERY FARMER

THE BEST
is the
CHEAPEST

WE HAVE HAD 32 years Experience.

Use the Halladay Standard Geared Wind Mill, I-X-L Corn Sheller and I-X-L Iron Feed Mill and do your shelling and grinding at home, thus saving toll and teaming to and from the first mill. This work can be done rainy, windy days, when out-door work is suspended on the farm. The same mill will cut corn stalks, saw wood, run churn and grind-stone, pump water, etc.

We manufacture the Halladay Standard Geared and Pumping Wind Mills, I-X-L Corn Shellers, I-X-L Iron Feed Mills, I-X-L Stalk Cutters, Horse Powers, Jacks, Saw Tables, Standard Hayrack Tools, consisting of Anti-Friction, Reversible, Swivel and Rod Hay Carriers, Harpoon and Grapple Horse Hay Forks, Pullers and Floor Hooks. Also a full line of Tanks, Tank Fixtures and Pumps for Farm, Ornamental, Village and Railway purposes. Send for catalogue and prices.

Reliable Agents wanted in all unassigned territory.

S. H. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, August 31, 1887.

Continued fair weather has allowed farmers to make free deliveries of all kind of products. The past week witnessed a better market for fruits, but a dull, weak market for wheat. At the East wheat fluctuated but did not recede, but in Europe prices went off. To-day's English cables are as follows:

LIVERPOOL, Aug. 31.—Wheat—Good demand for white, while red is depressed. California spot lots, 55 9d to 6s; off coast, 31s 6d; cargoes off coast, very slow; on passage, very inactive; Mark Lane wheat, quiet; French country markets, quiet but steady; wheat on passage to Continent, 351,000 qrs; wheat and flour on passage to U. K., 1,918,000 qrs; wheat and flour in Paris, rather easier.

Foreign Review.

LONDON, Aug. 29.—The *Mark Lane Express* in its weekly review of the British grain trade, says: The harvest progresses well, and the variability in the yield and quality of the crop becomes more pronounced. Trade values continue to droop. In the London market prices have fallen 6d to 1s, and in the provincial markets 1s. The sales of English wheat during the past week were 35,832 qrs. at 30s 10d per qr. against 36,363 qrs. at 33s 2d during the corresponding week last year. Country flour has fallen to 6d. Foreign wheat at Liverpool has declined 1d per cwt; flour is 6d cheaper. Linseed is down 3d. There were 24 arrivals of cargoes off the coast during the week. One cargo was sold, one was withdrawn and 9 remain. To-day trade in wheat was very slack. The values of new English were 6d to 1s lower; Duluth and Indian were unchanged; other kinds 6d to 10d lower. Flour was dull; country and foreign 6d lower. Linseed was 6d to 9d lower.

Eastern Wheat Markets

NEW YORK, Aug. 28.—Wheat options closed firm. Aug. 79½; Sept. 80; Oct. 81½; Nov. 82½; Feb. 86½; Mar. 87½; Apr. 88½; May 89½; June 90.

Crops at the East.

WASHINGTON, Aug. 28.—The weekly weather and crop bulletin issued by the Signal Office says: Reports indicate that the rain during the past week proved favorable for the growing crops in the corn region, although the yield in the principal corn-producing States will be materially reduced by the drought. The weather has been especially favorable for pastures and late planted potatoes.

Eastern Wool Markets.

BOSTON, Aug. 26.—Prices have declined further in nearly all grades—most noticeably on Ohio and Pennsylvania fleeces. Conservative hand-to-mouth purchasers are in the majority. Total sales of the week were 1,735,000 lbs. Territory wools are in large supply and offered at low prices. Sales include 50,000 lbs medium, and fine medium at 22½¢, 5000 lbs medium at 22¢, and 5000 lbs fine at 18 to 19¢. Eastern Oregon is in moderate demand, and sales are reported of 36,600 lbs at a wide range of prices. In California spring wool there have been small sales at 19¢. The sales include 21,000 lbs on private terms. Fall wool is dull and neglected at any price. Sales of scoured have been reported of 12,000 lbs at 50¢, 15,000 lbs scoured at 40 to 60¢, 2000 lbs California at 56¢, 40,000 lbs at 35 to 40¢, and 56,000 lbs on private terms.

NEW YORK, Aug. 27.—The general condition of the market remains unchanged. There has been nothing to stimulate purchases at interior points, and the demand shows no great improvement. Among sales were 5000 lbs Eastern Oregon at 23¢; 25,000 lbs Territory at 21 to 25¢.

The Philadelphia market is quiet, with the general demand light and unsatisfactory. Among sales were 30,000 lbs California defective at 19¢; 20,000 lbs fine Territory at 15 to 20¢; 1000 lbs Territory bucks at 10 to 12¢; 5000 lbs Territory one-fourth at 24¢; 27,000 lbs Territory fine medium at 19 to 22¢.

California Fruit at Chicago.

CHICAGO, Aug. 27.—The supply of grapes was heavy, and being Saturday, it was necessary to close out, for by Monday most of the stock would be worthless. California varieties showed a better demand than at any time this week. Muscats brought \$2.50 to \$2.75. Tokays \$2.75 to \$3. Pears continue in liberal supply with demand inadequate, and prices weak. Bartletts \$2.75 to \$3. Beurre Hardy \$1.75 to \$2. Clairgeau \$2 to \$2.50. A dull market was noted for peaches, for under existing circumstances dealers could not afford to let an opportunity to sell go by. Late Crawford and Orange Clings brought \$1.25 per box. Prunes sold well at \$1.30 to \$1.40 per box for German and Gros. Quinces \$2 to \$2.50.

CHICAGO, Aug. 29.—The California dried fruit market is firm and a good demand exists. Spot goods are scarce, consignments of all kinds of fruits being placed upon arrival, and sales are being made of fruits to arrive. Apricots, sun-dried, bleached, choice, 15 to 15½¢; do. sun-dried, bleached, prime, 14 to 14½¢; do. sun-dried, not bleached, 9½ to 11¢. Peaches, peeled, evaporated, good, 21 to 21½¢; do. unpeeled, evaporated, fancy, 14 to 16¢; do. unpeeled, evaporated, choice, 16 to 17¢; do. good 13 to 14¢; do. unpeeled, sun-dried, 9 to 10¢. Plums, pitted, new, 13 to 14¢. Raisins, loose Muscatel, old, per box, \$1.45; do. London layers, per box, \$1.55 to \$1.60.

CHICAGO, Aug. 30.—California fruits continue in good request. Choice fruits rule about steady. Pears are perhaps a little easier, owing to the large supply of Bartletts from near by. Grapes ruled weaker, because of large receipts of home-grown fruit of that variety. California varieties receive a better demand everywhere than home-grown fruits. The following prices were received for fruit in fine condition, all else being lower: Tokay grapes, \$2.50 to \$2.60 for double crates, and \$2.25 for Mus-

cats. Orange Cling and late Crawford peaches, \$1 to \$1.25. Bartlett pears, \$2.50 to \$2.75; Beurre Hardy do., \$1.75 to \$2; Clairgeau, \$1.25 to \$1.50; quinces, \$2 to \$2.25 per box.

California Fruit in New York.

NEW YORK, Aug. 25.—California fruits sold as follows to-day at auction: Pears, Bartlett and Del. 62½¢ to \$2.12 per bx, according to condition. 207 hi-bxs El Dorado Mountain peaches, \$1.10; 48 hi-bxs Orange Cling peaches, \$1.15; 28 do, \$1.10; 47 do, 70¢; 40 hi-bxs Freestone peaches, \$1.37½; 188 do, 45¢; 19 hi-bxs Muscat grapes, \$1.37½; 144 do, 75¢; 65 hi-bxs Tokay grapes, \$1.50; 30 crts do, \$3.50; 55 hi-bxs Golden Drop plums, \$2.05. Peaches come into competition with arrivals from near-by points, 30 carloads having been received this morning, and many Californians are in bad order. Pears are arriving dead ripe and no more should be sent. Tokay grapes are in good demand and give promise for later arrivals. Plums are also in good demand.

NEW YORK, Aug. 30.—Two carloads of California fruit were auctioned to-day as follows: Bartlett pears, \$1.37½ to \$2.12 per bx; peaches, \$1.20 to \$2.25 per hi-bx; Muscat grapes, 70¢ per crt; Tokay grapes, \$2.80 per crt, \$1.60 per hi-bx. The pears were rather small, but quite sound. There are too many in the market from up the Hudson river. Peaches are good. The Muscat grapes had decayed slightly.

Canned and Dried Fruit in New York.

NEW YORK, Aug. 27.—Canned—California pears, \$3.25. There have been large sales of pears during the past week, the prices of which will be agreed upon later. Dried Fruits—California and Malaga raisins are without special change; 2-crown \$1.25; 3-crown, \$1.40 to \$1.45.

Eastern Hop Markets.

NEW YORK, Aug. 27.—The market is quiet, with prices nominal and the tone of the market short of being firm. Coast crop, 1886, best, 16 to 17¢; same, common to good, 13 to 15¢; 1885, good to prime, 10¢.

Honey Crop.

NEW YORK, Aug. 30.—A dealer of long experience says: Honey will be high this year. Three leading honey-producing States—Illinois, Wisconsin and Michigan—have no honey at all, and in many parts of these States the bees are being fed on sugar to keep them from starving. Last year California sent honey to this market by the carload; this year they have scarcely enough for home consumption. New York is the only State having a good yield, but it does not produce enough to keep the price down.

Beans.

The Chicago *Grocer* says: It has recently been developed that the coming crop of beans in this country will be largely deficient, owing to the drought which has affected the principal bean-growing sections. This information has caused a much stronger feeling in the article and an advance of from 15 to 20 per cent. It is a little soon to give any definite information as to what the shortage will amount to. It is variously estimated at from 25 to 40 per cent short of an average crop. Cable advices from Europe also speak of the failure of the crop in Hungary, the principal bean-growing district of that country. The market on the other side, owing to the large call from the United States, is very much excited, and prices there have advanced in keeping with those of this country. It is safe to say that beans will rule much higher for the coming season than for a number of seasons past.

In the local market prices are strongly adhered to for all choice grades; some dealers are even asking an advance. At the close to-day there is quite a movement in whites, with higher prices ruling.

Local Markets.

BAGS—The pool is reported to be still taking up all the odd parcels put on the market. In lots, quotations for Calcuttas are as follows: 7½ to 7¾ on spot.

BARLEY—The unsettled condition of wheat in consequence of the entire collapse of the wheat pool, affects, unfavorably, barley. Receipts continue upon a liberal scale, with sellers more or less urgent. It is claimed that a higher range will obtain soon, owing to farmers having stored. On Call options were more or less steady throughout the week. To-day's sales were as follows:

Morning Session: Buyer 1887—100 tons, \$1.03½ per cwt.

BUTTER—Choice grades are strongly held at full prices. The demand is both locally and for shipping. The local trade is running chiefly on pickled.

CHEESE—The market is steady, with a strong undertone. The demand is both shipping and local.

EGGS—Strictly choice fresh laid are in request at full figures. Other qualities show more firmness.

FLOUR—In sympathy with wheat the market is lower. At the lower prices there is a good export demand.

WHEAT—The market has been more or less unsettled the past week, owing to the utter collapse of the pool. Their final failure will throw large quantities of wheat on the market, and, as usual in such cases, buyers are sending prices to too low figures. Sales of sample parcels were made the past week at our quotations. To-day's Call Board sales were as follows:

Morning Session: Buyer season—100 tons, \$1.42; 400, \$1.42½. Seller 1887—200 tons, \$1.22½; 100, \$1.22½ per cwt.

[COMMUNICATED.]

Market Information.

Cereals.

The *Mark Lane Express* makes the wheat crop of the United Kingdom 70,800,000 bu—about 8,000,000 bu in excess of last year.

Only one-fourth of the barley crop of Germany will be of really fine quality.

A St. Petersburg dispatch says: Official returns of the condition of the Russian winter wheat crop from 35 districts and of summer wheat from 4 districts are very favorable, and from the remaining 23 winter wheat and 18 summer wheat districts the reports make a fair showing.

From *Beerbohm's*, Aug. 12, the following is obtained: The weather in England has continued of

an exceptionally favorable character for the harvest, although the temperature has been cooler since Wednesday. Heavy rains are reported from the extreme north of Europe, but so far the United Kingdom has been practically free, and the new wheat is being rapidly secured in fine condition; what promised, therefore, to be a late harvest, has proved, under the influence of phenomenally fine weather, to be actually 10 to 15 days earlier than last year. The same is the case in France, where the harvest is in a very forward state, and where new wheat is now freely offered in the country markets. In Germany wheat-cutting is also in progress, and a good crop is expected, but concerning the yield of rye there are numerous complaints. In Hungary the wheat crop is proving to be a very good one—better than for some years past; and in Roumania the prospects are equally favorable. The Russian wheat crop is also reported to be exceptionally good in some districts, and very satisfactory in almost all other parts of the country. From Spain and Italy the reports are rather unfavorable.

The London *Times*, just to hand, contains the following: In what is pre-eminently a wheat season we are not reaping a great harvest. Discounting the deficiency of the wheat yields on certain soils, considering the many failures of barley, not fully compensated for by the quality of what may be harvested in case the in-gathering should meet with a favorable time, and taking into account the generally poor return of the oat crop, we are prepared to find, upon detailed examination, that the total cereal produce of 1887 turns out only moderate in quantity. Once again will be realized the general law of wheat production in Britain—namely, that the yield per acre is proportional to the summer temperature, with the modifying conditions of rainfall, prevalence of cloud, character of the weather at blossoming time and during harvest, and the state of growth of the plant at the commencement of the summer. The paramount influence of a high or low thermometer during the two principal months of filling or ripening the wheat ear is again established, but we do not look for an abundance comparable to the harvest of 1863, or to that of the hot season of 1868, when the mean temperature of July and August was 4 degrees above the average; or surpassing the yield of 1870, when a very fine sunny season, with very favorable blooming period, followed by a hot harvest, exercised the greatest effect rather than a high mean temperature.

The final collapse of the wheat pool was announced on last Saturday, taking all by surprise, for on the preceding day considerable money was paid out by Messrs. Dresbach and Rosenfeld to margin down wheat. They claim that further declines in the Liverpool wheat market and the closeness of the money market in this city were against them, and being unable to obtain further loans on wheat they had to suspend. Their suspension sent down the price of wheat both in the open market and for options. At the lower prices very little trading is done, as the market is virtually in the hands of English export buyers, and they were never known to pay good prices. Farmers have to thank bear dealers in this city for this condition of affairs. They fought the bulls, broke them, and now there is a low depressed market.

There was not a vessel chartered the past week to load wheat at this port for Europe.

Under heavy receipts, barley has ruled weak and in buyers' favor throughout the week. The consumption continues large, while the shipping demand is increasing. It is claimed that the market will begin to improve soon, owing to farmers having stored their grain not being disposed to sell.

Oats are weak and in buyers' favor, under free receipts and liberal supplies, with dealers and consumers only buying in a small way.

Rye holds to firm prices, under a good demand and light obtainable supplies.

Buckwheat is without essential change—dull and heavy.

Feedstuff.

Hay continues steady, with a firm tone, under moderate receipts and a good demand. There is a growing impression that the supply will not equal this winter's demand, particularly if the winter is severe, which it is likely to prove, owing to the open character of the two preceding winters.

Brans and middlings are low, but more active at the decline. Now that the mills are running on longer time, prices are expected to go still lower. Ground barley is weak and in buyers' favor. The demand is good.

Fruits.

Apples continue in liberal supply, with the more choice varieties showing better. The demand is improving.

Apricots are going out, consequently prices are more or less nominal.

Choice peaches are wanted, and fetch an advance on last week's prices. Canners are still in the market.

Choice pears are growing scarcer. They fetch full prices, with both the trade and canners buying.

All kinds of berries are higher, with raspberries going out.

Choice table grapes are in better request, with a slight advance in prices obtainable. Wine grapes are offering more freely, causing some shading in prices.

Eastern advices report the market for raisins well cleaned up, but as yet dealers are not willing to name prices for this year's Californian. Choice, well-selected and well-packed raisins will be in good request this winter.

Dried fruits are in increasing demand for shipping overland, with the market very firm at full prices. Several kinds are higher, and at the advance find ready buyers.

Vegetables.

Potatoes continue to come forward freely, but the demand is also good. Prices do not show any signs of advancing yet, but many claim that values are liable to go higher soon, but on what the opinion is founded, the writer is not able to learn.

Onions, if choice and well selected, have a firmer tone, but no advancing tendency, although it is not at all unlikely that a higher range will obtain before long.

Tomatoes are in good request for canning, but as the supply exceeds the demand, the market favors buyers.

Seasonable vegetables are without essential change, but prices for those going out are stronger for the better qualities.

It is claimed that owing to the drought last

month at the West, heavier and earlier shipments of cabbages will be made overland this winter.

Live-Stock.

Beef cattle are barely steady, owing to continued free offerings. The demand is only fair. Mutton sheep are offering more freely, but prices are well maintained. Hogs are weaker. It is claimed that a lower range will rule when farmers take them off the stubble. In horses there is nothing new to report.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7 to 7½¢; first grade, grass fed, 6½ to 6¾¢ per lb.; second grade, 5½ to 6¢; third grade, 4½ to 5¢.

MUTTON—Ewes, 5½ to 6¢; wethers, 6 to 6½¢.

LAMB—Spring, 7 to 8¢.

VENISON—Large, 6 to 7¢; small, 6 to 8¢.

PORK—Live hogs, 4½ to 4¾¢ for heavy and medium; hard dressed, 7 to 7½¢ per lb.; light, 4½ to 4¾¢; dressed, 7 to 7½¢; soft hogs, live, 3½ to 4¢. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	301,879	304,537
In port, disengaged.....	54,692	59,554
In port, engaged.....	24,883	70,871

Totals..... 381,444 435,962

The above gives a carrying capacity as follows: 1887, 621,459 short tons; 1886, 704,963 short tons; showing a decrease compared with last year of 83,504 tons.

Fall wools are coming in very freely, with the grades showing to better demand. Sales of burry and defective are reported made as follows: Southern 90 to 12½¢; middle, 100 to 13½¢; clean and medium to fine from 2½¢ to 50¢ per lb. higher.

In hops there is nothing new to report. The inquiry is freer, but no supplies are coming forward yet.

Poultry has ruled fairly steady throughout the week.

In seeds there is nothing new to report. Dealers expect another advance in grass seeds.

San Francisco, August 31, 1887.

Fruits and Vegetables.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations. WEDNESDAY, Aug. 31, 1887.

WEST COAST LAND CO.

TEMPLETON, SAN LUIS OBISPO CO., CAL.

Home of Wheat, Fruit, Wine and Olive; 15,000 acres sold in past 8 months to 220 settlers, representing a population of 1100; 49,000 acres—small subdivisions—average, \$22.50 an acre; 1/2 cash, balance 5 years, 6 per cent. Catalogues and maps free. C. H. PHILLIPS, Manager.

A NEW COLONY

On the new extension of Southern Pacific Railroad, on the lands belonging to R. T. BUELL, Esq., near Los Alamos, Santa Barbara county, Cal. Parties desiring to visit the property now, can go via San Luis Obispo and take the cars from thence to Los Alamos, thence by stage to the Colony. 20,000 acres of the best lands in California, subdivided into 20, 40 and 80-acre farms; \$20 to \$30 per acre. INTERNATIONAL IMMIGRANT UNION, 401 California St., San Francisco

BOOM! BOOM!

We do not care to boom the price, but to move large quantities of goods we have to make low figures. Are offering good White Flour at \$4.50, Roller at \$4.75, and highest grades of Extra Family at \$4.90 to \$5 per barrel.

Feed and Grain

Of all kinds lower, except Corn. We take pains to fill orders with the very best. These cool mornings your poultry need a little Japanese Egg Food, at \$1.50 per 100 pounds, or Bone Meal, at same price. And as a tonic give a spoonful of Red Pepper occasionally. We sell it 5 pounds for \$1. We are ready to fill orders for Winter Supplies promptly. New List is out and will be mailed free by

SMITH'S CASH STORE.

115 and 117 CLAY STREET, SAN FRANCISCO, CAL.

ZIMMERMAN
Fruit Evaporator.

Read Some of the Testimonials.

I have found the Machine (No. 3) very simple, and it does the work to perfection. Parties who have larger Driers of different makes say they cannot turn out superior fruit (apricots and peaches) to mine. Vacaville, June 12, 1887. I. W. A. GILMORE.

I found the Machine (No. 2) good, and can truly subscribe to all the merits claimed for it. I have sent apples to Santa Rosa and they sold as first-class. Laguna, July 15, 1887. W. H. J. AITKEN.

Evaporator came safe to hand (No. 3). Have tried apricots with good success. E. C. CLEWES. Stockton Nursery, July 15, 1887.

Before writing I wanted to test the Drier also on peaches, apples and pears. Am now doing so with the very best results. Upon the whole, I am greatly pleased with the Drier. (REV. DR.) W. ALEXANDER. Batavia, July 29, 1887.

I am doing fine work with the Drier (No. 3). I bought it in company with Mr. A. J. Lay, and he, after trying it, takes it all. You can refer to me and I will try to sell more. C. C. MARTIN. Glenwood, August 5, 1887.

I have been using a Zimmerman (No. 3) Evaporator on my apricots this season, and cheerfully attest the fact that its performance is fully up to its promise. Its simplicity is such that, although novices, we have succeeded in turning out admirable work, and its economy and facility are quite remarkable. JAS. PALACHE, August 9, 1887. (Of Kittle & Co., S. F.) Send for descriptive pamphlet to

JAMES LINFORTH, 120 Front St., S. F.

DERICK'S HAY PRESSES.

are sent any where on trial to operate against all other presses, the customer keeping the one that suits best.

Order a trial, address for circular and location of Western and Southern Storehouses and Agents. P. K. DERICK & CO., Albany, N. Y.

CAUTION!

AUNT ABBEY'S

On account of the gross imposition practiced by many grocers who sell an inferior article in bulk which they empty into our barrels and represent to be AUNT ABBEY'S EASTERN COOKED ROLLED OATS, we recommend that, in order to secure the GENUINE, families purchase this article in 10-pound sacks or 2-pound packages.

MITCHELL & PETERSON, Agents, 34 California St., San Francisco.

BACK FILES of the PACIFIC RURAL PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

THE BOOM!

There can be little doubt but that the great activity now prevailing in land is because the "CYCLONE" Windmill is able to irrigate all the land in California.

ORANGE, LEMON & LIME TREES
FOR THE SEASON OF 1888.

Having the exclusive Agency of the Pacific Coast for the extensive Nurseries of A. Wimberly and A. J. Bach & Son, of Palatka, Florida, we are prepared to furnish Orange, Lemon and Lime Trees of all the leading varieties (budded on seedling stocks) in any quantity desired, from one tree to ten thousand,

AT PRICES THAT ALL CAN AFFORD TO PLANT.

These Trees are all first-class, 3 feet and upward in height and three-fourths of an inch and over in diameter at base of bud.

It will be necessary to give your order early to secure prompt delivery. Special prices given for carload lots. Write for prices or any information desired. Address

C. W. REED & CO.,

SACRAMENTO, CAL.

ORANGE TREES! ORANGE TREES!

Also LEMON and LIME, in large or small lots, both wholesale and retail, CHEAPER THAN EVER BEFORE OFFERED IN THIS MARKET, of the best known varieties.

Our Washington Naveles were budded to order, with buds from original trees at Riverside. All other varieties selected by personal inspection; possess the highest excellence and great bearing qualities. They are all budded on the famous sour stock, which is hardier, more vigorous, longer lived and superior in every respect to the sweet stock.

We are prepared to take contracts to plant groves of these trees, and guarantee them to grow. We can also furnish Seedlings in any desired quantity, either Sweet or Sour, at VERY LOW RATES.

Place your orders soon, to secure choice trees at the lowest rates. Send for descriptive circular and price list. Address

W. R. STRONG & CO., Sacramento, Cal.

SAN FRANCISCO, CAL.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOBBE—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,

DR. E. A. SCHNEIDER.

University of California, College of Agriculture.
 BERKELEY, Nov. 20, 1886.

DR. J. KOBBE, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the **MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD**, President, room 7, Safe Deposit Building, or

H. M. NEWHALL & CO., Agents, 309 and 311 Sansome St., San Francisco.

THE GOLDEN GATE PLUG CLOSET.

WITH TRAP.

This Closet is the Best, Because

1. It has a simple, strong valve, suitable for any pressure, self-closing by a genuine Phosphor Bronze Spring, acting with the pressure. To prevent breaking and weakening of the spring, I have gone to the expense of using Phosphor Bronze Wire, which will have the desired effect.

2. It has a real sanitary overflow, a copper float attached to a ball of the same metal resting on face of the brass overflow pipe, operated by the rising of the water in the closets above its level, thus absolutely preventing any escape of sewer gas, even the closets being without water.

3. It has no dead corner, consequently no foul water will be left in the closet after lifting of the handle. A constant rush out of the flood chambers will keep the closet and trap perfectly clean.

With above stated points, I am able to call my Closets the most perfect and cheapest in the market.

N. B.—Architects who endeavor to furnish their patrons with the most reliable goods, should not hesitate to give this closet a trial. Send for descriptive catalogue.

MERY'S IMPROVED PIONEER

BARLEY CRUSHER

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT.

VALUABLE IMPROVEMENTS HAVE BEEN
ADDED THIS YEAR.

This Mill has been in use on this Coast for 6 years,
TAKEN THE PREMIUM AT THE STATE FAIR
Four years in succession, and has met with general favor,
there now being

Over 200 of them in use in California, Nevada & Oregon
It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

GRAINLAND,
BUTTE CO., CAL., June 9, 1887.
Mr. M. L. Mery—DEAR SIR: We have used one No. 2 Roller Barley Crusher now for eight years and have used it steady during that time; have crushed 45 tons a day, and the crusher is as good to-day as when it came out of your shop. I am satisfied that it is the best mill made. You may reconstruct this testimonial to the best advantage for you and sign our names, for you cannot overrate the merits of your mill.
F. E. REAM,
JOHN P. SUTTON.

DURHAM, May 21, 1887.
Mr. M. L. Mery—DEAR SIR: In reply to yours of the 19th, would say that I crushed from two to two and a half tons per hour, but could crush three and a half tons per hour if my elevators were large enough to carry the barley from the machine. The No. 1 machine I used at Gridley was run on a sack a minute, but if we got behind we could run through five tons an hour, and do good work. The machine I use here is a No. 2.
Yours,
WM. M. TAYLOR.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

HOP PRESSES.

Send to us for circular, cuts, and prices of new hand-power Hop Press possessing the following advantages:

1. Perfect facilities for putting on the cloth, as the bale, after being pressed, is fully exposed at the sides and ends.
2. A good depth of box for a hand press (7 feet).
3. A perfectly tight and solid box with no slots or sliding pieces at the ends.
4. A press that presses downward so that bales come out at the bottom.
5. Powerful progressive leverage and the entire absence of cast iron racks (which are always liable to break and fail to give the required power at the pinch).
6. A balanced follower that goes up without assistance.
7. A press which lets the follower swing entirely out of the way when up so as to allow of easy feeding, and which has no overhead beams in the way.
8. Perfect facilities for feeding, the top of the press being even with the floor, so that the hops can be pushed or slid into it.

ANGLE SIEVE GRAIN CLEANER & SEPARATOR,

THE CHAMPION WHEAT CLEANER OF THE WORLD,

Manufactured by the Stockton Combined Harvester & Agricultural Works, Stockton, Cal.

THE ANGLE SIEVE,

For Cleaning Oats, Sticks and Weeds from Wheat, Barley or Flax, or Seeds of any kind, it Excels any Side-Shake Gang Sieve Cleaner on this Coast.

The Angle Sieve is a New Feature on the Pacific Coast,

But the Leading Cleaner East of the Rocky Mountains. The peculiar construction of the ANGLE SIEVE with longitudinal ribs running through it with V < > shaped angle, is so arranged and put together as to prevent Oats from going through and yet let the Wheat and Barley through readily. It has a back and upward movement, at the same time giving grain a throw at every motion, compelling it to travel up grade over the sieve instead of down grade, as all other machines do. Oats, being a longer grain than Wheat or Barley, is unable to make the turn and is thrown out, making a

COMPLETE SEPARATION.

The general construction of most Cleaners depends upon either Blast or Suction to make the separation; experience teaches that neither will make it complete. As all kinds of grain are not of the same size and that whenever sufficient blast or suction is applied to remove the heavier grain, such as Oats from Wheat or Barley, the smaller grains of Wheat or Barley will also follow, and in like manner so it will be with any kind of grain.

SIZES OF SIEVES.

We make and furnish different sizes of sieves to suit the sizes of grain which is desired to be cleaned. We make the Angle Sieve out of tin, which is cut and pressed into a V shape, and slotted at the same time, so as to allow the flat strips to be run in and form the cup to the angle.

No Grain Dealer, Miller, Maltster or Farmer can afford to be without this machine, as it will handle grain as no other machine can with going once through the Cleaner.

Our prices on warehouse machines are very low, being only one-half the price other Wheat or Barley Cleaners sell for.

All power machines are complete with tight and loose pulleys, and possess the eccentric motion.

THE ANGLE SIEVE GRAIN CLEANER

Is extensively used in Illinois, Iowa, Wisconsin, Minnesota and Dakota and is fast supplanting all others, cleaning all kinds of grain successfully and without waste, and supplying the greatest need of a grain-growing country. It has been thoroughly tested in California, and its merit is bringing it to the front as superior to all others.

Different Sizes of Machines.

We manufacture these machines in different sizes to suit the wants of purchasers. They are numbered 1, 2, 3 and 4. Nos. 1 and 2 are for hand power, yet No. 2 can, if so stated in order, be built for power. Nos. 3 and 4 are to be run only by power.

The No. 2 Power Cleaner is made stronger than the No. 2 hand machine, and has 1-inch Fan shaft.

The No. 3 Cleaner is made still stronger, has 1 1/2-inch Fan shaft.

The No. 4 is still heavier and stronger, has 2-inch Fan shaft.

To see the work accomplished by the Angle Sieve Grain Cleaner and Separator will convince the most skeptical that it is the true principle for cleaning grain. There is no other Cleaner manufactured in California or the East that has or can do as good work, and for a Stationary Cleaner it has no equal.

DIMENSIONS OF MACHINES.

No. of Machine.	Capacity. Bushels Per Hour.	Extreme Height.	Space on Floor Over All.	Size of Pulley.		Rev. per Minute.
				Diam.	Face.	
1.....	35 to 60	3 feet 4 inches.	2 feet 6 inches by 4 feet.	6	2 1/2	350
2. Hand.	75 to 150	3 feet 8 inches.	4 feet 1 inch by 4 feet 7 inches.	6	2 1/2	380
2. Power	75 to 150	3 feet 8 inches.	4 feet 1 inch by 4 feet 7 inches.	6	2 1/2	380
3.....	150 to 250	4 feet 11 inches.	5 feet 9 inches by 4 feet 7 inches.	8	2 1/2	380
4.....	250 to 400	4 feet 11 inches.	7 feet 4 inches by 4 feet 11 inches.	8	2 1/2	380

A thorough test of the Angle Sieve Grain Cleaner was made at the Transfer and Grain Warehouse of the California Steam Navigation Co., Stockton, by the Manager, H. W. Weaver, and others, as will be seen by their

TESTIMONIAL.

Stockton, Cal., August 6, 1887.

S. C. H. & A. WORKS—GENTLEMEN: We take pleasure in certifying to the merits of the Angle Sieve Grain Cleaner and Separator, manufactured by you, which we have seen work, examined and given a thorough trial. The work performed is convincing proof that the Angle Sieve, so peculiar in construction, is the best Cleaner and Separator for California grain that we have ever seen or used, and we recommend its use and adoption by our farmers and in grain warehouses.

PACIFIC RURAL PRESS

STATE FAIR EDITION—TWENTY-EIGHT PAGES.

Vol. XXXIV.—No. 11.

SAN FRANCISCO, SATURDAY, SEPTEMBER 10, 1887.

\$3 a Year, in Advance.
SINGLE COPIES, 10 CTS.

Glacier Point, Yosemite Valley.

The name Yosemite is Indian, and means "Big Grizzly Bear." The valley lies very near the center of the State, reckoning north and south; about one-fifth the way across from east to west, and almost exactly in the middle of the high Sierras, which inclose it. It is about 140 miles from San Francisco, in an air line. The main valley is seven miles long, and the bottom of the valley is about 4000 feet above the level of the sea. It is really a huge sink or cleft in a tangle of rock mountains; a gigantic trough, not scooped or hollowed out from above, but sunk straight down, as if the bottom had dropped plumb toward the center, having both walls so high that if either should fall its top would reach clear across the valley and crash against the opposite cliff several hundred feet above its base.

This cluster of marvels has been photographed by Taber, painted by Hill and Bierstadt, described by several eminent writers, and yet the traveler will say—as the Queen of Sheba, when she beheld the glory of Solomon—the half has not been told. The central figure of this group of wonders is, of course, the great Yosemite Fall itself. It is the loftiest waterfall yet known on the face of the earth, a cataract from heaven to earth, plunging from the clouds to bury itself among the trees. It awes the beholder into silence. Please say nothing about figures. When one is overwhelmed with emotions of sublimity to hurl statistics at him would be as disagreeable as a bath in ice-water. After a while, when his enthusiasm has cooled down a little, the cold calculator may venture to poke his mathematics into his face, and then he will learn that, according to the coast survey, the height is 2641 feet—a full half mile and one foot more. Gracefully swaying from side to side, in rhythmical vibration, swelling into grandeur in earlier spring, and shrinking into beauty under the ardency of summer heat; towering above all other cataracts, calmly abides this undisputed monarch of the world's marvels.

Horace Greeley, who entered the valley by moonlight, pays tribute to this type of eternal massiveness as follows: "That first, full, deliberate gaze up the opposite height! Can I ever forget it? The valley here is scarcely half a mile wide, while

its northern wall of mainly naked, perpendicular granite is at least 4000 feet high, probably more. But the modicum of moonlight that fell into this awful gorge gave to that precipice a

vagueness of outline and indefinite vastness, a ghostly and weird spirituality."

We present our readers with a view of one of these magnificent clusters as photographed by

partaken. One of them was valued at \$500. Owners of valuable stock may take warning.

THE raisin crop will be large.

GLACIER POINT, FROM RAYMOND ROAD.

Taber, from the standpoint of the Raymond road. It overbrows the valley and commands a very extensive view that for grandeur and variety no pen can depict, and only the magic of the artist can limn to the eye. The persons seen on the verge of the dizzy promontory are Mr. J. M. Hutchins, the well-known pioneer of Yosemite valley, sitting on the edge of the precipice peering into the depths below; Mr. I. W. Taber, the noted artist and photographer, is standing with his right arm extended in the direction of one of the waterfalls higher up the valley.

Others of the party may be seen seated upon the dizzy height. To this extreme point a zigzag road has been cut up the mountains by Mr. James McCauley, so that it is safely attainable by those who can command their heads in such situations.

The Yosemite valley is about 4000 feet above the sea. Its general course is northeasterly and southwesterly. The main Merced river runs through it. In many instances the walls of the valley are nearly vertical. The mountains surrounding it will average 4000 feet in height.

THE PACIFIC RURAL PRESS is conceded to be the leading California agricultural journal, and it puts forth every possible effort to secure the fullest and most trustworthy information concerning California lands and their practical working. Thus it becomes the leading source of knowledge concerning the pursuit of agricultural arts under the peculiar conditions which prevail here. We make this statement for the benefit of any new-comer who may receive a copy of our journal at the fairs or otherwise, and for proof of the truth of what we say, we refer to any regular subscriber. Our subscribers are our best friends, and the State is full of them.

BEWARE OF WILD PARSNIPS.—The Santa Rosa Democrat mentions the fact that two of M. L. McDonald's finest horses were recently found dead in their pasture. The only cause to which their death could be assigned was the presence in the field of the poison parsnip plant, of which they must have

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Ojai Valley, Ventura County.

EDITORS PRESS:—On leaving San Buenaventura for the Ojai country, we drive up the narrow valley of the Buenaventura river, along that beautiful among all roads, "The Avenue." For about seven miles we are surrounded by handsome residences and orchards of various kinds of nut-bearing trees and fruits, the principal being the European walnut and the apricot.

About one mile north of San Buenaventura, we halt and have the pleasure of shaking hands with our good friend, H. P. Flint. Mr. F. used to take much pride in rearing and keeping Spanish merino sheep, and we have in our possession photographs of some very fine sheep—bucks, ewes and lambs—raised by him years ago, when he triumphed in the production of the very finest and best. We are shown a small remnant of his once fine flock, consisting of one ram, Theo Tilton, aged three years, and a few ewes, all showing the finest type of the Spanish merino. These are only kept as a kind of luxury, land on the Buenaventura river, this near the county seat, having become of too much value to admit of Mr. Flint's indulging, at this place, in one of his favorite pursuits, that of rearing first-class sheep of best blood.

Points About the Ojai.

We enter the valley of the Ojai from the southwest, at about 15 miles north of San Buenaventura. The whole valley is about eight miles long and 1½ to two miles wide. Its general trend is nearly east and west, and it is divided into the upper and lower valleys, the lower or western being at an altitude of from 800 to 900 feet, and the upper being, perhaps, over 100 feet higher.

We are struck with the beauties of the valleys: its grand features; its park-like appearance; its hills and dales; its slopes, all here and there partially covered with trees and groves of live and white oak. Mountains grandly rise on either side of the valley, those to the south belonging to the noted Sulphur range, imposing in their majesty, those to the north being members of the long Coast Range system, at this place rising to an altitude of more than 4000 feet, and opposite the upper valley, culminating in the lofty, rocky summits of Mount Topo-topo.

The air seems balmy and health-inspiring. Heavy fogs are not often attracted to this high valley, and the place is considered remarkable for its healthfulness.

The soil of the lower Ojai is a sandy loam and slightly reddish in color. That of the upper is mostly adobe, of black color and quite rich. While fruit trees of various kinds thrive and bear well in places in the upper valley, the most remarkable yield is in grain, as high as 50 or 60 bushels per acre of wheat having been harvested. While the lower valley may not be quite so rich, yet its wider range of products gives it some compensating advantages.

Citrus Fruits.

In the lower valley, at what is known as the Lyndencroft ranch, some three miles north of San Buenaventura, at an altitude of about 900 feet, Prof. F. S. S. Buckman and wife have shown the capabilities of the neighborhood in the production of oranges and lemons, and lemons, and have gone far toward establishing a reputation for the valley in the successful culture of many other fruits.

Besides other kinds, their orchard comprises about 600 orange trees in bearing. The varieties are the Washington Navel, Mediterranean Sweet, Havanna Sweet, Konah, Malta Blood and Lyndencroft seedling. The last-named is a new seedling, very large and round, with thin skin, and having a bright, rich orange color, of very excellent flavor, already celebrated in the markets of the State and sold at the highest prices. Oranges from this orchard generally retail at orchard, Nordhoff or San Buenaventura, for 50 cents per doz. Boxes of select fruit bring from \$5.50 to \$6 per box, and Mrs. B. informed us that their oranges never sell for less than \$4.50 per box.

The trees as yet appear to be perfectly free from scale or other pests, and we see no rust on the fruit. We believe it was never our lot to witness more healthy trees and fruit. A healthy orange tree laden with large golden fruit is ever an interesting object; but we have to specially mention the stately trees and handsome fruit of the Lyndencroft seedling. It would seem from what we see of this variety, that it deserves particular attention of orange-growers, at least in such situations as we have here, and it might turn out to be an important variety, at any place in this State where the orange is successfully grown.

The lemons are of the Sicily and Eureka varieties, both very thin-skinned. Professor B. ships to Dalton Bros., S. F., and they report that his Sicily lemons are nearer the imported Sicily lemon than any California raised of that variety that they have ever handled. His sales were \$2 50 per box.

They have at this place sufficient water for irrigation of the orchard, an advantage not enjoyed by a great many places in the valley,

and a consideration of vital importance in the selection of a citrus fruit-ranch.

Mrs. B. informs us that of fruits that do well at this place, we may mention apples, pears, peaches and cherries; that cherries have borne good crops three successive years, but then had to be cut down to give place to oranges, which are considered a more important fruit.

Experiments With the Cherry.

As the cherry is not grown with success in most places in this and Santa Barbara counties, the question suggests itself, might not this valuable and popular fruit be made a very profitable subject of cultivation, in a place having the proper conditions for its growth and fruitfulness? The orchards of the Ojai valley are generally young, and but little is yet known of the capabilities of the locality for cherry-growing. The orchardists here have the discouraging failures in most parts of the county confronting them, and, as far as our observation extends, the cherry has, thus far, received but little attention.

They have French prunes in this orchard, but most of them too young to bear. Three older trees, however, have borne heavily for three years in succession.

Among the small fruits, they have succeeded well with currants. They have one acre planted to blackberries—the Lawton and the Kitchinny—reported to be very large and sweet and in good bearing every year. Three-fourths of an acre are devoted to the strawberry—Wilson's Albany—which is cultivated in rows, and proves to be very prolific.

Ten acres of the Muscatel grape for raisins, five years old last spring, have now borne three years. The last year was the first attempt at raisin-making. All are sun-dried, the atmospheric conditions in the fall of the year being very favorable to this process of curing.

Apricots.

B. F. Spencer, living one mile east of Nordhoff, has apricot trees of the Royal and Large Early varieties this season too full of fruit. Last year they were too young to bear well but had on them half a crop. Peaches and nectarines with him promise to be a great success, bearing from one year up. French prunes look vigorous but are too young to bear fruit. Figs do well as far as tried in the neighborhood. Some others have commenced to cultivate raisin grapes and the success attending the curing in 1886 is very encouraging.

The water supply of the valley is insufficient for much irrigation, but, considering the success thus far attending the cultivation of many crops, the prospect for the future is very encouraging. The conditions for grain-raising are in some places very superior while the fruits that may be grown are of most excellent flavor. Citrus and other fruits requiring irrigation may be successfully and profitably grown in many places where water in sufficient quantities for irrigation purposes is obtainable.

It would seem, from what is known of the condition necessary to the growth and fruitage of the olive, that this valley might be made a great olive-growing district. The olive may do without irrigation and the soil and climate would seem to be most favorable.

The Apiary.

During many years bee culture may be engaged in with profit. S. C. Gridley, on the high slope of the north side of the lower valley, has quite an apiary, and is very successful in its management. The mountain-sides abound in honey-yielding plants, nonproductive this year, however, as they are all over this country.

Nordhoff and Vicinity.

Nordhoff is a small town of good appearance, situated at the west end of the lower valley, about 18 miles from San Buenaventura, with a well-graded road leading to that place, and with which it is connected by daily stage; has a postoffice, two commodious hotels, and the usual supply of stores, shops, etc., also a good churchhouse and school.

We spent a day some two miles east of Nordhoff, at the residence of A. C. Rynerson, situated on the slope, south side of the valley at the foot of the mountains, enjoying the hospitalities extended by his generous family, and will long remember that serene day with its fresh air, and the time we spent sitting under the ample shades of the great live oaks standing near the dwelling, enjoying the delightful view of the beautiful valley and the partially wooded slopes, and the mountains standing in their imposing grandeur opposite. Mr. Rynerson's is a new place, his orchard young, and the capabilities of his grounds, as yet almost untested, but considering the dark, rich soil and the luxuriant growth of things planted and reared thus far, and furthermore his supply of good water, sufficient for all ordinary purposes, and other useful and attractive features that may be included, we may fairly congratulate him and family on their having obtained a place by nature so well fitted for a permanent home.

Ventura Co.

McD.

The Southward Coast.

EDITORS PRESS:—The region lying between Lompoc and San Luis Obispo, between the coast and high mountains, and including the hilly sections, is sure to become rich and prosperous and a land of beautiful homes. The cutting-up process has commenced on some of the great ranches, and as land values advance

it will be likely to continue and increase in activity.

In the above section many important improvements have been commenced since last fall. A large hotel is projected at San Luis Obispo. A new town, called "Grover-by-the-Sea," has been laid out, many lots sold and a large hotel is soon to be built there also, two schooners having already discharged their cargoes of lumber.

At Arroyo Grande they are organizing an agricultural association, and I suppose will soon have a park with race-track and pavilion for holding fairs.

Some lands in and about the town are to be divided into residence lots, and as they are choice, will no doubt be disposed of very quickly.

The town of Nipomo, on the great Nipomo ranch, began a rapid growth last winter, and now there are many new dwellings and quite a population, where last fall there was no store nor even postoffice. Beside the many dwellings, a much larger schoolhouse will soon be built to cost about \$6000.

A wooden block of business-houses is now in process of erection, which will have a frontage of about 100 feet.

A company has already been organized to pipe water through the streets. Several carloads of pipe are now here for that purpose, and much of the ditching has been done.

At Santa Maria the real estate market seems quite active, and some building is now going on, a large schoolhouse having just been started.

At Los Alamos and Santa Inez also the work is going on, large tracts having been bought for the purpose of subdivision.

So all along the line, from Santa Barbara northward, we can see increased activity. This is a good country, and it is bound to be a rich country.

G. R. STONE.

Nipomo, Aug. 19, 1887.

The Foothills of Tehama.

EDITORS PRESS:—In my recent rambles in the foothills of Tehama county I was forcibly reminded of the saying: "The first shall be last and the last first." A section of these foothills, some of it unpleasantly rocky, and other portions thickly covered with brush, which has until recently been given over to the browsing bovine is rapidly, and by its own merits alone—having had no meretricious aid from the professional boomer,—coming to the front as a place especially fitted by nature for self-sustaining small farms. Most of the settlers in this locality—the forks of Battle creek—have been here but a short time; yet if they should be cut off by any means from the rest of the world, they would need only to make looms and spinning wheels, make up their wool, flax and cotton into clothes, dispense with tea and coffee, and would then lack nothing that would be felt as a serious deprivation, barring perhaps the news from the outside world with its tales of murders, thefts, suicides, divorces, and such like delightful newspaper mental fodder.

An elevation of 1000 to 2000 feet gives superb climate, a deep red ferruginous loamy soil assures fertility, an abundance of springs, and dancing mountain streams laugh at droughts, and insure a yield of products that varies only as the labor and care bestowed upon them varies.

It is several years since, as a stockman I used to travel through this belt, and though I then recognized its possibilities, I doubted if in my time enough of the energy required to bring it into cultivation would be brought to bear. To see it now is a surprise—a revelation. Make a complete list of California's products, and but few, and they of the most tropical kinds, need be excluded from what can be grown here.

A pioneer of this locality, W. E. Hazen, commenced in a small way to test its suitability for fruit culture by planting a few apple trees some 10 or 12 years ago. They are now 15 inches in diameter. The rapidity of growth pleased and astonished him. He has since occasionally added more trees and more varieties. He has now all the staple fruits except those of the citrus family, and their present condition as to size and healthfulness is something of which he may well be proud.

His French prunes and apples, planted in the spring of 1885, have a circumference of 12 to 15 inches of trunk. The crops that help the young settlers along until their fruit trees bear are the redoubtable bean, the excellent spud, and alfalfa "til you can't rest." It is estimated that this neighborhood will spare about 3000 sacks of beans this season. Besides these, they have now growing fine crops of corn, cabbages, tomatoes, and everything usually grown in a well-regulated garden. There is plenty of this land for sale at very low prices.

Following this mountain stream to the river we come to a few of the oldest-settled farms in this county, and of a quality of land that has no superior in the State, if in the world. Here A. C. Nunes has corn, unirrigated, 14 feet in height, with great ears eight feet from the ground; alfalfa as prolific as can be found anywhere; fruit trees and vines of astonishing size, and a great variety of garden products that "can't be beat."

E. W.

Red Bluff, Aug. 31.

THE boring of artesian wells in Sierra Valley has been attended with success and some heavy producing ones have been found. This will guarantee a heavy increase in the acreage of cultivated lands next season.

THE VETERINARIAN.

An Infectious Mouth Disease.

EDITORS PRESS:—Although the word "actinomycosis" may seem to some people rather long, it is expressive. By it we understand that oxen are subject to a disease due to the work of vegetable parasites, which, from their eccentric radiating structure, have received the aforesaid name. The tongue becomes indurated, and tumors are seen on it and the mouth. Many stock-farmers will have noticed beasts so affected without being able to give it a name or discover the cause. Attention is first called to it by the animal "slavering" profusely, champing and chewing all hard fodder, and dropping it again, utterly incapable of masticating it. "Something wrong with the teeth," is generally decided upon as the cause, but when the mouth is examined, the tongue is found to be enlarged and imbedded with indurated yellow nodules, either toward the tip, or more often at the middle third, or, in some cases, the bottom jaw underneath the tongue is the part affected. In some parts of the world, of late years, this disease has been very prevalent, and it has been satisfactorily demonstrated that it is due to this interesting vegetable parasite. Botanists have not yet satisfied themselves as to the class to which it belongs, and it has been described as belonging both to the "moulds" and to the same order as the rust and smut in wheat. The fungus is contained in tufts within the yellow nodules, which, on being cut through, seem of a soft cheesy structure, though others are gritty to the touch, and this is said to be due to their impregnation with lime salts. The disease is infectious, and generally more than one case is found to exist upon the same farm. Once established in any situation, the actinomycosis spread by the development of spores which disseminate, fructify and produce more nodules. Its transmission from one animal to another is supposed to be by the spores, gaining entrance to a wound, abrasion or fissure in the tongue or mouth.

It is also said that the animals most affected are those fed on straw or chaff, this, by its roughness, is calculated to injure the mouth and provide an abraded surface by which the spores may gain entrance. Besides straw is often mouldy and infested with vegetable parasites, and this fact may account for its introduction. These tumors are not absolutely confined to the tongue and mouth, although they are generally met with, or at least are more readily recognized in that situation. The spores may gain entrance and fructify in the windpipe, lungs, stomach, and intestines, and have been found in the skin, muscular tissue, and also in the udder of the cow.

Treatment.

Until within a year or two ago, the disease was deemed incurable, and the custom was to destroy the animal as not likely to do any good, the inability to feed rendering fattening for the butcher a tedious if not an impossible process. If the animal is in good beef condition, there is no doubt that immediate slaughter is the most economical course to take, even now, since the cure is a long and troublesome matter. But in the case of pedigree and lean stock, treatment should be undertaken, and if persevered in, there is every prospect of success. Superficial applications are altogether useless, and the animal should be cast and secured, and the nodules cut into, a free incision being made, and then dressed with iodized phenol, which is generally made by mixing equal parts of tincture of iodine and carbonic acid. The injection of the substance of the mass with the same mixture with a hypodermic syringe, has been tried with success; but when the disease has been situated far back it is impossible to reach it thus. During the treatment the strength and condition must be maintained with soft nutritious food, such as mash and linseed gruel.

A Suggestion to Breeders.

Wholly apart from the foregoing there is one point in reference to breeding that I intend particularly to touch upon, and I very much wish that other practical men would discuss the subject. I refer to the fact of the exhaustion of the male being the frequent cause of mares not proving in foal, and thereby causing great loss and much disappointment. Owners of valuable stallions often use them too frequently for breeding purposes. Of course, it is not easy to lay down any hard and fast rules, but most breeders know how many mares may be served by an individual horse during the season without detriment. At any rate, any reasonable man knows that stimulants and excess are injurious, and, although a few extra dollars may be made, it is like "killing the goose that lays the golden eggs." Some owners appear to imagine that they can, by feeding and drugging, immensely increase the secretion, but nature will be avenged; and, admitting that it is possible somewhat to hasten the formation of this fluid, yet it is at the expense of some other organs and general harm to the constitution, and possibly, if the mare is impregnated, the offspring will be puny and delicate.

ROBERT J. DAWSON,
Veterinary Surgeon,

225 Geary St., Aug. 30, 1887.

SHEEP AND WOOL.

Thoroughbred Merinos.

Whether the Darwinian theory of development is correct or not, the experiments made by that scientist to show how readily the different types of birds and animals are changed by the process of selection and environment have been of great use to those interested in the improvement of our domestic animals, and additional examples are being constantly furnished by intelligent breeders. The gradual lowering of the record of our trotting horses is conclusive evidence that the mating of sires and dams having the trotting tendency produces a considerable percentage of colts that have the disposition to move rapidly in the unnaturally fast gait of the modern trotting horse. The same principle applied to the improvement of that useful little quadruped, the sheep, has produced results as marked as the changes made in any other domestic animal, but without attracting the public attention, that is caught by the lowering of the record by the produce of some great sire of trotting or running horses.

Our engraving of a group of thoroughbred merino ewes, which is furnished us by Messrs. Kirkpatrick and Whittaker, of Stockton, illustrates our argument. The beautiful models of sheep which the portrait presents show what vast improvement has been made during the present generation in the character of the thoroughbred merino sheep as compared with the bare-headed, slim-necked, long-legged creature which is pictured in the Patent Office reports of forty years ago as typical of the Spanish merino. Messrs. Kirkpatrick and Whittaker have made the breeding and care of thoroughbred sheep their lifelong study, and the prominence attained by their flock has been justly earned by their perseverance through the years of depression that has borne most heavily on the owners of stud flocks.

During the dull times the average sheep-man neglects all improvement, and especially when the rise in the value of land is great, and the grazing area from various causes is constantly being curtailed, as is the case in California, there is not the same interest taken in breeding up a flock as there has been under other conditions.

In spite of all drawbacks these gentlemen have held to their thoroughbred sheep, selecting their stock rams out of the famous flocks in the East, and improving them mostly by changing their indolent disposition, acquired by the pampered care given them by Eastern breeders, to the more useful quality, to the range flock-master, of rustling for themselves. As the thoroughbred horse shows greater powers of endurance than the cold-blooded animal, we suspect that under proper development the same results would obtain in the breeding of thoroughbred merinos. Be that as it may, the general satisfaction given by their stock to those purchasing, and the wide reputation they enjoy, has made a demand for their rams that extends even to South America, two shipments having been made to Buenos Ayres the present season and the prospect is good for future exports in the same direction.

Successful breeding, intelligent management, enterprise and push in extending the market for their stock, must develop a business that will be reasonably profitable to the owners as well as advantageous to the wool-growers of the entire Pacific Coast.

Protection to the Wool Industry.

The Ohio Wool-Growers' Association, at a meeting in Columbus, Ohio, September 1, adopted a series of resolutions respecting the correspondence had between the president of the association and the president of the Association of Wool Manufacturers, and fully indorsed the action of the president of the former asso-

ciation. The resolutions cite that the manufacturers who consume large quantities of foreign wool are not in sympathy with the domestic producers and are unwilling to see them protected by National legislation, so as to enable them to compete with the products of foreign nations, and that it was by their advice that the tariff legislation of 1883 was initiated and consummated. By this act they claim that sheep husbandry in the United States has ceased to be remunerative. They therefore resolve that it is the sense of this association that the wool-growers of Ohio desire the prosperity of the wool manufacturers, and therefore favor such economic national legislation as will fully protect their important

most earnest and diligent promoter of the mohair industry. Visitors at the Mechanic's Fair in this city will find one of Mr. Bailey's Angoras in a neat little pavilion in the Santa Clara county exhibit, the pavilion being covered and adorned with goat products of all kinds, which will give one an opportunity to study the many and elegant uses to which the skin and hair of the goat are being put. There will also be fine Angoras on exhibition at the State Fair by different breeders. All interested therein should attend the State Fair and the goat-breeders' meeting which will be held during the fair, as per notice by the secretary, which may be found below. We take pleasure in attending these meetings, as they are very

YEARLING ANGORA BUCK ALTAI, OWNED BY C. P. BAILEY OF SAN JOSE.

industry, and such just rulings by the Treasury Department as will give legitimate force and effect to all laws in aid of the same, and that in the opinion of the association all manufacturers of wool who do not consume considerable quantities of foreign production are fully in sympathy with the producers of wool in the United States, and are willing to see domestic wools fully protected.

interesting, and we advise all goat-breeders to avail themselves of the opportunity given for consultation and friendly conference.

Sheep, Goats and Forestry.

EDITORS PRESS:—I have just been reading in your valuable paper the report of the conference of the State Board of Forestry.

GROUP OF THOROUGHbred MERINO EWES OWNED BY KIRKPATRICK & WHITTAKER OF STOCKTON.

The resolutions concur in all resolutions adopted at the St. Louis convention, and especially the one proposing that a committee be selected by the president of the National Wool-growers' Association to confer with a committee of the wool manufacturers, the National President and the president of the Ohio association to visit the East and ascertain if the manufacturers are willing to co-operate in harmony with the producers.

A Fine Angora Buck.

We give on this page a portrait of the fine yearling Angora buck Altai, bred and owned by C. P. Bailey, of San Jose, well-known to our readers as the largest owner of Angora goats, and one of the oldest breeders in the United States. Altai has yielded a fleece which weighed seven and one-half pounds washed mohair, and is a fine representative of the breed. Altai was bred and raised on this Coast. Mr. Bailey has now about 10,000 head of Angora goats on his three ranges which are at Battle Mountain, Nevada, and in Monterey and Mariposa counties, in this State. He is a

Those who have spent a great part of their lifetime in the forests of California, and have had in charge bands of sheep and goats, will have to differ from Mr. Magee in regard to these valuable animals destroying the young forests, for we know that the conifers are not the food of either sheep or goats—in fact, these animals save forests by destroying the chaparral and other useless undergrowth, and making trails and tramping the litter so that great fires cannot burn so fast and are not so liable to catch.

There are hundreds of acres of waste lands in the State, covered by brush and timber, that would be worse than worthless if not used as pasture for sheep and goats for about four or five months of the year.

A great amount of the food and clothing of the State is derived from sheep and goats, and to close (our) Uncle Sam's vacant hand against their use would reduce the production to a very great extent and would stop the production of mohair in its infancy after long years of hard work and study by the pioneers of the industry, for the mountains are the home of the goat.

We do hope that the Honorable Board of

Forestry will not advise the passage of that will reduce the growing of food and clothing unless they are sure that it would be for the best interests of the greatest number.

Newville, Colusa Co. M. L. CONKLIN.

Goat-Breeders' Meeting.

The Angora Goat-breeders' Association will hold its annual meeting on Thursday, Sept. 22, next, at Pioneer hall, at Sacramento. Members and breeders invited to attend.

JULIUS WEYAND.

Sept 1, 1887. Sec'y A. G. B. Ass'n of Cal.

POULTRY YARD.

Chickens and Eggs in Southern California.

EDITORS PRESS:—Let me give you a few facts and figures on raising chickens and egg in Southern California.

On December 23, 1885, Miss Jennie Higgins, who was in poor health and wished more outdoor exercise, concluded to attend to the chickens and eggs and see how much ready cash she could get in one year. The following is the summary:

Eggs sold from Dec. 23, '85, to Dec. 31, 1886 \$158 00
Chickens sold during same time 77 80
Total cash receipt of 235 80

She commenced with 75 hens of mixed breed, some black, some yellow, some white and some speckled. About that time I bought five Plymouth Rock roosters of good size and color, and at the end of the year Miss Jennie had 80 nice young pullets all showing the Plymouth Rock markings, and a nicer lot of young hens it would be hard to find.

Now for the first eight months of 1887:

Eggs sold \$134 80
Chickens sold, same period 46 60

She still has on hand some 40 hens, from one to two years old, and some 300 young chickens from a few days to eight months old. This was over and above what was used to supply a family of ten persons, with all the eggs and chickens used during the 20 months, which we think would much more than pay for the feed consumed.

We find that, summing up, Miss Jennie started out with 80 chickens, worth \$40, and has sold in the last 20 months \$417.20 worth of chickens and eggs, and has on hand 340 hens and chickens, worth \$120, from which deduct

\$40 and we have \$497.20 as pay for her work and trouble. She uses no incubator, but has made the hens do all the hatching. What young lady in the east, north or south can make a better showing in the poultry business? We would be glad to hear from others.

P. C. H. Carpinteriu.

FEEDING FOR FLAVOR. —Ever and anon some enthusiastic breeder of thoroughbred fowls descants upon the merits of his favorite breed — "their tender, juicy

flesh and rich, highly flavored eggs, not to be compared with the dunghills long ago discarded" — forgetting that the dunghills were truly named, and that from hard scratching for a living in the barnyard, they produced the small, tough bodies and ill flavored eggs complained of, while his thoroughbreds have a yard to themselves, are fed on the choicest grain and grasses, have nothing but pure water to drink, and all the "delicacies of the season," from the dinner table. What breeder has not noticed the difference in flavor of the eggs from his best yards and from the general flock running at large? Instinctively, the best fowls receive the best food and most careful attention, and the result is richer and better flavored eggs. Feeding for flavor must sooner or later become one of the high arts of poultry culture.

THE San Luis Obispo Mirror says: The subscriptions toward purchasing the McCoppin tract for the purpose of an agricultural association already amount to \$13,000, and enough additional is assured to warrant the members of the Park Association to immediately begin improvements on the exhibition houses,

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Temescal Grange.

This Grange worked in the first and second degree on Saturday last. The meeting was favored by the presence of Judge Blackwood of Haywards and Bro. J. V. Webster from San Luis Obispo county.

Judge Blackwood being called upon, spoke of the importance of the approaching State Grange meeting, saying that he believed it would be one of the most interesting and important ever held. Among other questions likely to come before the members would be that of taxation and the tariff question. He stated that we all know that the price of the farmers' wheat is governed by the rates in Liverpool, and queried why farmers should pay a tariff on the importation of bags which principally were used to return again to the foreign market for conveying the grain. In his mind, parties wishing protection by tariff should be able to inform us what they intended to give us in return for such protection. Why should anybody be protected unless they returned some benefit. He hoped the attendance would be large at the State Grange and all be well prepared to act.

Brother Goodenough stated that in some instances projectors of new enterprises, of benefit and importance to our country, were protected in order that, as home manufacturers, they could get a footing to compete with those of foreign countries, and thus establish a home trade that would show benefit to our people.

Bro. Webster asserted, very forcibly, that the greatest difficulty in securing legislation and justice to farming interests arises from the fact that farmers always stick closer to party lines than to each other. When this difficulty is overcome we can look for more justice and impartiality from our law-givers. He showed that farmers were taxed item by item, while merchants give their stock in in a bulk statement, whereby they are comparatively much less taxed. Judge Blackwood stated that in England, which has free trade, rates of labor have increased within a few years 40 per cent. In Germany, where everything is protected by tariff, the rates of labor have been, in the meantime, greatly reduced.

Bro. Webster, who is home on a short visit, stated his regret at not expecting to be able to attend the State Grange, which was much regretted. All hope he may do better than he promises and be present yet.

The members of Temescal and Eden Grange will remember the pleasant visits made their Grange some years ago by Brother and Sister D. Woodman from Michigan. All were sorry to learn that Sister Woodman had recently died. Secretary Babcock read a series of beautiful resolutions adopted by her local Grange, which were listened to with much interest. Temescal Grange instructed its secretary to express the sincere sympathy of its members with Brother Woodman, his family and Grange, for their great loss.

Miss Lucy Blackwood, residing in East Oakland, daughter of Judge Blackwood, is expected to receive the third and fourth degree on Saturday, September 17th, when the usual Harvest Feast will be celebrated. The meeting will take place at 10 A. M. Eden Grange and other Patrons are cordially invited.

State Grange.

The State Grange meeting will commence the first Tuesday in October. There will be a large attendance. All who have not visited the healthful, beautiful city of Santa Rosa should improve the opportunity to attend the State Grange.

There will be a liberal reduction in railroad rates from San Francisco, and all the hotels have agreed to reduce prices, which will be published next week.

Let every person who expects to attend the State Grange keep an eye on the RURAL PRESS and the California Patron, for through these the news will be furnished.

BRO. W. L. OVERHISER of Stockton, W. O. of the State Grange, met with a painful accident on Sunday, August 28th, by which his only servicable eye was entirely blinded for the time being. Accompanied by Sister Overhiser he came to San Francisco Tuesday, and placed himself under the care of Dr. Pardee, the eminent oculist, who encourages him to look for a perfect cure. Meanwhile, however, he is compelled to give up most of his work for the beloved Order, and to forego a deal of sight-seeing at the autumnal fairs. But he prizes the friendship and sympathy of his brother Patrons in this season of deprivation, which all will join us in earnestly hoping may prove as brief as possible.

GRANGE ALTERNATES.—Every Grange should choose alternate representatives to the State Grange who will act in case of the non-attendance or possible disability of the Master or his wife during the session. Granges whose Worthy Master is unmarried, should take special care to elect alternates to the State Grange.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

"The prosperity of the South is, without doubt, confined almost exclusively to the cities. The farmer's condition does not improve." This item from a Southern paper really gives the condition of affairs over the whole country. As proved by the U. S. Census and all later statistics, the depression of agriculture is growing greater with every passing year. The value of the farm and its crops is constantly shrinking. And yet the country was never increasing in wealth so rapidly as now. Why should agriculture be the only interest that is going backward? What are the causes? What the remedy? These are questions that should be discussed by every Grange in the land. Would it not help if farmers were as well organized as the manufacturers and other city interests? Would not "protection" for our products, in proportion to the protection given other industries, help us? If "protection" has built up these other industries and made them prosperous, would it not be well to build up agriculture in the same way and put good tariffs on fruits, hides, eggs, vegetables and other products now admitted free, and larger tariffs on hay, lumber, potatoes, wool, tobacco, sugar, etc.? True, we have a large surplus revenue now. If more than is needed for expenses of the National Government, why not divide it up among the States to run the State Governments (as was done when Andrew Jackson was President) and so save State taxes; or, if necessary, divide again among the counties and so save county taxes? Some recommend free trade, but would it help farmers to pull manufacturers down to the farmers' depressed, almost free-trade basis?

To protect her farmers, France has tariff on beef, pork and grain, so high that it is prohibitory, and last winter the French Congress increased the tariff on raw sugar at the very time our Congress was discussing free raw sugar (and all "free" raw materials). Spain increased her tariff on cereals last winter 25 per cent. Statistics tell us that over 16,000,000 dozen foreign eggs (largely from France) landed in this country last year free of all duties. If France and Spain, by tariff, close their markets for our beef, pork and grain, let us close ours in the same way against their pauper hens. Let us try a tariff of 78 per cent on eggs (the average on manufactured goods) and see if you cannot build up this "American Industry."

"ACCOMPLISHED its mission, I suppose," was the reply in one of our leading newspapers recently to the inquiry, "What has become of the Grange?" "Accomplished its mission!" When farmers cease to know want, and become independent of human sympathy and fraternal counsels; when their isolated homes shall have been brought into union with teeming companionship; when farmers shall have ceased to be hewers of wood, etc., to other callings, and peace and plenty crown their boards, and the lion and the lamb among mortals lie down together in the evergreen pasture of mutual rights, then may we talk of mission accomplished. There is an urgent necessity for just such an organization as the Grange now as in former years, and every true Patron will echo the earnest wish that every farmer in the Union would join the Grange. Its teachings rest their foundation upon the "Book of Books," and as well tell us the church militant has accomplished its mission. Erase, if you please, the name of Grange from the lexicon of time, and the thousand syndicates which it has formed in the hearts of its faithful adherents will find as many tongues to utter its praise.—Farmers' Home Journal.

To make the Grange fill its mission, there must be active fathers and mothers, who have the love of man and country at heart. In order to wield an influence, they must co-operate in the same manner that we do to carry on a church or school. They will soon perceive that their sons and daughters are essential personages to carry out their objects. Get American people to talking over a matter, and they will ferret out the truth. If, then, there is right in the matter, agitation will bring it out, and agitation brings action. Let farmers come to the Grange, and profit by experience.—H. E. Hayes, Oregon.

THERE is a great work before the Grange throughout our country and the whole world, in combatting the twin evils of monopoly and socialism. "Twin evils," I say, for a Jay Gould or any man who does his stealing under cover of law, sows dragon's teeth from which spring up not only armed men, but men fearing neither God nor man, men who would overturn all government, reduce order to chaos, blot out civilization and bring back a worse barbarism than that which our forefathers found here, when they first came ashore from the Mayflower. But Jay Gould and the class of which he is a worthy representative and the socialists are alike, are in fact all off the same piece, in that they all want ten hours pay for eight hours work; or to sum it up concisely, they want to obtain the things they desire without rendering therefor a just equivalent. The Grange is non-partisan, and God grant that it may always remain so! It is must stand firmly for honest pay, for honest work, and set its face as a flint against all injustice.—E. M. Gillard, Connecticut.

THE Master of the Vermont State Grange says: "We are steadily gaining ground, and there seems to be a strong popular sentiment in favor of the Grange in all parts of the State. In several sections there is a call for organization and reorganization."

THE Grange Insurance Co., at Lime Ridge, Pa., has insured the buildings of its patrons at the cost of \$1.16 for each \$1000 per year, or \$5.83 per \$1000 for each five years' term.

SANTA ROSA GRANGE will confer the third and fourth degrees on Saturday, Sept. 10, 1887, at 10 A. M. They will celebrate the Harvest Feast and have a grand time. The members are all busy preparing for the State Grange.

Equitable Taxation.

At the last convention of the Farmers' Alliance in Syracuse, N. Y., the following preamble and resolution were adopted:

WHEREAS, 89 per cent of all taxes is now raised on real estate and only 11 per cent on personal property; therefore, be it

Resolved, That the laws be changed to make the distribution of taxes just and equitable, and that all persons be made to disclose the amount of their personal property to be subject to taxation.

Whereupon the S. F. Call makes these comments: If the preamble to the resolution is correct, there is but little for the United Labor party to do. If 89 per cent of the taxes is levied on land, the United Labor party have but to proceed a little further in the same direction. But the preamble probably refers to direct taxation. The taxes to support the National Government are placed on articles of consumption, and are included in the price of such articles. A man cannot pay his own way and not contribute to the support of the Government. There is a measure of justice in the demand of the Farmers' Alliance. Personal property in all the States conceals itself from the tax-gatherer. It is more easy to denounce such concealment than to prevent it. Land and improvements are always in sight, but bonds are hard to find. The true theory of taxation is to assess property on its full cash valuation without regard to the form it takes. The practice of assessing property at 30 to 40 per cent of its valuation, and money and bonds at their face value has been the cause of much of the deception practiced to conceal property.

COME, BOYS AND GIRLS.—"We offer you the Grange with its pure associations and influences. We offer you the educational, the social and the material advantages of association with those who have for years labored with tongue, pen and brain for your elevation." Come, then, boys and girls, to the Grange; come for your own good and for our pleasure. We have no selfish ideas, no sinister motives. We feel that you cannot afford to stay away. Time is too precious, youth is too short, the responsibilities of life are too great to admit of delay. Here we will give you amusement without temptation to evil, recreation without frivolity, instruction without tediousness, and all the advantages of social intercourse with none of those evil communications which corrupt good manners. Come, then, and take your places in the line; you cannot afford to stand aloof. Soon you are to go upon the market, and generally you are to be sold upon your merits. We offer you, in the Grange, the information and education that will fit you for life's duties. The exigencies of the times demand men and women of well-informed minds, of well-trained ideas, of incorruptible integrity. No organization, association nor fraternity is doing so much as the Grange to give such to the world. Then, Patrons and Farmers, bring your boys and girls to the Grange, and thus let your most intimate associations be with those who are to be their associates through life.—D. H. Thing, P. M. Maine State Grange.

APPEARANCES WERE DECEITFUL.—Editor Reed of the Gridley Herald has recently been rusticiating among the Lassen hills, and the Mail tells a little story of what befell, while he was standing in front of the Stewart house one morning. Reed stood there, enjoying his pipe, when he was approached by a sheep-owner who wanted to hire some shearers, and asked if he wanted work. "Yes, I want work," said Reed: "How much do you pay?" "Dollar a day and board. You will make a good shearer, I think; you look like one now." "You won't rob yourself by paying \$1 a day and board?" "Oh, no; that's the regular price." "Well, I've got \$1.50 left and don't propose to work until that is gone," answered Reed. "That's just like you whelps! You stand around, claiming you can't find work, and when a man asks you to work you ain't on it. The authorities ought to put you in the chain-gang." The farmer was waxing wrath and a crowd began to gather, when a friend stepped up and introduced the granger. "Thunder! Why didn't you say who you were?" And then everybody smiled.

BRO. J. W. MACKIE sent us a note from Tulare last week, saying that he had been quite ill, and so prevented from writing for the RURAL and discussing questions before the Grange. This week, however, we have had the pleasure of seeing him here in San Francisco, in better spirits and improving health.

DR. C. E. STONE, the newly chosen president of the Anti-debris Association, is a well-known pioneer of Yuba county, and has been Mayor of Marysville. He has been from the outset a radical opponent of hydraulic mining, and is distinguished for integrity and firmness of character.

WORTHY OVERSEER OVERHISER and Brother E. Kelsey expect to be present at the re-organization of Merced Grange, Sept. 17th.

It is hoped there will be a full attendance at Tulare Grange which meets on Saturday, Sept. 17th.

FORTY couples enjoyed the Grange festival at Danville and report a good time.

AGRICULTURAL NOTES.

CALIFORNIA.

Butte.

PRODUCTS OF PARADISE.—Record-Union, Aug. 29: A sample of Stillson peaches has been sent to Sacramento from Paradise, to show the quality of fruit raised at that altitude. They were picked from trees which have been out but three years, and excel in flavor, size and marketable appearance. Mr. B. Russell, who sent them, states that apples, pears, plums and prunes do equally well there.

Contra Costa.

TREASURING STRAW.—San Ramon Cor. Item: Many of our farmers are stacking their straw. It may seem a little old fashioned to prepare for winter in this way, but it is a good thing for the stock. The rainy season has been uncertain of late years, and straw helps stock tide over the hard pulls when grazing is poor.

Fresno.

IRRIGATION PROJECT.—Expositor, Aug. 24: County Surveyor Davis has been surveying a preliminary route for a new irrigation canal. The plan is to take the water from Kings river at the point where the new channel takes out, carry it across on an embankment from 25 to 30 feet high in the lowest places and to the West Side lands. One branch of the ditch will be led south on the west side of Tulare lake, irrigating over 100 sections of land, while the main canal will be led south, and will cover about 400 sections of land. The canal will be 100 feet wide and 8 feet deep. After striking the West Side plain it will go out about three miles and then follow the contour of the country down to a point opposite Firebaugh's. The length of the canal will be about 70 miles. As soon as the preliminary surveys are completed they will be submitted to the projectors, who are from Watsonville and San Francisco, for their approval. There is little doubt that the work will be put ahead at an early date.

Mendocino.

POINT ARENA ITEMS.—Cor. Ukiah Press, Aug. 27: The hay crop is heavy and of extra quality. Baled is worth \$10 per ton. The grain crop is extra good in quantity and quality. A field of oats on W. H. Kent's place near Bridgeport, it is estimated, will yield 100 bushels per acre; other fields are estimated at 95 and 80 bushels per acre. The toot-toot of the thrashing engines can be heard from the coast to the foothills. Potatoes are looking finely, and no appearance of the dreaded blight up to this time. The crop is too far advanced to be injured should it come. Butter has boomed up to 32½ cts. per lb. in August, and may reach 40 cts. in September. As a natural consequence, the dairymen are walking around jingling their coin. Cows are about dry. A majority of the dairymen prefer half-bred Jersey cows for butter-making; the full bloods are so small.

Napa.

CROP NOTES.—Napa Register, Sept. 2: Wheat in general in the valley has turned out very well as regards both quality and quantity. The same may be said of barley. Oats that in the early season promised well were damaged from one-third to one-half by hot winds when the grain was in the soft dough. Since prices of grain declined a few weeks ago, farmers are disposed to hold for higher figures. Most of the hay has been baled, and considerable straw. The crop of hay was an exceptionally good one, and much of it has been stored either in town or on farms.

Placer.

PLACER PEACHES.—Republican, Aug. 31: Geo. Perkins sent up to office from his Newcastle ranch last Friday a six-inch box filled with 36 Chili cling peaches. They were from a two-year-old tree, and averaged as large as any seen this year, being 11 and 12 inches in circumference. Their quality would make a New Jersey man want to move into the U. S. Dr. H. H. Clark had three cling peaches the other day, each of which measured 13½ inches. Some specimens of free stones from his ranch measured 10, 11½ and 11½ inches. But there is not a peach orchard in the county which has not this year produced some remarkable fruit. If the Republican were to report every 12 inch peach the list would fill a column. Next year anything under 14 inches will not be considered worth mentioning.

Sacramento.

SECOND-CROP BARLEY.—Record-Union, Sept. 2: P. J. Van Loben Sels, manager of the S. F. Savings Union lands in the Pearson Reclamation District on the Sacramento river, was in the city yesterday, and had samples of the second crop of barley now ripening on their lands. The first crop yielded an average of from 60 to 70 bushels per acre, and the second crop will go from 50 to 60 bushels per acre. The second crop comes from volunteer sowing, the fallen seed from first crop having been simply harrowed over to scatter it upon the ground, and then plowed under. This crop will be ready for cutting in about two weeks.

NECTARINES.—Geo. B. Katzenstein [brought to the Bee office the other day several magnificent nectarines, picked from a tree in his yard on O street. They were of beautiful color and delicious flavor, and averaged 9½ inches in circumference.

A FIELD FOR CANNERS AND DRIERS.—Galt Gazette: On the McClaughry place there are

tons of fruit that will not pay for boxing and shipping. Henry Adams, an extensive fruit-grower, near Elliott, is under contract with a Sacramento cannery to box and deliver his peach crop at the cannery at \$20 per ton. Dr. Harvey's large orchard is full of fruit of the best quality, but as it will not pay him to ship it, the hogs will get what he does not dry and give away. Others who have fruit find great difficulty in disposing of it at a profit. There is only one way we can see out of the dilemma, and that is for an enterprising man to establish a cannery in Galt. There would then be a demand for all the fruit raised here, and an industry would be added to the town that would give employment to many of the young folks during the fruit season.

San Bernardino.

CHECKING DEFORESTATION.—Lugonia Citro-graph, Aug. 27: E. L. Collins of Oakland, a special agent appointed by the State Board of Forestry, has been traveling over our mountains, inquiring into the cause of our forest fires and the illegal cutting of timber on Government lands. The latter does not interest our people nearly so much as the former. Mountain fires have become a serious menace to the life of our perennial springs and artesian well basin, and must be stopped at whatever cost. All good citizens will join hands with the Forestry Commission and assist them by every means in their power.

San Diego.

POWAY PLUMS.—The Union is in receipt of a box of Kelsey's Japan plums, grown by J. S. Higby on his ranch near Poway. They are magnificent fruit—the largest measured eight inches in circumference—and are but another substantiation of the fact that San Diego's "back country" cannot be excelled as a fruit-growing region.

CAMPO CULLINGS.—Cor. Union, Aug. 27: Sheep-shearing is in full blast in the vicinity of Campo, yesterday and to-day upward of 13,000 being shorn. Coons are causing great damage to the corn and watermelon crops, and they seem to be almost as destructive as a band of hogs. On the 23d a forest fire was started near Potrero, and before its progress could be checked it had swept everything before it to this place, a distance of ten miles. No property other than valuable timber was destroyed. The flames drove dozens of fine large deer from the brush and quite a number have been killed.

San Joaquin.

HIS POTATOES KILLED HIM.—Stockton Independent, Aug. 30: Last Saturday evening Ah Lee, a prominent Chinese commission merchant, well known to steamboat men in this city, loaded several sacks of potatoes and other vegetables upon the steamer T. C. Walker, and embarked for S. F. with his goods, which were piled on the vessel's deck. Sunday morning, when the boat had reached her moorings at S. F., and the freight was being removed to the wharf, the dead body of Lee was found beneath a fallen tier of sacks of potatoes. The Chinaman had evidently crowded beneath the pile to sleep sheltered from the wind. His appearance indicated that death had resulted from suffocation.

Santa Cruz.

PAJARO VALLEY FAIR.—Pajaronian, Sept. 1: An adjourned meeting was held in the Grangers' hall on Saturday last, to consider and further the plans for holding a fair in Watsonville some time the ensuing fall. The attendance was quite large, many leading and influential citizens from both country and town being present, among whom was a large representation of ladies who manifested a lively interest in the movement. A. P. Roache was unanimously chosen chairman. H. S. Stipp was elected secretary. The Finance Committee reported contributions to the amount of \$118, with an encouraging prospect of increasing it to \$200 or \$250. The Committee on Hall in which to hold the fair reported that they had secured the Rink for that purpose. A motion that the time of the Pajaro Valley Fair be changed from September 15th, 16th and 17th to October 20th, 21st and 22d was carried. On motion of Mrs. A. P. Roache, it was voted that an Executive Committee of 12 be appointed, whose duty it shall be to take the entire charge and management of the fair. The following is the committee: Messrs. G. W. Sill, N. A. J. Dorn, H. S. Stipp, A. N. Judd, N. A. Uren, K. F. Redman and Mesdames Dr. Libbey, M. E. Tuttle, J. T. Porter, B. A. Osborne, L. V. Willits and A. P. Roache.

BARLEY CROP.—Among the heavy barley yields in Pajaro valley this season, a portion of the Atherton ranch, near Pajaro, yielded 119 bushels to the acre, while Thos. Kennedy's farm, also near Pajaro, harvested over 100 bushels to the acre. How do those returns show for a dry year?

Solano.

SOLANO AND NAPA FAIR.—Suisun Republican. The directors of the Twenty-fifth Agricultural District met at Vallejo August 20th. A. T. Hatch of Suisun moved that the fair be held at Vallejo. Seconded by Jas. Cline of Benicia, and carried unanimously. F. W. Loeber was elected permanent chairman, A. J. McPike permanent secretary, and the Vallejo Savings and Commercial Bank treasurer. The board of directors then turned all arrangements for the fair over to an association to be immediately formed, and adjourned. After their adjournment a number of citizens met and instituted the Solano and Napa Agricultural Fair Association and organized by electing Alex. Scott, Jr.,

president, Thos. Smith vice-president, A. J. McPike secretary, and the Vallejo Savings and Commercial Bank treasurer. It was decided to hold the fair on the 4th, 5th, 6th and 7th of October—the races and stock exhibit at Agricultural park and the pavilion display at Armory hall.

AN EFFECTIVE BALER.—Geo. McDermott has a lightning hay press which does the prettiest work at baling we have ever seen. The power comes from a team of horses just in front of the press, and runs a derrier fork which throws the hay upon the table. From here it is thrown into the press by the tableman and pressed solid by the falling of a weight of 1100 pounds of iron. When there is enough in for a bale, the horse-power presses it down with such force as to make a bale half the size of one coming from a Petaluma press and weighing about 350 pounds. Wire is used to bale with, to make bales of that weight, but rope can be used when the bales are not pressed so tight.

Sonoma.

PLANTING OLIVES.—Santa Rosa Democrat, Sept. 3: Luther Burbank, the nurseryman, states that the trade in olive trees is rapidly increasing. Large areas of valuable land are being set out in young olive plants every season. The Pichaline variety is the favorite, and does better than the Mission. A number of new orchards are being set out in the vicinity of Forestville, where success has attended the experiments made in the cultivation of the fruit on a limited scale. One order has been received for 43,000 trees. An order for 6000 trees, from Adolph Flamant, has already been filled.

HOP CROP.—According to the latest reports from the hop districts, west of this city, the prophecies concerning the probable heavy yield and extra quality of the crop this season are likely to be verified. The growers are meeting with great difficulty in securing hands sufficient to harvest the crop properly. The Chinese are taking advantage of the condition of affairs and demanding higher wages. In a number of cases growers have been compelled to submit, and employ their Chinese hop-pickers by the day, at \$1.25. Were the crop ripening evenly, with the present scarcity of labor, heavy loss would be entailed. But fortunately the crop has not matured uniformly, and it is thought the loss will be slight. Those who were not well conditioned to wait for the market have contracted their crops at prices varying from 17 to 24 cents.

Tulare.

NECTARINES SEVEN WEEKS.—Visalia Times, Sept. 1: On the 11th of July I. H. Thomas commenced the shipment of the Lord Napier nectarine, and this week he picked the same kind of fruit in his orchard that would stand a shipment to distant parts. No other fruit has ever been known to continue on the market for such a length of time, about 50 days.

FINISHED THRASHING.—E. H. Perkins' thrashing machine completed its work for the season last Saturday. It was in operation for 58 days in the neighborhood of Stokes valley and Sand Creek, and during that time thrashed 59,520 sacks of grain. The largest number of sacks thrashed in one day was 1750. Frank Duran, the engineer, reports the grain thrashed as being of an excellent quality, very little shrunken wheat being found during the season.

Three District Fairs.

The fairs for the Fourth, Eighth and Thirtieth Agricultural Districts were held last week at Petaluma, Placerville and Marysville, respectively, and all, according to reports received, with great and gratifying measures of success.

Petaluma.

The Fourth District, as now constituted, includes only Marin and Sonoma counties, but no sooner had the date of this year's fair been fixed upon than applications for space in the pavilion came piling in upon Superintendent Byce until the demand far exceeded the room available. So the directors tried to get a large tent wherein the bulkier implements could be shown, and succeeded in furnishing half as much more space outside the building.

In the live-stock department, also, every stall was taken, a great number recently added having been engaged some time in advance, and the entries were not only numerous but of high quality. At the stock parade on Thursday, the line of choice animals reached over a mile, much to the satisfaction of older residents, and the amazement of newcomers and Eastern visitors. Prominent in the procession were a score of beautiful Holsteins, six bulls and 14 cows, belonging to J. H. White, of Lakeville. Seth Cook's polled Aberdeen Angus herd was again admired. Four Ayrshire bulls and half a dozen cows were shown by Geo. Bement of Redwood City. Nearly 30 fine Shorthorns came from the Rancho Cotate, of which Wilfred Page is manager. M. D. Hopkins exhibited Durhams for milking strains. I. R. Jewell also had a few Durhams. Jerseys were exhibited from the estate of W. D. Bliss and by Roy Bros.

But those who know anything of Petaluma would expect the equine display to outshine all the rest of the procession, as it appears it did. Besides the racing stock, there were the massive draft horses—Normans, black and dapple gray, and gray and bay Clydesdales—and fine roadsters and matched teams abounded. A Rural representative had his attention called to a three-year-old stallion, full brother to John

Fritsch's Nellie R., and her very counterpart in shape and size. It was remarked that the number of people viewing this parade was much greater than that which attended the races the day before.

The exhibit of sheep and swine was smaller than last year's, but comprised some very fine specimens.

The poultry display was excellent. Within the pavilion, beneath adornments of red, white and blue, and guiding banners hung at proper points, was a dense collection of the products of farm, orchard and factory.

The special exhibit of the Sonoma Pomona Grange, renewed from time to time as to its perishable portions, has come to be regarded as a standing yet progressive representative of the resources of the county. A new feature in it this year is a series of photographs, designed to give a notion of the country whence comes the output. There are cornfields, melon-patches, vineyards, orchards, canneries, and so forth.

A splendid showing of shrubs, plants, and cut-flowers was made by W. A. T. Stratton.

F. F. Ennis, who has a farm of five acres under high cultivation near Petaluma, made a display noteworthy on account of the diversity as well as the excellence of products shown. The table was laden with samples of 12 kinds of plums and prunes, several varieties of apples and pears, grapes, preserved cherries, nuts, etc. The little farm yielded a net profit last year of about \$700.

W. H. Pepper, the well-known nurseryman, made a citrus exhibit that must have surprised any visitors who did not already believe in a northern citrus belt. There were several large seedling oranges, "Climax," picked last March, besides plates of other oranges and lemons. Oranges and lemons were also included in the displays of the Pomona Grange, and of Morris Bros., of Sonoma.

Excellent olive oil and pickled olives were shown by Geo. F. Hooper of "Sobre Vista," Sonoma, whose success in this line has been repeatedly noticed in our columns this season.

The Santa Rosa Canning Company and the Petaluma Fruit Packing Company made elegant displays of preserved fruits, and admirable samples of sun-dried fruits were shown by a number of persons.

It is impossible for us to print anything like a complete list of the entries, but a few, taken as they come in the middle of a local report, will serve to show the varied and comprehensive nature of the pavilion output:

R. Crane, one sack Australian wheat, one sack barley, one sack shelled corn, one sheaf Australian wheat. D. Dickson, Mangel Wurzel. E. S. Charles, lot watermelons, muskmelons, cantaloupes, rutabagas, sheaf oats, corn on ear. C. S. Gibson, one sheaf barley, sugar-beets, Mangel Wurzel, six blood beets, one sheaf corn on stalk, watermelons, muskmelons, cantaloupes—display of products raised on one farm. C. Wightman, apples, quinces, English walnuts, almonds. Isaac Parker, collection fruits raised in one orchard, collection pears, six varieties apples. Rollin Andrews, collection pears, single variety pears, six varieties pears (five each). Mrs. J. C. Diamond, lot canned fruit, preserves, jellies. C. Wightman, kiln-dried fruits, apples, peaches, plums, raisins. Mrs. A. H. Patty, catsup, pickles, jellies. Mrs. N. K. French, jellies, pickles, preserves, canned fruits. E. P. Nisson, two cheeses. R. Crane, three hams, three sides bacon. D. Dickson, 10 rolls butter.

The De Laval cream separator in G. G. Wickson's exhibit of dairy machinery, drew about it a throng of observers.

Byce's 600-egg incubator and W. H. Worth's wine press, grape stemmer and ensilage cutter attracted much attention.

J. Cavanagh exhibited a redwood board 3x69 inches, 14 feet in length.

The vehicles made by Zartman & Co., the goods from Torr & Newburgh's woolen mills, and the stocking machine at its work, the display of saddlery and harness, the needle-work, the bread and cakes made by the young folks, and the paintings in the art gallery were all more or less noteworthy and creditable.

A valuable collection of curios from Japan, China and the East Indies, loaned by Eli F. Shepard of Glen Ellen, who resided a long time in the East, proved very interesting to many.

An eloquent address was delivered Thursday forenoon, by Rev. Arthur Crosby of San Rafael to a crowd of attentive listeners.

In the baby show the four-months-old son of J. Bloom of Chileno valley was awarded the premium.

The numbers of people who attended were, from the very outset, beyond all precedent; the receipts, and the complacency of the promoters and directors were naturally in proportion, and Saturday evening brought the close of "the most successful week's exhibition ever given by the Sonoma and Marin District Agricultural Association."

Placerville.

The Eighth District Fair, held at Placerville from Tuesday to Friday inclusive, had been carefully prepared for by the directory, and proved the most successful that has ever taken place in El Dorado county. The attendance was large at both the track and the pavilion. Although the most attractive fruits of the district had been shipped before the exhibition came off, many of the strangers present declared that the horticultural display was the finest they had ever witnessed anywhere. We find it impracticable to give a lengthy report, but intend to publish the list of awards in a future issue. One of the notable events was the address by Col. John P. Irish, which is spoken of as able, earnest and enthusiastic.

The Fair at Marysville.

[Written for the Rural Press by T. S. P.]

The fourth annual fair of the Thirtieth Agricultural District commenced at Marysville Aug. 30th, and continued five days. The exhibits at the park were highly interesting and included some very handsome and valuable specimens of live-stock. The track, which is considered one of the best in the State, was in excellent condition and the races during the week were highly satisfactory both to the management and to the visitors in attendance.

The Books at the Pavilion

Showed a very long list of entries, which abundantly testified to the skill, energy and industry of the people of the district during the year just past. The articles entered are too numerous to give in detail, so we must content ourselves with a general review and a mentioning of a few only of the more important exhibits.

There were something over 400 separate entries in the department of grains, fruits and vegetables, enumerating almost everything imaginable in the way of vegetable products. The fruit display was particularly fine, and almost every valuable variety of wheat was represented. Among those receiving the larger premiums may be mentioned T. B. Hull, A. F. Abbot, A. C. Gray, G. W. Hutchins, J. P. Oustott, R. C. Kells, Hugh Jones, W. M. Jeffers, Mrs. R. Keck, Mrs. M. Karr, Mrs. Jas. Taylor and George Thompson.

In the art, dry goods and fancy goods departments, the display was both grand and pleasing. The variety of articles, perhaps, exceeded that of any previous year, and the industry was only equaled by the skill displayed. In this department, the chief premium winners were Mrs. J. R. Garrett, Miss M. C. Fuller, Miss Linda Aulman, Mrs. R. A. Dupee, Mrs. L. C. Serrett, Mrs. Frank Parks.

Among other prize-winners were White, Cooley & Cutts, hardware; Peter Engel, jewelry; V. L. Earnshields, harness and saddles; P. W. Griffiths, photographs and views; Frost & Shaffer, furniture; Marysville Appeal, printing, and S. H. Bradley, wagons.

For St. Louis.

A large collection of the agricultural products exhibited will be shipped to St. Louis this week, to be placed on exhibition during the Grand Army Encampment. W. G. Murphy of Marysville will accompany the exhibit, and be manager for Sutter and Yuba counties. He goes under the auspices of the Immigration Bureau, and it is believed the trip will be productive of much good in behalf of the northern section of the State.

The following premiums were awarded Saturday:

Horses.

THOROUGHBRED.—J. B. Ramsey's stallion Monicas, \$25; and mare, Lady Cleveland, \$20.

GRADED.—Stallions—J. B. Ramsey's Gus Payne, \$20, and Alcantara, \$15; P. McCune's Alhambra, \$10; John Lopez's Dick, \$5; A. C. Gray's Ben Sterling, \$15. Mares—F. E. Griffith's Mayo, \$5.

HORSES OF ALL WORK.—Stallions—J. B. Ramsey's Wake-up-Jake, \$15; Ira Wood's Morgan, \$7.50. Mares—A. C. Gray's Bessie, \$5; S. E. Inlow's Nell, \$10.

DRAFT ANIMALS.—Stallions—John Seaward's Boneville, \$10, and Luneville, \$15; S. Grant's Young Normandy, \$7.50; N. D. Coombs' William R., \$5. Mares—J. Seaward's Magnolia, \$10, and Maggie, \$15; C. Matthews' Nell, \$10.

ROADSTERS.—Stallions—Wm. Doty's Billy, \$10; J. B. Ramsey's Alcantara, \$15; W. Gardner's Alpha, \$7.50. Mares—W. Gardner's Nadia, \$5; F. Grant's Knighthood, \$10.

CARRIAGE HORSES.—N. V. Nelson's black team, Frank and Billy, \$10.

SADDLE HORSES.—C. Glidden's brown gelding, \$5; S. E. Inlow's bay geldings, \$2.50.

COLTS.—B. B. Boulware's sucking horse colt, \$5; Ira Wood's yearling, Flora, \$8, and sucking mare colt, \$4; Geo. Ohleyer's yearling horse, Muldoon (special), \$2.50; J. Seaward's yearling, Earnest, \$5; John Seaward's yearling, Lothair, \$2.50; J. J. McGrath's sucking mare colt, \$5; S. E. Inlow's sucking colt, \$2.50; J. B. Ramsey's sucking horse colt, \$5; N. D. Coombs' yearling, Lucy, \$4; Frank Grant's Zinfandel (special), \$2.50; Robert Davis' horse colt, George, \$5.

SWEETSTAKES.—J. R. Ramsey's stallion, Alcantara, \$25; C. Matthews' mare, Young Nell, \$15.

Jacks and Mules.

JACKS.—E. H. Gould's Romeo, \$7.50, and Romeo, Jr., \$2.50. Jennets—E. H. Gould's Rose, \$5.

MULES.—Fred. Ohleyer's Gyp, \$5; J. B. Ramsey's span of draft mules, \$10.

Cattle.

JERSEY.—Bulls—V. C. Putman's Arthur, \$15; Dexter, \$8. Cows—C. Matthews' Rose, \$12.

HOLSTEIN.—R. C. Kells took all premiums.

GRADED.—Bulls—John Kimball's black bull, \$10; L. Coombs' calf, Tifty Rogue, Jr., \$3. Cows—R. C. Kells' calf, Phoebe, \$3.50.

POLLED ANGUS.—Bulls—J. Kimball's King William, \$8; calf, Sutter Boy, \$3. Cows—Marysville Live Stock Co.'s Bergamont, \$12; J. Kimball's calf, Rosa, \$3.

Swine.

BERKSHIRE.—James Farrell, best brood sow, \$5; best sow between 6 months and 1-year-old, \$4; C. Matthews, best boar under two years, \$4; best pigs under 6 months, \$3.

POLAND CHINAS.—R. C. Kell's Prince, boar, under 2 yrs, \$4; brood sow, Beauty, \$5.

Our Heroes of To-day.

Delivered by the Author at the Opening Exercises of the Exhibition of the Mechanics' Fair, San Francisco, at Grand Opera House Sept. 1, 1887.

I.
With high face held to her ultimate star,
With swift feet set to her mountains of gold,
This new-built world, where the wonders are,
She has built new ways from the ways of old.

II.
Her builders of worlds are workers with hands;
Her true world-builders are builders of these,
The engines, the plows; writing poems in sands
Of gold in our golden Hesperides.

III.
reckon these builders as gods among men;
I count them creators, creators who knew
The thrill of dominion, of conquest, as when
God set His stars spinning their spaces of blue.

IV.
A song for these soldiers of peace; and again
A song for the marvels these men have wrought;
Our gleamy snows, and their bredes of grain
If unrolled as a scroll could record them not.

V.
A song for the groove, and a song for the wheel,
And a roaring song for the rumbling car;
But away with the pomp of the soldier's steel,
And away forever with the trade of war.

VI.
The hero of Time is the hero of thought;
The hero who loves is the hero of peace;
And braver his battles than ever were fought,
From Shiloh back to the battles of Greece.

VII.
The hero of heroes is the engineer;
The hero of might and of gnome-built deep,
Whose only fear is the brave man's fear
That some one waiting at home might weep.

VIII.
The hero we love in this land to-day
Is the hero who lightens some fellow-man's load—
Who makes of the mountain some pleasant highway;
Who makes of the desert some blossom-sown road.

IX.
The Stanfords, the Sutros and the Hallidies,
And an hundred more with their names untold—
They are kinglier far in their uncrowned ways
Than ever were kings with their crowns of gold.

X.
Then huzzah! for the land of the golden downs,
For the fruitful land of the silver horn;
Her heroes have built her a thousand towns,
But never destroyed her one blade of corn.

—Joquin Miller.

Oakland, Cal., Aug. 30, 1887.

Talks to Mothers.

The Influence of Dress on Children.

Original. By FRANCES M. PAYSON.)

NUMBER I.

There is nothing like the sense of being well dressed to put a woman at ease. Given the consciousness of faultless attire, and all the staring and whispered conversation fail to move her serenity. If people stare she knows it is to admire; if they carry on a whispered conversation, so pointed as to be directly aimed at her, she rests placid in the belief that they are discussing the relative cost of this or that, or reckoning on the possibility of copying the style. If her boots are daintily new and well fitted, she is undisturbed by the fact; nay, rather pleased that they will show beneath her dress. If her eight or ten-button gloves are perfect, she rests supremely indifferent, her hands folded in her lap, conscious that everything is right as regards them.

It is when she has on last year's suit, made over at home, that she fidgets under supercilious glances, vaguely wondering if the over-dress hangs right, or if the loopings are out behind, and arranges herself as she passes store windows with an uneasy punch here and a pull there.

It is when her well-worn shoes are giving out at the sides that she pulls them back as far as possible to hide their age. It is when her gloves are worn threadbare that she holds her satchel or handkerchief awkwardly in front of her to hide her finger tips, and in place of easy repose feels awkwardly uncomfortable, wondering if those elegantly dressed ladies opposite are staring at that hole at the end of the thumb.

How often do we hear women say: "Well, I enjoy going if I can go well dressed, but

I'd rather stay at home than go looking shabby," which means that every woman knows and feels the ease good clothes give one, and realize their benefit.

Knowing and feeling this influence in yourselves, does it ever occur to you that your children—even the wee little ones—feel the same?

Mothers are too apt to dress their children neatly, if they do so, to gratify their own vanity, or because they are naturally neat themselves and like to see their children so. They dress them for their own company with the greatest care, but they are very apt to say: "Oh, that's plenty good enough for school," when the little ones object to some garment they particularly dislike, sending them off after a time of pouting without a thought that they are forcing the children to undergo a real trial. No mother will willfully hurt her child's feelings, yet very many in these small ways, these petty little tyrannies, which are so easily exercised by the older ones, hurt them some times to the extent of souring their disposition for life.

It is hard for older folks to realize how very real and heart-breaking these little trials are, or how things which seem so trivial to them can be of such moment to little ones.

When the little ones beg to be allowed to wear their best hat, "just for to-day, mamma," or cry for an apron they particu-

larly admire, stop and think whether it is possible to gratify them, or, if not, whether you can't give them something to take its place.

I tell you this child-world is nothing but society on a small scale. If you don't believe it, just put on your hat and coat some day and pay a short visit to the school your children attend. Go at recess, when all the scholars are out, and see how these miniature men and women stare at you, critically observing every item of your attire from your boots up.

Observe how Nellie B— looks keenly at your hat, just as Nellie B—'s mother examines it at church, till you feel an un-Christian desire to take it off and say: "There, now, just take it and look at it!" Notice how little Mamie W— is "taking in" the style of your drapery exactly as your mother does when she meets you on the street; see how little knots of children stand off and discuss your relative merits pro and con quite as rudely as their elders.

You don't care a bit for their little criticisms, of course not—they are but children; but just think how it would feel if you were one of them, and they comprised your little world as they do that of your boys and girls.

You will find, if you keep your ears open, that this boy has the name of "rag-tag," because his mother, being very busy, didn't take the time to mend the hole in his pants, and another goes by the pleasant epithet of "hatzy," because his mother thought his old torn hat was "plenty good enough to throw around the schoolyard."

That sort of thing wasn't a bit pleasant to have to bear, day after day, and these petty little insults are just as hard for little ones to bear from childish snobs as are those we take from grown-up ones.

Any child feels the influence of neat and tidy dress, and a self-respect arising from it which nothing else can give, and which, believe me, does a great deal toward keeping

them out of bad company. A fresh collar and tie and boots neatly blacked will do more than all the lecturing in the world to make them start the day with a happy face.

I remember one wise mother, who, having a large family of children, saw and realized this fact perfectly. Said she: "There come days sometimes when it seems as though the children are all out of sorts; they get tired of all their games and fret and quarrel till it is almost distracting. It's no use to whip or scold, and when they get to feeling like that, and everything else fails, I just make every one of 'em change their old clothes and put on the very best they have. I don't know why it is," she said, "unless it is because they feel a sort of self-respect when they are neat and nicely dressed; at any rate, 'tis the best cure I know of."

How often I have tried it with my own little ones, till I have become convinced that children are very susceptible to the influence of dress."

I know another mother who, being ambitious for her children, was much worried by her older boy's heedlessness, and the fact that he seemed to have lost all ambition at school. She went to work to study the cause. She had always kept him clean and neat—as neat as other children who went to the same country school, but she made up her mind that for him that was not enough—his pride needed rousing. He could keep up in his studies if he only tried, but he had

FANCY WORK-BAG.

accepted a low place and didn't seem to care to get higher. After a good deal of thinking she came to the conclusion that if his pride was not roused while he was young it never would be, and that his clothes were the only means of reaching it; so the first thing she did (he was ten years old and large for his age) was to put him into long pants, making them not baggy and straight, but neat and tight-fitting and belted at the bottom in the conventional style—a style which caused the other boys to enviously dub them the "dude pants" instantaneously. However, the pants did what all the coaxing or driving never could have done; they gave him ambition. The boys called him a "dude," but they envied him—envied him to the extent of covertly admitting it (what boy ever was proof against a genuine pair of bell-bottomed pants?) and the happy owner became the observed of all observers, the hero of the hour.

No boy with such manly attire, regarded as a hero, could long play the part of a lazy dunce, and the sly little mother smiled in her sleeve when she saw her big, rough, heedless boy come marching soberly home from school, his head carried high, as if to say, "I never missed a lesson to-day, and the boys all thought my pants was dandy."

As a consequence of pants (that little mother firmly believes it was nothing else) her boy stands at the head of his classes, proudly showing his monthly record away up at 90 and 100, the best boy in school, because ill manners and good clothes don't go easily together; the neatest, because clean collars, neat ties, smooth hair and neat finger-nails are the natural adjuncts of the balance of his costume.

Take a ride any time on the street car and notice children there. You may see little tots of three and four years eyeing one another shyly, the well-dressed one confident, the ill-dressed one diffident and awkward. The little miss, blest with frills and furbelows, lolls back with an exasper-

atingly fine ladylike air, placidly conscious of the admiring glances from Bridget O'Rourke's baby across the way. Bridget O'Rourke, Junior, has rough shoes with the shoe-strings hanging, coarse stockings wrinkled carelessly over the knees, a common dress and rough hat. Miss Baby feels this. She eyes her supercilious neighbor, scans the dainty stockings and boots, glances at her own rough ones, and pulls down her dress; that is the first sign of discomfort. Presently she notices the pretty pink-ringed hand of baby number one, and if you watch, you will see a glance of comparison at her own. Discomfort number two; she doubles up her dirty little fists under her apron. She keeps up her comparison, however—she can't help it, aided by conscious glances from little Miss Fashionable opposite, and having edged around, blushes a red baby blush, and finds her hands and feet, of a sudden, most uncomfortable appendages; she finally shrinks back behind her mother and sulks bashfully with her finger in her mouth.

Oh yes! human nature is the same the world over, and dress has its influence on manners and character, and always has had since Eve hunted all over the tree for a prettily shaped fig-leaf.

Little Bits of Natural History.

(Original—by ALLAN KARR CUSTIN.)

Natural history is such a beautiful study, but then it is so long and there are so many hard names, and life is so short, and there are so many other beautiful studies that natural history is apt to be rather neglected.

"How can a frog breathe under water?" my boy asked me the other day. "Why, you can drown a frog as well as a fish," I replied, "if you keep them long enough under water." But my boy demurred to this. So, thinking it easy to prove, I began to hunt for my authorities. But alas! after searching several large and celebrated works, I could not find a satisfactory answer; but oh! the beautiful world the search opened to the uninitiated! I had seen glimpses of this world before, both in books and nature, but in this study there is always something new, something interesting.

"Now I will begin at the beginning," I thought, and lo! and behold! the beautiful coral was presented as the number one in animal life, the beautiful coral that my wife wears on her breast, fashioned in the form of a lovely woman's head; and the poor man whose researches revealed the fact that the coral was an animal and not a plant, died in high dudgeon in the Antilles, a short time after his triumph was declared. He had retired there when the savants would not accept his theory. Coral branches several feet high are to be seen in the shell and curio and in most of the bird stores; also many other things that will help the student of natural history.

One of the lowest numbers in the ascending scale of animal life is the jelly-fish, that mass of transparency that when found lying on the beach the boys like to poke with a stick, but when this mass is swimming it is sometimes very beautiful, like a silver ribbon flashing through the water; then again, gliding slowly, silently, like a ghost, so that it is sometimes called the specter of the deep. The jelly-fish is quite an article of commerce on the Pacific Coast, being dried and sent to China in large quantities; there it is highly esteemed as a renewer of youth?

Who would imagine that the celebrated white chalk cliffs of "Merrie England" were mostly composed of little shells, so small that it requires a powerful microscope to see distinctly their elegant forms.

The ridge runs across the channel and partly over France. The sands of the beautiful bathing beaches, many high mountains, vast beds of limestone rock in Russia (formed by one species alone. There are six families, 60 genera, 16,000 species; grandmothers, daughters and grandchildren as it were) are all mostly composed of these little microscopic shellfish. And to think of Paris, beautiful, wonderful Paris, being built of the remains of these little things.

A patient scholar, M. d'Orbigny by name, discovered in a little bit of Paris chalk scarcely a cubit in size, the remains of 58,000 of these small creatures. The Pyramids are greatly composed of the giants of the species, the sea sands of the dwarfs.

What millions of years it must have taken to form such vast parts of the globe of these little—well, I hate to give you their name, it is so long and hard, unless you hear it pronounced; well, the scientific name Foraminifera, meaning full of holes, and out of these little holes they push tiny, transparent arms and fasten on to their prey, and hold it for

*After writing the above I found a similar illustration in a celebrated work in regard to Infusoria.

good and eat away to their heart's content. They can climb up the inside of a glass vase by putting out at will a little foot, like a man with spikes in his shoes climbing a telegraph pole; they are little villains, too, having no mercy on their prey, and paralyzing the poor little infusoria that happen to pass their way by throwing out a species of electricity. Some of the families or genera are now extinct, but enough remain to continue the wonderful part they have played in the formation of the world, for they are found all over the globe, and mountains, hills, valleys, caves, palaces, the Pyramids, are all in a great part composed of the tiny foraminifera. Remember their name because of these wonderful facts, and remember, also, the lesson it should teach of the value of little things, deeds, words, acts, for it is by the accumulation of these that such immense results—called history—are formed.

Bric-a-Brac.

THE Christian name of all beggars in Mexico is "pordioseras," "for God-sakes." As a translation of our word "tramp," it is rather poetic.—*Pittsburg Chronicle*.

THERE is a cute Yankee in an Illinois town who plants a sunflower seed in every hill of beans. The stalk serves for a bean pole, while the seed is utilized for chicken feed.

THE Rev. J. L. Jenkins, the well-known Congregational minister of Pittsfield, Mass., says there are "in Massachusetts alone 330 needless churches wasting the Lord's money." He thinks that Christian unity would end this waste.

REV. MR. LOWY, in a recent lecture in England, quoted a clause in a Jewish marriage contract, from the middle ages, in which the father of the bride besides promising to maintain the young couple for a year, also promised to have the bridegroom instructed in Hebrew for the same period. Fancy such a clause in a marriage contract of our day.—*Jewish Messenger*.

A DAKOTA horse was picked up by a little afternoon zephyr out there the other day, carried half a mile and left in an unrecognizable mass by the side of a ravine, and on the headstone which her kind master reared he inscribed these words:

This old family steed
Now no more we shall feed—
In life there could nothing go faster—
She was born at Hoboken,
And died all wind broken
By a breeze that couldn't get past her.
—*Duluth Paraphraser*.

Chaff.

ARTICLES of wide-spread popularity—Umbrellas.

SHOW the waste and drift of winter—The back garden.

WHY a man boots his dog and merely shoos his hen has never been precisely determined.

IT is true that doctors disagree, but they don't disagree half so much as their medicines do.

WHEN Gladstone is among the trees of his Hawarden farm they say he is a first-rate feller.

"I CONSIDER him a bold, arrogant man."
"Yes, I know he is, but he won't be very long." "And why not, I should like to know?"
"He is to be married next week."

BETWEEN dear friends: "Do you know that little Mrs. B. pretends to be a collector of antiquities? You don't believe she has any do you?" "Oh, yes—her certificate of birth to begin with."—*Judge*.

"HERE'S a hair on your shoulder," said his wife with ominous calmness.

"Oh—er—yes; I've been playing with the poodle."

"John, don't be silly. Flossie is not a brunette poodle."—*Washington Critic*.

Fancy Work-Bag.

The foundation of this bag is a small, round basket. Around the top is gathered the lower edge of the bag portion, which is composed of rows of fancy and plain ribbon. Each row of ribbon is of a different variety or shade, and some of the rows are gathered slightly along the side edges so as to produce an odd effect as possible. The top of each row is shaped in a point, and the bag is drawn in as closely as desired by a shirring some distance below the top, the points looking like tulip petals above the shirring. A wrinkled ribbon covers the shirring, and a large bow of ribbon is fastened where its ends meet. The top of the basket is decorated with ostrich tips alternating with groups of ripe-looking fruit. Flowers, leaves, moss, etc., may take the place of the tips and fruit. If the ribbons are neatly joined with over-and-over stitches the bag need not be lined.

YOUNG FOLKS' COLUMN.

Youthful Pleasures.

(Original—by M. B. D.)

Ever so long ago the grown-up young ladies of to-day were little girls and loved to swing and play with dolls so much that they would even blush now to think of it. And so one summer day of this time long ago, four or five of these little girls went to see another little miss who lived in a great, handsome white house set among groves of trees and a garden of lovely flowers. This little girl's papa had made a swing for her in a great old tree in one corner of the garden where she could go to amuse herself when she was alone. But she was always told not to swing high for fear the chains of which the swing was made might break, or she might fall; and Madge, who was usually very obedient and careful, always did just as she was told.

However, this day of summer in the by-gone years, Madge's playmates found her in one of the merriest moods, and dressed like a little fairy for their day's fun in a snowy lace-trimmed frock, with pink ribbons on her glossy brown curls and the daintiest pair of bronze slippers that could be imagined. The children spent a very happy afternoon, and as evening drew near they gathered in that out-of-the-way part of the garden where the old swing hung creaking on its heavy chains and looking very lonesome as it gently moved to and fro in each careless breeze that came sweeping by. They were in hilarious spirits with the prospect of the swing, and besides, the soft air heavy with the scent of primrose and honeysuckle in the garden, the reddening sunlight bursting through the openings in the trees, the crickets stirring up a shrill and quiet chirp in the grasses, and the dreamy sense of the purpling twilight coming, warned them that soon their play must end, so they made their final hour as joyous as possible. Last of all came little Madge's turn to swing, and she was so delighted that she bade all her friends swing her high up into the branches that bent downward, forgetful of her papa's commands. But alas, her wild joys were soon ended. Higher and higher she swung, each time as she neared the drooping boughs, trying to touch a twig or leaf with the toe of her little slipper, and at length succeeding so well that she could put her whole foot into a cool mass of soft green leaves; but as is usual when little girls are disobedient, something very unpleasant happened, for lo, when she thrust her foot into the leaves for the last time as she thought, something caught it, and then she was whirling about in the air, and the chains were clinking loudly and the children making little screams below, and the last of it all was that when the swing came down again she was desperately clinging to one chain that pinched her hands, her foot felt as if something had twisted and scratched it and her slipper was gone.

Madge was very tender-hearted, and this punishment came so suddenly and so swiftly that she broke down and cried bitterly and her day of pleasure ended very seriously. After she had said good-by to her little friends from her perch of snowy pillows piled up in a great arm-chair, her papa talked for a long time with her about her foolish conduct in forgetting his warning not to swing too high. "See," he said, taking a little slipper out of his pocket, "I found this tightly wedged in between two boughs where your foot was caught, and this was all that saved you from a terrible fall or from a broken limb; for if you had worn shoes to-day instead of slippers, your foot would not have got free at all from those branches that were grinding together with the straining motion of the swing, and I would have had no bright little daughter to sit here with me now and watch the sunset; besides, this was wholly an unforeseen peril. I never thought of such a one as this, for other very awful and disastrous accidents were far more likely to happen."

As I said before, Madge is now a grown-up young lady and often thinks of the happy days of her childhood; and she remembers with fullest joy that her accident in the swing taught her a very useful lesson which she has never forgotten, and even yet observes its teachings though she has to sacrifice herself very often to do it. Her old swing still hangs under the green tree in the quiet corner of the garden, associated with many merry hours, and she has the satisfaction to know it taught her early one of the hardest, yet most useful lessons—the lesson of obedience.

GOOD HEALTH.

Facts About Malaria.

The exact cause of malarial fever, writes a correspondent to the *Providence Journal*, may safely be left as an open question for discussion by scientists; however, there are those who think that they do know the cause, and have demonstrated to the satisfaction of others that they can produce the material which originates such fevers, and also by its use induce the disease in the human system. The following information in regard to the causes of malaria and the means of avoiding it is well worth a careful perusal.

It is known that malarial districts have existed in the New England States, to a limited extent, for a number of years; but there is a possibility that during the war of the rebellion the seeds of this disease were brought North by returning soldiers. Perhaps in the great outbreak of malaria in 1881, when streams and ponds were lower than for 50 years, there was then uncovered to the sun, and to propagation, germs of this disease, which already existed in such places, or a suitable place was then provided for them to develop from other sources.

In all old fever-stricken countries the inhabitants have learned by long experience what must be done to avoid malarial attacks, and they have formed habits which have become almost intuitive. In Rome, and generally in Italy, the Italians avoid walking in the sun; they have a saying which runs thus: "Only Englishmen and dogs walk in the sun." A difference of from 30 to 50 degrees occurs in the middle of the day between sun and shade. Also, all Italians enter the house just at sunset, coming out later. Going out at an early hour in the morning before eating or continuing from an early breakfast until a late dinner without a lunch, is condemned when there is any possible exposure. In Rome, Americans are much more subject to fever than the English, as the former trust to their habit of an ample breakfast to carry them through to a 6 o'clock dinner, whereas an English-born man or woman will have his or her lunch at mid-day. The fever germs taken into an empty stomach just at nightfall find a road open to enter into the circulation. It has been too well established to be questioned that fever germs may be taken into the stomach of a healthy person with impunity, because when proper food has been taken at regular times the digestive process will kill the germs. In Central America the natives cannot be induced to eat fruit after about 10 o'clock in the morning; up to that time the condition of the stomach is at its best for the proper digestion of fruit. Generally speaking, uncooked food is difficult of digestion, and the passage out of the stomach of a portion not digested may take through some of the malarial poison. The writer first learned this rule in Europe in 1874: "If exposed to the malaria, in no case eat either uncooked fruit or vegetables; also avoid drinking unboiled water."

Breathing wholly through the nose is of the utmost importance with respect to fever prevention. All air upon the land has more or less impurities and germ life. If the purpose of the nose, and its membranes, is not to strain and collect these poisons, then certainly the Creator might have omitted the nose and allowed us to breathe through the mouth. Taking air into the lungs partly through the mouth only tends to make the nose an unhealthy organ, a very breeding-place for disease. A very liberal use of handkerchiefs may be suggested as effectual aid to keep poisons out of the system. Parents should teach children to breathe through the nose; at night it should be seen that they are so placed that the tendency is to natural breathing, and to carefully and persistently close the lips to induce the habit of nose breathing.

A very important point with respect to fevers is the prevention of colds; this, after the consideration of good general health, is of the utmost importance. It is known that the pores act a very important part in the system in carrying off matter deleterious to health. When the pores are closed, malarial poisons accumulate in the system. The effort of nature to throw off this accumulation is the well-known ague or "shakes," followed by fever and the sweating. A return of this takes place when there is again a large accumulation of the malarial poison, making thus periodical returns. One of the surest means to prevent cold is the wearing of all wool next the body. The English Government made experiments running through a series of years, clothing soldiers and sailors in the several fabrics, cotton, linen and woolen. The result of these investigations was to clothe their soldiers and sailors in all wool the year round. All-wool underclothing protects the body from sudden chills—first, by carrying off moisture much more effectually than can be done by a vegetable fiber; second, wool fabrics, by their texture, make air spaces to act as a protecting shield. Cotton or linen, when damp from the moisture of the body, holds that moisture, which acts as a good medium to rapidly conduct away heat.

In the cure of malaria, what will operate to advantage as a medicine with some will with others have no good effect; but whatever the medicine, most carefully avoid any of the inducing causes which have been noticed.

Careful investigations made 20 years since in Ohio by Dr. Salisbury seemed to establish the

fact that the fever germ was a living organism—a self-dividing fungus, which, on entering the system, changed the blood after the manner of a poison. In 1879 Prof. Tommasi Crudeli fully confirmed the above view in an article in the *Atti della Reale Accademia dei Lincei*, at Rome. He named the germ *bacillus malarie*. Dr. Salisbury had collected the germs, and went so far in his experiments as to induce fever in individuals by exposing the germs in their sleeping-rooms.

It is believed that this germ rises on the heavy air at night, and falls again at or after sunrise.

It is known that no malarial fevers exist in the region of sulphur works.

The Abyssinians, when preparing to hunt the elephant in malarious districts, thoroughly fumigate themselves with sulphur. Sulphurous acid has been adopted by the Health Board of the General Government as the disinfectant to be used in case of an invasion by the cholera germ. In any district where malaria is localized, it would seem to be a very simple and effective way to kill the fever germs by burning sulphur just at nightfall. Sulphur is so very inexpensive that it would cost but a very few dollars to effectually try the experiment.

A few years since the writer was met with this alternative, to either tear down a house or render it tenable; 30 cents worth of roll sulphur burned in the building made it habitable.

The proposition to kill fever germs by burning sulphur in the open air may seem impracticable, but the object to be attained is certainly great enough to induce a trial under favorable conditions. The smoke of large cities and the campfires of an army are considered to act effectively in preventing malaria.

DOMESTIC ECONOMY.

WEDDING CAKE BAGS.—Pretty receptacles for wedding cake, instead of the small boxes so long in use, are now made in the form of tiny satin bags. Any delicate color of satin can be used, though white is much more to be preferred than any colors. Make the bags in the shape of miniature work-bags, just large enough to hold the cake without jamming; work or paint on one side the monogram of bride and groom. If made of white satin, lined with the same or bright gold satin, and the monogram worked in bright gold, they are especially dainty. Wrap the cake in confectioner's paper before putting into the bags.

TO PRESERVE CRAB-APPLES.—Sort your apples, and the perfect ones put by themselves, trim the stem (leaving about an inch on the apple) and scrape out the blossom end, wash them, put in a porcelain or other preserve kettle, cover with water, cook until you can run a straw through, skim out and weigh; to each pound take a pound of sugar and a cup of water, boil and skim, put in the apples and boil until clear, skim out, boil the syrup a few minutes, then pour over the apples. The water the apples were boiled in measure, and to each pint put a pound of white sugar, boil an hour, and it makes a beautiful jelly.

PICKLED PEACHES.—Four pounds of sugar, one pint of vinegar, to 12 pounds of fruit. Put sugar and vinegar together and boil, then add the fruit and let it come to a boiling point. The next day drain off the liquor and boil again. Do this three times and your pickles are delicious. Add cinnamon to the liquor and stick two or three cloves in each peach. Do not pare, but rub the fruit carefully with a flannel cloth, and put up in cans the same as any fruit, though they will keep a long time in jars.

SPICED GRAPES.—Seven pounds of grapes, three pounds of sugar, brown or white, one pint of good vinegar, two teaspoonfuls of ground cinnamon, one teaspoonful of ground allspice, one-half teaspoonful of ground cloves. Stem the grapes, weigh them, pulp them, at the same time taking out the seeds. Put the juice of grapes, sugar and vinegar into a preserving kettle. Let boil and skim, add spices, then grapes, skins and pulp. Let all get boiling hot, then remove from stove and can.

WATERMELON PRESERVES.—Cut and prepare the rind, boil very hard thirty or forty minutes in alum water quite strong, take out and put in clear, cold water, and allow them to stand over night; in the morning change the water, and put them to boil; let them cook until they have changed color and are quite soft. Then make a syrup, allowing one and one-half pounds of white sugar to a pound of fruit, then add fruit, which needs but little more cooking. Mace, ginger or lemon flavors nicely.

APPLE JELLY.—Take half a peck of juicy, tart apples, quarter and core, but do not pare them; put into a kettle with two lemons cut up with them, and cover well with water. Let them cook until reduced to a pulp, when strain through a flannel bag. To every tumbler of juice, add two-thirds of a tumbler of white sugar. Boil hard for 20 minutes; put in glasses and cover next day, using brandied paper next the jelly, and covering the glasses with paper wet with flour paste.

PRESERVED LEMON PEEL.—Make a thick syrup of white sugar; chop the lemon peel fine, and boil it in the syrup 10 minutes. Put in glass tumblers and paste paper over. A teaspoonful of this makes a loaf of cake or dish of sauce very nice.

The Week.

Quite a general rain has fallen over the north-
ern half of the State. The downfall ranged
from a sprinkle up to three-fourths of an inch,
according to locality. The meteorologists tell
us this is not a winter rain, as it came from the
south instead of the north; but it was quite as
wet, as people who had grapes exposed and
dried fruit under dripping trays were not slow
to discover. It does not appear, however, that
much harm was done on the whole, although
some suffered. Thrashing was about over and
the crews disbanding, but some grain was left
too long in the fields, and may get stained. It

is not expected that more rain will follow im-
mediately, but it will be well for all to get their
goods under cover without further delay.

The rain, viewed from the tourist's standpoint,
will be highly prized. The dust will be some-
what moderated, if not quelled. The foliage is
bright and clear and the atmosphere delightful.
This will be a boon to the fair-goers.

A new thing in the fair line is being at-
tempted this week at Grass Valley. The
track and grand stand are lighted by electric
lights, and running, pacing and trotting are
to be done. It will be merciful to the horses
to have the cool air of the evening for their
supreme efforts. How the venture succeeds
we shall know next week.

The State Fair.

It is a good year for the fairs. The interest
in making California better known, which is
now actuating both individual and organized
effort, naturally finds in our great industrial
exhibitions a fine opportunity to get in effec-
tual work. The result is the unusual fullness
and excellence of the district fairs, which have
been held so far, the special attention given
this year to the Mechanic's Fair in this city,
which has crowded the main building and two
new annexes with important material, and we
expect another outcropping of the newly
awakened progressive spirit will be such a rally
of people and products at the State Fair as the
State has never seen before.

The State Fair will open at the grand pavil-
ion on the State capitol grounds in Sacramento,
and at the Agricultural park, on the eastern
edge of the city, on Monday, Sept. 12th. For two
weeks the display will be in progress, and there
is every reason to expect that in both park and
pavilion departments the exhibition will be
greater than ever held in California. Our progress
in the importation and breeding of live stock is
such that we lack no materials for showing the best
the world affords. Then there will be brought
together the finest and purest-blooded horses in
the State. Horses in whose veins courses the
fiery blood of the Arabian steeds and the high-
bred race-horse of England; horses for heavy
draft and the truck; horses for the road, car-
riage and farm; horses, in short, adapted to
every purpose for which that noble animal may
be used by man. We shall see the best breeds
of cattle in the world. The noble Durham,
Hereford, Angus and Galloway, for beef; the
beautiful Devon, suited to so many uses; the
dairy families of Durhams, the milk-giving Ayr-
shire, the cheese-making Holstein, the butter-
producing Alderney and Jersey. In the sheep-
pens we shall find some of the finest specimens
of French Merinos, Spanish Merinos, Cotswolds,
Southdowns, and all other various breeds that are
known. Swine will be shown in profusion, and
no doubt the beautiful Angora goats will win
the admiration of all. Poultry, too, in all the
excellence of the improved breeds will delight
the eye. It will give one new ideas of the ex-
cellence California has already attained to care-
fully study the exhibits made at the Park dur-
ing the State Fair.

In the pavilion there will be an unusually large
collection of county exhibits. Preparations
have been in progress for some time, and with the
aid which some of the county supervisors have
voted, it may be expected that for extent and
style many of the county displays will be notable.

The *Record-Union* says that the county ex-
hibits will be greater in number, better as ex-
positions of county products and more warmly
competitive. The many residents who con-
tribute materials will be interested to attend
the fair, and we would advise all who can to do
so. In view of the great interest in California
lands and their adaptations, and the throngs of
people who are going up and down seeking
homes and investments, it will be well for each
county to have a good talking force on hand in
the pavilion during the fair. The committee
which has charge of the material has usually
enough to do without much talking, and some
one should be present to give such accounts of
the land and its uses as only actual residents
can furnish. If the counties are to get the full
value of their displays, let them be sure and
have a good force of conscientious, intelligent
talkers on hand. "Blowers" are not desir-
able—except in the case of Yolo county, where
they really have a good one.

We anticipate much interest will pertain to
a new contest which the State Board of Agri-

culture has provided for this year's fair, in the
shape of awards for a sheaf display of cereals.
Forty sheaves, not less than 10 inches in diam-
eter, of 10 varieties of grain are called for; not
necessary that they be grown by exhibitor.
Notice was given early, and we hope many
samples were gathered during harvest and laid
away for exhibition. The idea of this award
was to make prominent our cereal products, and
it is a good one. Now that fruit is fashionable
and profitable, it is not wise to forget the
cereals which have done such stalwart service
for California and which will always figure
very largely in our agriculture. If these sheaf
collections are full, as they should be, they
will give a most excellent opportunity for valu-
able study. If this matter has been overlooked
so far, it may be possible even yet to make col-
lections by getting good specimens here and
there from different growers. Each grain
county exhibiting should have an entry in this
department.

In commenting upon this year's work of the
Board of Agriculture, the excellent annual re-
port recently issued should not be forgotten.
It is a document of great value in setting forth
the resources and agricultural achievements of
the State, and reflects much credit upon the
Secretary, Edwin F. Smith, who compiled it.
There are a number of notable contributions
in it, but perhaps the most important is the
study of California climate and meteorology by
Sergt. J. A. Barwick, the Signal Service ob-
server at Sacramento. We believe it is the
fullest collection of weather statistics ever
made in the State, and the deductions made
therefrom are so direct and intelligible that
the reader gets his fill of practical informa-
tion. If the State should issue this report in
cheap form by the hundred thousand for gen-
eral distribution, much good would result.

Mechanics' Fair.

Since our notes last week the Mechanics
Fair has made wonderful strides toward com-
pletion, and may now be said to be in first-
class shape throughout, except the last-built
annex, which will be complete by the time
this reaches the reader. As a whole, the fair
is a most gratifying success and a credit to all
who have contributed to it. Everything is
bright, new and beautiful, the whitening and
the new decorations serving as an excellent set-
ting for the unusual care and expenditure which
exhibitors have given to the preparation of
their displays this year.

The county displays are upon a scale and em-
bellished in a style not hitherto attempted.
Besides the counties enumerated in last week's
RURAL, quite a number more have appeared.
Occupying a commanding position, and first
greeting the eye of the entering visitor, is
Solano county, with a very well-selected and
arranged display. Next comes Stanislaus, also
well represented. Kern county occupies not a
large space, but for variety of material and
taste in its display, wins much praise. Contra
Costa shows fine products on two stands.
Placer county has a large space filled with
choice fruits. Nevada county, so far, has main-
ly a mineral exhibit. Sonoma county exhibit
(which is distinct from Sonoma valley exhibit
mentioned last week) occupies the greater part
of one of the new annexes, and is arranged in
fine style. Not all the material has yet come
in, but is daily expected.

In the second annex which is now being com-
pleted, Livermore has an extensive display of
products, and San Luis Obispo has part of her
vegetable collection spread in this room. Here
also is the cereal, fruit and plant exhibition of
the State University, which is arrayed in quite
a striking manner.

At some of the county exhibits some varieties
of peaches and other fruits now out of season
are shown—having been preserved by the Alle-
gretti process. The samples seem to be in
perfect condition.

These are but preliminary notes. We ex-
pect to give the agricultural features of the fair
closer attention hereafter.

DEATH OF C. M. HOVEY.—The death of
Charles Downing and Marshall P. Wilder is
followed close by the departure of others of the
old guard. C. M. Hovey, the veteran horti-
culturist, died at his home in Cambridge, Sept.
1st, aged about 77 years. Mr. Hovey was one
of the best-known American pomologists and
horticulturists. He was a native of Cambridge,

where early in life he established a nursery,
which he conducted to within a few weeks of
his death. In 1835 he founded the *Horticultur-
al Magazine*, and for 35 years was its editor.
In 1848 he began the publication of *Fruits of
America*. He has produced many beauti-
ful forms of flowers and valuable fruits, and
was especially devoted to the hybridization of
plants.

Buying Land at Booming Prices.

Truly the land furor rageth, the real estate
Dog Star blazeth, and things not predicted in
last year's almanac come to pass. But if any-
thing is to be bought at fancy prices it is land,
especially good agricultural land in California;
wherefore it may be well that people having
money to spare should so invest a portion of it,
even at the present land-selling rates. Buy-
ing land is not like buying stocks. It is not
like them, shadowy and uncertain. If prices
recede, and even go out of sight, there is always
something left—providing you pay for what
you buy. Land, as the old law phrase hath it,
"savoeth of the realty;" that is, it is fixed,
permanent, tangible. It cannot be burnt up
with fire, blown off by cyclones or washed
away by floods. Land, at least here in Califor-
nia, is not exposed to be sunk, shaken up or fis-
sured by earthquakes, nor yet to be half the
time hidden from sight by snow. The owner
of real estate naturally likes to see it more
than once a year.

As land in this country cannot be destroyed
or buried out of sight, so can it not be ab-
stracted or stolen. You do not have to lock it
up or take it in of a night. Where you leave
it on going to bed there you find it in the
morning. Excellent qualities, these, for any
property to possess. Buying good land in this
State is like laying up treasures on earth,
where moth doth not corrupt nor thieves break
through and steal. We sometimes hear people
say that it is a good thing to have a bit of
land to die on, which saying may be supplu-
mented by this other, that it is a good thing
to have a bit of land to live on. The only dis-
advantage attending proprietorship of real
estate is that it qualifies the owner to go on
bonds in criminal cases. But every bleas-
ing in this world is attended with some
drawbacks, and this which so attaches to land
ownership is not a very serious one. Then
there goes with the freehold a certain dignity
and sense of independence that more than com-
pensate for any inconvenience it may cause.
Yeomanry in former times conferred upon the
possessor not only social distinction but also
many political privileges then much coveted.
In most countries none but freeholders are al-
lowed to exercise the elective franchise, this
for a long time having been the case in some
States of the Union.

A California Affliction.

One of the most perplexing questions con-
nected with housekeeping in California is the
need of domestic help in the household. As to
the cause of the scarcity of intelligent labor in
this department, when there is an abundance
and a surplus in all the different departments of
woman's labor, and especially among girls who
work with the needle, we will not undertake to
assign the reason. If our society has been edu-
cated to think that domestic duties are vulgar
and degrading, and that the woman who knows
how to cook food properly is not the equal of
the girl who labors 16 hours a day with the
needle for a mere pittance, then we shall pro-
pose that some philanthropist shall endow an
institute for the sole purpose of teaching our
girls how to cook a meal. The burdens of the
household in city and county have become
unbearable. As an illustration of the afflic-
tion connected with housekeeping, one of our
well-known citizens procured from an intelli-
gent office, under a high recommendation, a
middle-aged woman for domestic service. The
mistress undertook the task of giving instruc-
tion, but soon found her patience exhausted
and gave up in disgust. The climax was
reached the following morning, when the
highly recommended woman was found making
desperate efforts in grinding coffee with a com-
mon grindstone used for sharpening the kitchen
knives, when there was a fine, large coffee-mill
within three feet of the grindstone.

SAN DIEGO exhibit at St. Louis will contain
a 600-pound turtle.

CENTRAL ARIZONA.

[NUMBER 2.]

Written for the RURAL PRESS by O. C. WHEELER, LL.D.]

Meteorology and Pluviology.

The accompanying meteorological table is compiled from the records of the United States Signal Service Station at Phoenix, which is near the center of the district under consideration. It gives the extremes of thermometrical readings for an entire year, and is, therefore, regarded as a fair indication of what may be expected, subject, of course, to ordinary variations. It is, however, suggested to the reader that in a climate where so very little rain falls during the year, and where absolutely no dew ever falls, the atmosphere is necessarily so dry that when Fahrenheit reads 100 degrees in the shade there will be less unpleasant effect on the human system than will be produced by a temperature of 80 degrees in an atmosphere kept moist by frequent rains and dews. Hence if we should conclude that, because the temperature in New England or the Carolinas would be unendurable at 115 degrees F., therefore we could not live in Arizona when the thermometer indicated the same, we should be laboring under a serious misapprehension, leading to conclusions quite unfair to the latter. Long experience and careful observation by intelligent and unprejudiced residents furnish indubitable evidence that the climate of Arizona is certainly quite as healthful as that of any State in the great interior of the nation or on the Atlantic seaboard.

Dec. 1, 1882, to Dec. 1, 1883, from records of the United States Signal Service Station at Phoenix, Arizona.

—No report. †Fifteen days no report. ‡Last 16 days no report.

SUMMARY.
Days, clear, 139; fair, 129; cloudy, 15; rainy 11; no report, 71. Wind, days, S., 67; W., 46; E., 9; variable, 7; calm, 52; no report, 124. Though the last six months of this table is deficient in its record of rains and winds, as a whole it is sufficient to give a fair idea of the character of the weather.

The rainfall in this district is as singular in its character as the effects of the temperature upon the human system are surprising. Farther north, where the elevation is much greater, and where heavy snows fall, the atmosphere is moistened as the snows melt; while in the central portion of the Territory, where the elevation is scarcely 2000 feet, and where snows never fall, they must depend for their rainfall upon the humid winds that come from the Pacific and the Gulf of California, across the northwest portion of Mexico (where they lose much of their moisture), reaching Arizona from the southwest about the first of July, between which and the middle of August the principal rains of the year fall. In some years there are slight precipitations in December and January, though they are so unreliable in time and so small in quantity that they are depended upon only to a very limited extent. In fact

the entire rainfall of the year is so slight (scarcely amounting to more than five or six inches) that no dependence is placed upon it for agricultural purposes. In Salt River valley, the largest and most important agricultural district in the Territory, the strange fact exists that no dew ever falls. A practical application of this phenomenon will be referred to in another part of this treatise.

Irrigation and Cultivation.
The law of balance and compensation is, in nature, universal; but nowhere more striking-

answers Nature's call to give new force to vegetative life. Without any depreciation of the wisdom of "Him who sendeth rain upon the just and the unjust," it is a fact so universally admitted as to call for no argument, that there are no other lands that can be relied upon for such extreme fertility as those which are supplied with water at such times as the vegetation thereon requires it. Hence it is true that lands under culture by well-directed irrigation are more sure to produce abundant crops, with absolute regularity, than the same lands can be

now coming into use, with the prospect of only meeting present demands, but an assurance that all possible requirements of the future will be abundantly supplied. With such a topography as has been described, large numbers of deep and sharp gorges and canyons and ravines must necessarily exist. These open into others of the same kind, or into the valleys, often having very narrow openings, which can be filled at a comparatively small cost, and thus confine at pleasure large bodies of water from the sheds above, to be used as the culturist may desire. And though the streams may, as they often do, "dry up" as is supposed (which is merely a sinking and running under the sand for a distance), these mountain reservoirs have a perennial supply from melting snows, which, in incalculable quantities, pile up every winter on the most elevated points and remain the entire year, giving a supply that absolutely cannot fail.

There are now in the Salt River valley, taking water from the south side of the river, the following canals:

Capacity, inches.	
The Wormser.....	500
Prescot.....	500
Jonesville.....	2,000
Mesa.....	2,000
Tempe.....	3,000

On the north side:	
Farmers.....	1,000
Salt River.....	3,000
Maricopa.....	3,000
Grand.....	7,000
Arizona.....	40,000

The latter is 40 miles in length, and proposes to furnish all the water needed to irrigate 100,000 acres. The company owning this canal sells no water rights except to the owners of land, which rights cannot thereafter be separated from the lands they cover. Hence there are no holdings or "rights" of water stock as articles of commerce; all as soon

as sold become inseparable from the land. These rights entitle the holder to have water (as long as the canal has water in it) at the stipulated price, which is \$1.25 per acre per year, for all the land he cultivates. A person owning land and without water rights cannot obtain water from this company at any price. This is a general rule in all irrigated districts depending upon ditches.

The canals, excepting Arizona, which is the most recently constructed, furnish water for about 45,000 acres now under successful cultivation.

The question of irrigation in Central Arizona is now settled; that is to say, the feasibility of irrigating, at reasonable cost, all or nearly all of the agricultural lands in the district, is beyond doubt. The large supplies from the rivers, through the several canals and ditches, supplemented by the perennial flow from the numerous storage ponds and lakes in the mountains, leave no room to doubt that every cultivator of the soil will find it easy to obtain all the water he may need.

The cultivation of nearly all the irrigable lands, especially in the two great valleys, the Gila and the Salt River, is less difficult than in most districts elsewhere. The soil has a sedimentary surface of several feet in depth, very light and porous, generally free from gravel or rocks and stones, such as are usually met with where land is, in any considerable degree, broken or rolling, and is exceedingly fertile. It is in support of this latter assertion that the Indians occupying the lands now included in the Pima and Gila reservation have cultivated wheat on the same soil where they now cultivate it, more than 200 years without once changing their seed, and their crop of last year was in character better than the average crop of the States in the upper Mississippi valley.

There are now under cultivation, in the Salt River valley and in its immediate vicinity, more than 50,000 acres, and the area is being enlarged with astonishing rapidity. So easy of cultivation is most of the land in this valley that it is no uncommon thing for it to be cleared of the little brush that it bears, and with nothing but the ordinary cultivator run once over it, and sowed to some kind of grass or grain, and in three or four months ripen a good crop without ever having been touched by a plow. The character of the soil is such and is so exactly alike, from the surface to the depth of several feet, that cuttings for raisin grapes are in many cases put into the ground, and make a rapid growth, without any preparation but a single furrow in which to place them. The description here given of the Salt River valley is equally applicable to the Gila and other adjacent valleys of this whole central portion of the Territory.

(To be Continued.)

ARIZONA CANAL—UPPER SECTION OF THE FALLS.

ly illustrated than in those districts where the want of moisture for lack of rainfall is compensated by irrigation.

Long cycles of ages roll by, and cloudless skies, giving no rain, leave vast plains in apparent physical death, producing nothing to please the eye, gratify the taste or support the life of man. Sandy plains is their name, and barren

relied upon to produce when supplied with moisture, only by uncertain rains.

The central portion of Arizona has two large valleys, the Gila and the Salt River, named for the rivers (the two principal ones in the Territory) that run through their length. From these rivers water is taken in ditches, at such times and places as are deemed desirable, and

ARIZONA CANAL—UPPER WASTEWAY.

deserts their cognomen. But the supply of water from nature's reservoirs, in accumulations of snow on tops and sides of broad and long ranges of elevated mountains, is, by the hand of man, not only conducted and spread over the surface of those wide wastes of weariness, transforming them into fertile fields of beauty and wealth, meeting every want of man, but so stored, held in check, controlled and moved at will as to be applied when, and only when, it

spread over the land, by ditch and by flow, so as to produce, under the influence of the clear skies and radiant sun that beam upon and overhang, almost perennially, a volume and wealth of vegetable growth seldom found anywhere outside of the torrid zone. This applies equally well to every production within the range of agriculture and pomology.

In addition to the great idea of ditches, from natural streams, the irrigation by "storage" is

THE STABLE.

State Fair Speed Programme and Entries.

The State Agricultural Society never had a more encouraging outlook than the present one for a successful fair. The space at both park and pavilion is entirely taken up with the most complete exhibition of stock and useful articles as well. The entries for the races are the best ever before offered, and are expected to prove the most exciting ever witnessed in the State. Besides the California list, there will be found quite an addition from over the "Rockies," which will attract attention from people who have never before attended the State Fair. Below will be found a complete list:

First Day, Sept. 15.—Trotting.

No. 1.—Occident Stake. Entries closed in 1885.
No. 2.—Trotting; purse, \$1000; 2:23 class.
W. F. Smith's blk. g. Thapsin, by Brlin-Lady-Hubbard.
Palo Alto Stock Farm's b. c., Rexford, by Electioneer-Rebecca by Gen. Benton.
Jno. E. Moore's b. m. Lotty M., by Nephew-Chieftain.
P. Farrell's b. s. Marin, by Quinn's Patchen-Emigrant.
A. McDowell's c. h. Maid of Oaks, by Duke McLennan-Oregon Nell.
H. Hitchcock's b. g. Black Diamond, by Melton's Goldust-Lady Taylor.
John A. Goldsmith's ch. m. Mamie Comet, by Nutwood-Sportsman.
John A. Goldsmith's b. m. Lillie Stanley, by Whippleton-Dolly McMahan.
B. W. Leven's ch. m. Daisy S., by Tilton Almont-Rattler.
J. H. Kelly's br. g. Valentine, by Farrel Clay-Queen.
Wm. Donathan's ch. m. Magdallah, by Primus-dam unknown.
L. J. Rose's b. s. Stamboul, by Sul an-Fleetwing.
O. A. Hickok's ch. g. John R. Wise, by Hambletonian Tramby-by Plantagenet.
PACIFIC.

No. 3.—Pacing; purse, \$600; 2:30 class.
W. W. Mendenhall's b. g., by Jim Lick.
Frank Weber's ch. g. Haverly.
H. P. Brown's g. g.
A. H. Hecox's br. m. Lela S. by C. P. Duane, by St. Clair.
Eug. Hart's b. g. Fred. Ross, sire and dam unknown.
Geo. Van Gordon's br. g. Home Stake, by Whippleton-dam unknown.
Jno. Warburton's blk. s. Robt. St. Clair, by Jack Roberts-St. Clair.
Durfee & Covarrubias' b. g. Arrow, by Richmond-Crichton.
J. Garrity's b. g. James L., sire and dam unknown.
Alex. Lewis' b. g. Travis, sire and dam unknown.
J. R. Hodson's b. g. Bracelet, by Nephew-by Mambrino.

Second Day, Sept. 16.—Running.

No. 4.—The Introductory Stake, for two-year-olds; \$25 entrance; \$10 forfeit; \$250 added, of which \$50 to second; third to save stake. Winner of any two-year-old race this year to carry 3 lbs.; of two or more, 5 lbs. extra. Three quarters of a mile.
L. H. Todhunter's ch. c. Phoenix, by King Alphonso-Fashionette.
Jas. B. Chase's ch. g. Kildare, by Kyrle Daly-Mistake.
Fairfax Stable's br. f., by Shannon-Tippary, by Tippary.
Fairfax Stable's ch. f. Question, by Monday-Foster, by Foster.
Rancho del Paso's b. g. Monterey, by Kyrle Daly-Comanche.
Rancho del Paso's b. f., by Kyrle Daly-Maid of Stockdale.
C. H. Eldred's b. f. Alma E., for Tricksy, by Joe Hooker-Abbie W.
W. M. Murray's ch. c. Peregrine, by Jumbo or Joe Hooker-Irene Harding.
W. M. Murray's b. c. Surinam, by Joe Hooker-Ada C.
Jas. Garland's ch. f. Snowdrop, by Joe Hooker-Laura Winston.
Owen Bros.' ch. f. Serpolett, by Norfolk-Mattie Glenn.
Laurel Wood Stable's ch. f. Carmen, by Wildidle-Nettie Brown.
Laurel Wood Stable's b. s. Kyrle D., by Kyrle Daly-Maggie S.
H. L. Samuel's b. c. Ed. McGinnis, by Grinstead-Jennie C.
Palo Alto Stock Farm's br. f. imp. George, by Isonomy-imp. Flirt, by The Hermit.
Palo Alto Stock Farm's b. c. Peel, by Monday-Precious, by Lever.
L. H. Todhunter's br. c. King Idle by Wildidle-Augusta E.
No. 5.—The California Breeders' Stakes, for foals of 1884. Closed in 1886, with 12 nominations; \$50 entrance, p. p.; \$300 added, of which \$100 to second; third to save stake. One mile and a quarter.
No. 6.—The Capital City Stake, for four-year-olds; \$50 entrance, h. f., or only \$15 if declared on or before September 1st; \$300 added, of which \$100 to the second; \$50 to the third. Weights, five pounds below the scale; winner of any race over one mile this year to carry rule weight. One mile and five-eighths.
W. P. Todhunter's b. m. May Blossom, by Joe Hooker-Maggie S.
John Wolfskill's br. m. Edelweiss, by Joe Hooker-Yolona.

C. H. Eldred's b. f. Moonlight, by Thad. Stevens-Twilight.
H. Harrison's ch. g. Hello, by Shannon-Marshra.
Laurel Wood Stable's b. m. Patti, by Wildidle-Nettie Brown.
L. H. Todhunter's ch. c. Monte Christo, by King Alphonso-Gailanthus.

No. 7.—Free Purse, \$150; winners of any race this year of the value of \$300 to carry five pounds; maidens allowed if three years old, five pounds; if four years or upwards, fifteen pounds. Mile heats.

W. L. Pritchard's ch. m. Lizzie Dunbar, by Ba-zaar-Tibbie Dunbar.
J. Cabrera's ch. g. Manzanita, by sire and dam unknown.
F. Depnister's br. c. Blackstone, by Wildidle-Monday.
W. P. Todhunter's ch. g. Rock, by Bob Wooley-Miss Stoner.
B. C. Holly's ch. f. Ninena, by Jim Brown-Nannie Hubbard.
Jas. Garland's ch. c. Elwood, by Norfolk-Ballinette.
Owen Bros.' b. s. Oro, by Norfolk-Golden Gate.
Laurel Wood Stable's ch. f. Laura Garden, by Jim Brown-Avail.
Laurel Wood Stable's b. m. Patti, by Wildidle-Nettie Brown.

No. 8.—Two-year-old trotting stake; \$50 entrance, of which \$10 must accompany nomination; \$15 payable July 1st, and remaining \$25 payable August 10, 1887; \$300 added by the society. Closed April 15th, with 18 nominations. Mile heats.

Third Day, Sept. 17.—Trotting.

No. 9.—Trotting; purse \$1000; 2:27 class.
J. A. McLeod's b. s. Mt. Vernon, by Nutwood-Chieftain.
Palo Alto Stock Farm's b. g. Howard, by Electioneer-Mamie by Hambletonian, Jr.
George W. Woodward's Alex. Button, by Alexander-Lady Button.
L. B. Lindsay's br. m. Jane L. by Hamb. Mambrino-by Paul Jones.
A. McDowell's ch. m. Maid of Oaks, by Duke McLennan-Oregon Nell.
H. Hitchcock's b. m. Luella, by Chickamauga.
John A. Goldsmith's b. m. Lillie Stanley, by Whippleton-Dolly McMahan.
J. A. Linscott's b. s. Adrian, by Reliance-Adriana.
A. L. Hind's b. g. Gus Wilkes, by Mamb. Wilkes-Bonner.
Lee Shaner's bl. m. Kate Ewing, by Berlin-Lady Washington.
J. N. Ayers' b. s. Bay Rose, by Sultan-by the Moor.
H. Whiting's b. m. Tempest, by Hawthorne-by Chieftain.
Peter Johnson's blk. g. Scandinavian, by Black Hawk-dam unknown.
W. B. Bradbury's b. g. Old Nick, by Electioneer-Stockton Maid.
L. J. Rose, Jr., b. m. Inez, by The Moor-Katydid.

No. 10.—Trotting; purse, \$1200; 2:17 class.
W. F. Smith's b. g. Adair, by Electioneer-Addie Lee.
I. De Turk's b. s. Anteco, by Electioneer-Columbine.
O. A. Hickok's b. g. Arab, by Arthurton-Lady Hamilton.

Fourth Day, Sept. 19.—Running.

No. 11.—The Premium Stake, for all ages; \$50 entrance, h. f., or only \$15 if declared on or before September 1st, with \$300 added, of which \$100 to second; third to save stake. Horses that have started and not won this year, allowed five pounds. Maidens if three years old allowed five pounds, if four years old or over, seven pounds. Three-quarters of a mile.
Matt. Storm's ch. h. Grover Cleveland, by Monday-Robin Girl.
Rancho Del Paso's br. g. Kenney, by Duke of Montrose-Virgil.
Rancho Del Paso's b. f., by Kyrle Daly-Lodi.
W. P. Todhunter's ch. h. Prince of Norfolk, by Norfolk-Marion.
Fairfax Stable's br. f., by Shannon-Tippary by Tippary.
Fairfax Stable's ch. f. Question, by Monday-Foster by Foster.
John Wolfskill's br. m. Edelweiss, by Joe Hooker-Yolona.
C. H. Eldred's ch. g. Tom Atchison, by Joe Hooker-Bay Kate.
B. C. Holly's ch. f. Fusilade's Last, by John W. Norton-Fusilade.
Geo. W. Trahern's c. m. Blue Bonnet, by Joe Hooker-Kate Carson by Joe Daniels.
James Garland's ch. c. Elwood, by Norfolk-Ballinette.
Owens Bros.' g. g. Johnny Gray, by Shiloh-Margery.
Laurel Wood Stable's ch. f. Carmen, by Wildidle-Nettie Brown.
M. F. Tarpey's ch. m. Not Idle, by Wildidle-Bonanza.
Cockrill Bros.' b. m. Daisy D., by Wheatley-Black Maria.
E. Flinter's b. m. Minnie R., by Scamperdown-Sallie Blair.
Thomas G. Jones' Ruth, by Joe Daniels-Queen Emma.
Thos. G. Jones' b. g. Applause, by Three Cheers-Alice N.
Alex. Lewis' ch. s. Rajah, by Euchre-Formosa.
No. 12.—The California Annual Stake, for foals of 1885; \$100 entrance; \$25 forfeit; \$250 added. Closed in 1886, with 24 nominations. One mile.
No. 13.—The La Rue Stake; handicap for all ages. Two and one-quarter miles.
W. P. Todhunter's b. m. May Blossom, by Joe Hooker-Maggie S.
W. L. Pritchard's ch. m. Lizzie Dunbar, by Ba-zaar-Tibbie Dunbar.
Matt. Storm's b. m. Narcola, by Norfolk-Addie C.
C. H. Eldred's b. f. Moonlight, by Thad Stevens-Twilight.

B. C. Holly's ch. f. Ninena, by Jim Brown-Nannie Hubbard.
G. W. Trahern's b. g. Dave Douglas, by Leinster-Lilly Simpson.
J. C. Simpson's br. c. Rathbone, by imp. Young Prince-Lady Amanda, by imp. Hannah.
Laurel Wood Stable's b. m. Patti, by Wildidle-Nettie Brown.
D. J. McCarty's ch. f. Adeline, by Enquirer-Analyne.
D. J. McCarty's ch. f. Laura Gardiner, by Jim Brown-Avail.
H. Whiting's blk. b. John A., by Monday-Lady Clara.
L. H. Todhunter's ch. c. Monte Cristo, by King Alfonso-Gailanthus.

No. 14.—Selling Purse. One mile and an eighth.
W. P. Todhunter's b. m. May Blossom, by Joe Hooker-Maggie S.
W. P. Todhunter's ch. g. Rock, by Bob Wooley-Miss Stoner.
P. Riley's b. h. Sir Thad, by Thad Stevens-Lady Amanda.
Rancho Del Paso's ch. g. Tom Daly, by Kyrle Daly-Columbia.
Rancho Del Paso's br. g. Kenney, by Duke of Montrose by Virgil.
Rancho Del Paso's —, by Kyrle Daly-Lodi.
Jas. Garland's ch. Elwood, by Norfolk-Ballinette.
Laurel Wood Stable's ch. f. Laura Gardner, by Jim Brown-Avail.
Laurel Wood Stable's b. c. Bolero, by Norfolk-Neapolitan.
E. Flinter's Oscar Wilde.
Frank Dodge's b. g. Bay Rum, by Baywater-a Norfolk mare.
Al. Lewis' ch. s. Rajah, by Euchre-Formosa.

Fifth Day—Sept. 20.

No. 15.—Three-year-old Trotting Stake, for all colts (except Ella, Soudan, Shamrock and Sable Wilkes.) Mile heats three in five. Closed April 15th with 14 nominations.

No. 16.—3:00 class.
Geo. W. Woodward's b. f. Rosie Mc, by Alex. Button-Rosedale.
Palo Alto Stock Farm's b. f. Gertrude Russel, by Electioneer-Winnie by Planet.
J. A. Goldsmith's b. g. Perihelion, by Admiral-Flora.
A. L. Hinds' b. h. Alpheus, by Mambrino Wilkes-Major Mono.
W. H. Seal's b. g. Alfred S., by Elmo-Nora Marshall.
A. C. Davenport's br. s. Alto, by Altoona-Nellie.
S. B. Emerson's br. m. Maggie E., by Nutwood-Geo. M. Patchen, Jr.
C. A. Durfee's b. g. Geronimo, by Inca-Sacramento.
No. 17.—2:20 class.
J. A. Goldsmith's b. m. Sister, by Admiral-Flora.
Lee Shaner's b. g. Lot Slocum, by Electioneer-a Mohawk mare.
William Dwyer's b. s. Menlo, by Nutwood-Hercules.
L. J. Rose's b. s. Stamboul, by Sultan-Fleetwing.
O. A. Hickok's ch. g. John R. Wise, by Hambletonian-Tramby-by Plantagenet.

Sixth Day—Sept. 21.

No. 18.—The Sunny Slope Stake, for two-year-old fillies. Five-eighths of a mile.
W. M. Murray's b. f. Orinda, by Monday-Longfellow.
Fairfax Stables' br. f. Shannon-Tippary, by Tippary.
Fairfax Stables' ch. g. Question, by Monday-Foster, by Foster.
Rancho Del Paso's b. f. by Kyrle Daly-Maid of Stockdale.
Rancho Del Paso's b. f. by Kyrle Daly-Lodi.
J. B. Chase's ch. f. Rosedale, by Joe Hooker-by Joe Daniels.
C. H. Eldred's b. f. Alma E. for Tricksy, by Joe Hooker-Abbie W.
G. W. Trahern's b. f. Sallie Hompton, by Boots-Kate Caren, by Joe Daniels.
James Garland's Snowdrop, by Joe Hooker-Laura Winston.
Owen Bros.' ch. f. Serpolett, by Norfolk-Mattie Glenn.
Laurel Wood Stable's Carmen, by Wildidle-Nettie Brown.
No. 19.—The Shafter Stake, for three-year-olds. One mile and a quarter.
Matt. Storm's b. m. Narcola, by Norfolk-Addie C.
Caleb Dorsey's ch. s. Fred. Archer, by Thad Stevens-imp. Hercules.
E. B. Johnston's ch. f. Etta W., by Joe Hooker-Foster.
Rancho Del Paso's br. g. Denney, by Duke of Montrose-Virgil.
Rancho Del Paso's ch. f. Agnes, by Onondaja-Skylight.
Davis Bros.' b. s. Jack Brady, by Wildidle-Unknown.
J. C. Simpson's br. c. Rathbone by Young Prince-Lady Amanda.
Jas. Garland's ch. c. Elwood, by Norfolk-Ballinette.
M. F. Tarpey's ch. f. Not Idle, by Wildidle-Bonanza.
D. J. McCarty's ch. f. Adeline, by Enquirer-Analyne.
H. Whiting's b. c. Wallace, by Joe Hooker-Countess Zeika.
Thomas G. Jones' b. g. Applause, by Three Cheers-Alice N.
No. 20.—The Del Paso Stake, for all ages. Three-quarter mile heats.
Wm. Cornell's b. h. Hancock, by California-Abbie W.
Rancho Del Paso's b. g. Acton, by Kyrle Daly-Bonnie Kate.
Matt. Storm's ch. h. Grover Cleveland, by Monday-Robin Girl.
C. H. Eldred's ch. g. Tom Atchison, by Joe Hooker-Bay Kate.
Owen Bros.' g. g. Johnny Gray, by Shiloh-Margery.

M. F. Tarpey's ch. f. Not Idle, by Wildidle-Bonanza.
D. J. McCarty's ch. f. Adeline, by Enquirer-Analyne.
Thomas G. Jones' b. m. Ruth, by Joe Daniels-Queen Emma.

No. 21.—Free purse, for all ages. One mile.
F. L. Smith's ch. g. Stanley, by Shannon-Frou-Frou.
W. P. Todhunter's ch. h. Prince of Norfolk, by Norfolk-Marion.
W. P. Todhunter's b. m. Mayblossom, by Joe Hooker-Maggie S.
John Wolfskill's b. m. Edelweiss, by Joe Hooker-Yolona.
C. Dorsey's ch. s. Cyclone, by St. Martin.
Rancho Del Paso's br. g. Kenney, by Duke of Montrose-Virgil.
Rancho Del Paso's b. f. by Kyrle Daly-Maid of Stockdale.
Rancho Del Paso's b. g. Monterey, by Kyrle Daly-Comanche.
W. L. Pritchard's ch. s. Annie Scott, by Leinster-Tibbie Dunbar.
C. H. Eldred's b. f. Moonlight, by Thad Stevens-Twilight.
James Garland's ch. c. Elwood, by Norfolk-Ballinette.
A. Harrison's ch. g. Hello, by Shannon-Marshra.
Owen Bros.' b. s. Oro, by Norfolk-Golden Gate.
Laurel Wood Stable's ch. f. Carmen, by Wildidle-Nettie Brown.
Laurel Wood Stable's b. s. Kyrle D., by Kyrle Daly-Maggie S.
Laurel Wood Stable's ch. f. Laura Gardner, by Jim Brown-Avail.
M. F. Tarpey's ch. f. Not Idle, by Wildidle-Bonanza.
H. L. Samuel's ch. c. Tahoe, by imp. Fletcher-Maritana.
Alex. Lewis' ch. s. Rajah, by Euchre-Formosa.

Seventh Day, Sept. 22.

No. 22.—Trotting purse, \$1000. 2:25 class.
J. A. McCloud's b. s. Mt. Vernon, by Nutwood-by Chieftain.
J. J. Reavis' ch. c. Ned Forrest, by Black Bird-unknown.
Palo Alto Stock Farm's b. g. Spry, by General Benton-Sprite.
B. C. Holly's ch. s. Woodnut by Nutwood-Addie C.
P. Fancee's b. s. Marin, by Quinn's Patchen-by Emigrant.
L. B. Lindsay's br. m. Jane L., by Hamb. Mambrino-by Paul Jones.
A. McDowell's ch. m. Maid of Oaks, by Duke McLennan-Oregon Nell.
San Mateo Stock Farm's b. g. Joe Arthurton, by Arthurton-Flora.
W. H. Seal's ch. g. Longfellow, by Hambletonian-unknown.
J. N. Ayres' b. s. Bay Rose, by Sultan-by The Moor.
No. 23.—Four-year-olds. Trotting stake. Closed April 15th with ten nominations.
No. 24.—Pacing purse, free for all.
P. Fitzgerald's br. s. Killarney, by Black Ralph imp. Eclipse.
W. M. Billup's br. s. Almont Patchen, by Juanita Gladiator.
H. Hitchcock's blk. s. L. C. Lee, by Elmo, Jr.-Kentucky Chief.
J. A. Goldsmith's ch. m. Pocohontas, by Washington-Glencoe.
Lee Shaner's b. g. Chapman.
Durfee & Covarrubias' b. g. Arrow, by Richmond-Crichton.

Eighth Day, Sept. 23.

No. 25.—California Derby Stake, for foals of 1884. Closed in 1885, with 17 nominations.
No. 26.—The Palo Alto Stake, for two-year-olds. One mile.
Rancho Del Paso's b. g. by Monterey, by Kyrle Daly-Comanche.
Rancho Del Paso's b. f. by Kyrle Daly-Maid of Stockdale.
W. M. Murry's ch. c. Peregrine, by Jumbo or Joe Hooker-Irene Harding.
Jas. Garland's ch. f. Snowdrop, by Joe Hooker-Laura Winston.
W. M. Murry's b. c. Surinam, by Hooker-Ada C.
Owen Bros.' b. f. Corona, by Norfolk-sister to Lottery.
Laurel Wood Stable's ch. f. Carmen, by Wildidle-Nettie Brown.
Laurel Wood Stable's b. s. Kyrle D., by Kyrle Daly-Maggie S.
D. J. McCarty's b. c. Bolero, by Norfolk-Neapolitan.
Palo Alto's Stock Farm's br. f. Gorgo, by Isonomy-imp. Flirt, by The Hermit.
Palo Alto Stock Farm's b. c. Peel, by Monday-Precious by Lever.
No. 27.—The Golden Gate Stake, for three-year-olds. One mile and three-quarters.
Matt. Storm's b. m. Narcola, by Norfolk-Addie C.
Davis Bros.' b. c. Jack Brady, by Wildidle-unknown.
J. C. Sampson's br. c. Rathbone, by Young Prince-Lady Amanda.
Jas. Garland's ch. c. Elwood, by Norfolk-Ballinette.
Laurel Wood Stable's ch. f. Adeline, by Enquirer-Analyne.
M. F. Tarpey's ch. f. Not Idle, by Wildidle-Bonanza.
Laurel Wood Stable's ch. f. Laura Gardiner, by Jim Brown-Avail.
H. L. Samuel's ch. c. Tahoe, by Imp. Fletcher-Maritana.
Thomas G. Jones' b. g. Applause, by Three Cheers-Alice N.

No. 28.—Nighthawk Stake, for all ages. One mile.
Rancho Del Paso's ch. f. Argus, by Onondaja-Skylight.
Rancho Del Paso's br. g. Kenney, by Duke of Montrose-Virgil.

(Continued on Page 210)

ALWAYS
Victorious
 —THE—
HOUSER
 Combined
HARVESTER
 AHEAD!

BOTH THE
 Large and Small
HOUSER
 Achieved
 —A—
VICTORY
 OVER ALL
 Competitors.

**THEIR SUPERIORITY HAS AGAIN BEEN PROVEN BY FIELD TRIALS.
 400 IN FIELD USE IN 1887 AND NO FAILURES!**

The past harvest season again demonstrated the fact that for all conditions of grain, light or heavy, standing or down, clean or weedy, the Houser was equal to every emergency and retained its supremacy, which it has held for 10 years past. There is no grain too heavy, weedy, or badly lodged for the Houser to handle.

THE EXTRA CLEANER

As Improved for the season of 1888 and thoroughly tested in 1887, did better work than any other cleaner in use. It excels all others used on Combined Harvesters. The Houser has 30-inch Cylinder, 42x46-inch Separator, Steel, Shafting and Gearing and Double Strap Brake; wide Header Draper, high, wide drive-wheels, and tire from 12 to 24 inches wide as ordered; has harvested grain which yielded 70 bushels per acre, and cut, thrashed, cleaned and sacked ready for market, from 200 to 500 sacks per day, in a good and satisfactory manner. It is so constructed that an Elevator to run the straw into Header Wagons can be attached, or a Dump, leaving the straw in small piles, or Dump Cart with Elevator, leaving it in large piles.

SMALL HOUSER.

To meet the demand for a Smaller, Lighter Harvester with narrower cut, adapted for Small Farms and Rolling Foothill land, and which can be run with three men and from 12 to 14 animals, we constructed a

LIGHT 10-FOOT CUT HOUSER HARVESTER. IN WEIGHT $\frac{1}{2}$ OF THE LARGE HOUSER.

A Pull and Belt Machine, strong and easily handled. The Header part is rigid, but can be readily detached.

HAS OUR IMPROVED 36-INCH DOUBLE SHOE CLEANER,

12-inch Cylinder Pulley; 33x8-inch front Lead Wheel Separator 37 inches and Cylinder 27 inches. It was given a thorough test in different conditions of soil and grain; cutting from 18 to 25 acres per day with 12 animals on hard lands, and gave satisfactory results in every respect.

Will Build Them to Order From 10 to 12 Feet Cut.

It is the machine for thousands of Farmers in this State.

As the Large Houser is the Leading Harvester for large grain fields, so will the Small Houser prove for small fields.

BOTH THE LARGE AND SMALL HOUSER WILL BE ON EXHIBITION AT THE STATE FAIR, SACRAMENTO, AND DISTRICT FAIR AT ST CKTON.

Send for Circulars. Correspondence solicited. For further information, prices, etc., address S. C. H. & A. W., Box M, Stockton, Cal., or

Stockton Combined Harvester & Agricultural Works, Stockton, San Joaquin Co., Cal.

319 and 321
 MARKET STREET,
 SAN FRANCISCO.

FRANK BROTHERS,

319 and 321
 MARKET STREET,
 SAN FRANCISCO.

SOLE PACIFIC COAST AGENTS FOR THE

NEW MODEL GANG PLOW! TWO, THREE AND FOUR FURROWS.

Is more easily handled, is lighter draft, and more readily adjusted than any other Gang.

Its patent lever is used on no other plow, and has no equal for perfect and easy control of the Gang.

The axles are adjustable, as well as the land, for which there is a special lever. The wheels are strong, with wide tires, and the beams are high, obviating all danger of choking.

The bottoms are similar to those used on the celebrated Rock Island Plows, and give the New Model the lightest draft of any Gang in the world.

In ordinary conditions of soil the New Model Gang will turn a 24-inch furrow with the same power (three horses) required on a 16-inch hand-plow or sulky, a saving of 50 per cent in labor and cost of plowing; in short, the New Model Plow will turn over more land per day, with less expenditure of horse and man power, than any other wheel plow in the market.

Its economy of operation, ease of handling, lightness of weight and draft, simplicity, durability, and cheapness, are points which cannot fail to attract attention, and convince every wide-awake farmer of its superiority and economy over any other plow ever placed in the market.

The New Model has been thoroughly tested throughout the San Joaquin and Sacramento Valleys, and with the valuable improvements for 1887-88, cannot be approached by any other plow.

BUGGIES, PHÆTONS, BUCKBOARDS, CARTS, HARNESS, ETC., ETC.,

Comprising every style of vehicle sold on the coast, and all grades. Send for Illustrated Catalogue and you will find just what you want.

Six Kinds of Buckboards.

THE CELEBRATED FLINT ROADCART, "A" Grade.

The Strongest Built, Lightest, and Handsomest in the Market.

Double, Single Track, Livery and Ranch Harness.

And a full line of

AGRICULTURAL IMPLEMENTS, WAGONS, GARDEN TOOLS.

The Stockton Fair.

One cannot miss it by going to the Stockton fair this year. The exhibition will open Sept. 26th, and continue during the week. The new pavilion will be ready in time, and its opening is to be the occasion for a grand rally of the people to make the indoor display of field, orchard and garden products, domestic manufactures, and needle-work, and the fine arts, worthy of the district and of the handsome building which will inclose and shelter it. Our Stockton correspondent last week gave an intimation of what was proposed in this direction, and we trust that all will lend aid to the same ends.

We gave some weeks ago a large engraving of the new pavilion, and as the fair is now at hand we give the picture of the building in reduced form. The following interesting descriptive notes are from a letter to the *Bulletin* of last week:

The Agricultural Association's new pavilion, now being completed at Stockton, is one of the finest buildings of the kind on the coast, and is being built at a remarkably low figure—not more than \$60,000, including the extras. The nine grand pagoda towers now loom up the most prominent object in this prosperous city of 18,000 inhabitants, and can be seen for miles away from the various roads leading into town. The structure is in the form of a Greek cross and occupies the whole of the space of Washington square, around which a man must travel 1200 feet before he comes back to the starting point. The tops of the eight flag-staffs on the towers rise to an altitude of 126 feet, while the vein on top of the central tower attains a much higher level. In each of the four corners made by the intersection of the arms of the cross there is a glass conservatory, which serves a double purpose, that of lighting up the main floor and of displaying the varied and choice vegetation that flourishes almost without the care of man in the prolific soil and under the genial warmth of the great San Joaquin valley. The conservatories are 30x30 feet on the ground floor and have 40-foot ceilings. As will be observed by the illustration, these conservatories are very prettily shaped and impart a pleasing ornamental effect to the building.

The Great Hall.

There are three grand entrances to the structure, each 20 feet in width and 30 feet from the outer to the inner doors. Although the building covers all the ground in this square—300x300 feet—except a small patch at each of the four corners, no adequate idea of its size can be gained without an inspection of the interior. Standing in any one of the doorways the spectator sees a grand hall 300 feet long by the same width, following the arms of the cross, and encircled by a broad gallery at a distance of 20 feet from the floor. The gallery is prettily set off by a "cut-work" balustrade, while the walls of the hall gleam with polished panels of redwood and pine, set alternately and showing the full beauty of the natural grain of California's most valuable and abundant wood. Separated, but only technically, from the main floor, by arches, are an art gallery 80 by 90 feet, and two dancing-halls of similar dimensions. On each side of the San Joaquin-street entrance are the offices, reception-rooms, etc., seven in number, each 30 by 30 feet and with 13-foot ceilings in the clear. These apartments are all hard-finished and liberally lighted with frosted-glass windows. On what is called the third floor—for the second and third floors are only on the sides of the building, leaving the main hall clear from the floor to the center of the great dome—is an ice-cream and banqueting hall. This is 30x90 feet in dimensions. The building will be lighted with no less than 130 electric lights besides innumerable gas jets. The machinery to be placed on exhibition in the pavilion will be operated by a steam-engine in a room at the south end of the structure. The interior will comfortably seat from 10,000 to 12,000 people, cautious conserv-

ative persons fixing the number at 10,000, while others of good judgment say that a seating capacity of 12,000 would be nearer the truth.

The building will be painted in two colors on the outside, and this will give it a picturesque appearance. The eight towers are modeled somewhat after the manner of a Chinese pagoda, which makes the architecture at once unique and striking. Besides this the outside

dress drills, etc. The stock show and speed affair at the park will be quite up to the mark, as a long string of fine horses are entered, and several herds of live-stock will be shown.

A Pleasant Rural Dwelling.

We give on this page a view from a photograph of the residence of John T. Deming, situated in a picturesque spot on Carquinez

THE NEW AGRICULTURAL PAVILION AT STOCKTON.

of the edifice is embellished with Eastlake and bizarre millwork, giving the whole an appropriate holiday appearance.

D. Burns, the contractor and his foreman, Herbert Waite, say that the work will be finished and the building ready for occupancy before the 15th inst. Credit for the architectural designs is due to Charles Beaseley of Stockton.

The people of Stockton are justly proud of their new pavilion, an enterprise which they

straits, which has been appropriately named Glen Cove. The house is spacious and well planned, and the surroundings retired but not solitary, for the outlook is upon the narrow channel through which the waters of the Sacramento and San Joaquin find entrance to San Francisco bay, and upon these waters ply fleets of steamers and sailing vessels which seek the interior landings for freight and passengers. Across the strait, too, are the famous wheat-shipping wharves, the great mills and ware-

A Drive in Southern Humboldt.

EDITORS PRESS:—It is indeed a fine trip, presenting great variety of scenes, to leave Ferndale, with its rich alfalfa and red clover, which is growing all the year—the land of heavy fog, of sleek cattle and large dairy ranches, where they hardly ever stop milking—and to go along the base of the hills till you come to the beach; then, quitting the road, take six miles of beach drive.

The tide was high when I passed, and so was the sand on the buggy wheels and fetlocks of my "thoroughbred," but I made, without any exaggeration, a mile every two hours, more or less. Then, after having an excellent view of the fog and a few large boulders, and the heavy surf rolling in, we leave the beach at a large hill (where the road looks perpendicular or a little more so), rise some 250 feet in about an eighth of a mile, and find ourselves on a ridge where we can see the fog on one side; on the other, hill after hill. Every little way for this country, 15 or 20 miles we see a farmhouse.

Finally we start to descend the hill to Bear river (this is where the tax collector reports there are no men or dogs—only boys and pups. He found no one to collect taxes from, as they were all under age). It is a fine valley full of dairies. They will be milking till November. The station sets on the banks of the river, surrounded with trees—the first we have met—spruce, fir, pine and a few redwood.

We slowly ascend the hills, like the King of France, only to go down again, meeting with but one horse on the road (and as the Irishman said, that was a mile off) going to Cape Mendocino. The Signal Station is just above us. We descend to the beach again at the Ocean house and have another drive, this one being better than the last. We drive along and have really a grand view of the ocean, as the fog has lifted. In fact, they have but few foggy days this way. We slowly climb Zannoni hill, and when on top have a glorious prospect. Petrolia in the distance, lined with trees, flanked with green hills, the plain dotted with hay-stacks and buildings, the stubble on the ground, making a fine contrast.

Going through Petrolia, which is a growing town with many fine residences, but isolated, being 32 miles from Ferndale, we pass up the Mattole river. Crossing and recrossing five or six times, we come to Upper Mattole, and thence start to climb to Kenoyer's place, on top of Wilder Ridge. The road runs along among massive trees, the silence broken only by the chirp of quail and other birds. I found the woods on fire, and at one place had to wait till the fire burnt out, in order to get by, as the red tongues of flame were leaping up 20 feet, and a large spruce about five feet through, was burning from top to bottom.

Some five miles from Shelter Cove we again got a fine view of the ocean and hills in the distance. We left one hill only to climb another, until we reached the Mattole river near its headwaters, went through quite a large valley where they were busy haying, and finally reached Garberville, the land of the p

ranches. Coming down Eel river—the south fork—we pass through forests of redwood—fine straight timber. At Myers there is a nice orchard, some of the trees loaded with the finest peaches I ever saw, without any exception. I saw two that actually weighed one-half pound, a box (peach box), packed with only four wide, touching both sides of the box and striking top and bottom.

We start again—the hardest job we have struck yet! After passing a small mill, we cross the river at the junction with main Eel river, and continuing through bottoms with an occasional glimpse of the river and hills on the other side, the trees towering up tier above tier, till the hills seem to meet the sky in the distance.

At Springville I saw a field of grain that had been half cut, and the whole crop was eight inches high.

Eureka, August 1887.

E. C. S.

GLEN COVE, CARQUINEZ STRAITS, RESIDENCE OF JOHN F. DEMING, ESQ.

owe to L. U. Shippee, the leading banker and manufacturer and President of the District and State Agricultural Associations.

Two committees of citizens, one of 100 ladies and one of 100 gentlemen, have charge of the matter of superintending the display in the Pavilion.

The erection of this Pavilion marks a new era in the prosperity of San Joaquin county.

Arrangements for the Fair.

The fair at the park will last for six days, and the pavilion display will continue 11 days. Admission to the park before 10 A. M. will be 25 cents; during the daytime, entrance at the pavilion will be 25 cents and in the evening 50 cents. Especial effort will be made to make the evenings at the pavilion notable for brilliance and for pleasing entertainment aside from the study of the exhibits. The program will change every evening, and will include dancing, fancy-

houses which have given to Carquinez straits great prominence during the last few years. Here, too, the great overland traffic passes from both northern and southern routes. The present activity and great enterprises contemplated for the future make Glen Cove one of the most interesting and valuable situations in the State.

Glen Cove is a type of a limited number of commanding situations which will soon be sought out and held in high esteem as homes of country gentlemen. While there is almost any amount of good land in this State susceptible of improvement, the specially fine situations are comparatively few, and those who own them may honestly congratulate themselves. We are evidently on the eve of a great advancement in California which will benefit all good land and will make especially valuable all picturesque and commanding locations which are near centers of population and avenues of travel.

SCIENTIFIC FEED MILLS

FOR GRINDING ALL KINDS OF GRAIN,
EAR CORN IN THE HUSK,
AND
Egyptian Corn in the Head.

No. 4, Mill Set Up.

No. 4, Mill Taken Apart.

No. 0 Junior Mill.

It is the only mill having all the following provisions, and is the most practical thing of the kind ever invented:

The Grinding Plates are a Special Metal, Hard as Steel guaranteed to grind 5000 to 8000 bushels before wearing out, and then easily and cheaply replaced.

All the Bearings are in one casting, consequently are always in line and cannot get out of true.

The Journals are habbitted with the best metal, and can be adjusted to take up the wear. The Main and only Shaft is of the finest cold-rolled steel of large size and perfectly true.

The Fly-Wheel and Pulley are turned and, with the RUNNING PLATE, are balanced accurately, so run perfectly true, without any shaking.

The High Discharge is most convenient for delivering the feed, and as it draws a current of air through, it prevents heating, as is frequently the case with Iron Mills.

The Pin Breaker provides against danger to mill should iron, steel or any hard substance accidentally go between the plates.

The Feeder provides a successful means of regulating the feed when grinding small grain. Altogether making the Scientific Mill the MOST PRACTICAL THING OF THE KIND EVER INVENTED.

The Scientific is the Simplest. Can be taken apart and put together in a short time without the aid of a mechanic.

The Strongest. All parts are heavy and well-braced and especially adapted to the work.

The Most Durable. Can be run in either direction by simply changing the spout and crossing the belt. This gives double wearing capacity to the plates as they SHARPEN THEMSELVES each time they are reversed.

ROSS HAY AND ENSILAGE CUTTERS.

WITH MOST WONDERFUL CAPACITY.

These Cutters have been awarded Highest Honors wherever exhibited,

INCLUDING

First Premiums at California State Fairs and Mechanics' Fair, San Francisco, for several years past.

Built in 12 Sizes for Hand and Power.

With or Without Indestructable Carriers for removing the cut feed.

Not only will our machines cut double the amount of every kind of material that can be cut by any machine in the world and run with less power, but they are more thoroughly constructed, and are the heaviest, strongest and most durable made, highly finished, do not get out of order, and are exactly as recommended.

We refer to the Largest Stock-raisers on the Pacific Coast,

All of whom are using these cutters with the greatest satisfaction.

Call and examine our Cutters and Mills.

Get our Guarantee and Compare Prices.

WE ARE SELLING Ross Cutters

To parties who have previously done their cutting to great disadvantage with inferior downward-cut machines which waste both time and power, and soon wearing out, become worthless.

A poor feed-cutter is a most unprofitable piece of machinery, that should be replaced at once with the Ross which will soon pay for itself in the saving of time alone.

DRY FODDER.

Farmers are beginning to realize the importance and necessity of grinding grain and cutting all fodder that is fed upon the farm. In European countries, where careful and economical farming is a necessity to meet the heavy rents and taxes there imposed, every pound of fodder is cut before feeding, and nothing is fed whole. A record of reports from farmers as to the saving in cutting all kinds of fodder shows that, with hay, an average of nearly one ton in three is saved, while with corn fodder a greater saving is made, according to manner of cutting and care in feeding; and, in addition to this, a great improvement in the condition of every kind of stock is reported, as well as a better quality and condition of manure is produced. Our cutters are adapted to every kind of fodder, including the largest of cornstalks, hard ears and all.

ENSLIAGE.

The Ensilage system is one of rapid growth, and has come to stay. In the United States there were 6 silos in 1830 and 2000 in 1885, and in England 4 silos in 1880 and 1183 in 1885. There is no system in use upon the farms to-day that produces as large a return for so small an outlay as Ensilage—a large saving in cost of feeding, great increase in milk and flesh, and improved manure. Send 2-cent stamp for our work on Ensilage, large book of 100 pages, free to our farmer and other friends.

HORTICULTURE.

Oranges In Japan.

[Written for the RURAL PRESS by H. BERGER.]

Passing through the streets of any Japanese village or through the Japanese portion of the large cities open to Europeans, the quantity of oranges heaped in pyramids or filling large baskets at different stalls or booths must attract the attention of a casual observer, much more one interested in fruit culture, and all pertaining to it.

On closer examination, we find that by far the greater majority of these oranges belong to the variety known to us as the Mandarin orange. The main characteristics of this species are in their being flattened at both ends; the rind separating easily from the pulp, without the use of a knife; the segments dividing readily; the pulp is generally of a deep orange color, sweet with slightly sub-acid qualities; containing few or no seeds. The size is small to medium, the largest not exceeding two and one-half to three inches in diameter. The flavor is agreeable, though very distinct from any of our Los Angeles, Riverside or Florida oranges. Among these flattened citrus fruits the better varieties are known as Tou-Mikan, Kino-Kuni Mikan, both quite small fruited, some varieties of Unshiu medium, and the Kii-Seedless, which is one of the largest and best of the above-named sorts.

The main bulk of these oranges is produced in the south of Japan, where, also, the young trees are raised.

Visit to a Japanese Orange Garden.

To one who bears in mind the orange groves of Italy, "where the citron blooms, where among the dusky foliage the gold of the orange shineth," as Goethe speaks of in "Mignon," or who has visited the glorious orange gardens of Southern California or had a look down the vista of a well-kept orange plantation in Florida, the sight of the Japanese institutions of that sort is extremely disappointing. Instead of the standard trees trimmed into leafy crowns, extending for the most part in symmetrical rows, we saw a quantity of trees resembling more our native scrub oaks than anything else. They were of low, stubby appearance, with wide-spreading branches. The foliage, which in the younger trees appears a bright green, in these elder gnarled trees was of a deep hue. But for the blossoms, which were unmistakably "orange flowers," and just then appeared along the branches, we should not have recognized the trees, our idea of orange trees was so different. We could hardly credit our senses until having made a closer inspection. The reason given us for this low and spreading growth in orange culture was the fear of typhoons, which at certain seasons of the year sweep the country and would leave but a sad picture of ruin among a grove of standard trees grafted three or four feet above the ground. The Japanese orange trees are grafted or budded very low on the citrus trifoliata stocks and allowed to grow as bushy as possible; the main leader is continually cut off to allow all the side branches to spread, and one old orange tree which we measured was but six and a half feet in height and extended its outer branches over 30 feet in circumference.

The budding or grafting is done early in spring; the young plants setting about six inches apart in rows, are covered lightly with brushwood to protect them from the too fierce heat of the sun. These young trees make a good growth the first season—and as a rule bloom the second year from the bud—maturing fruit in some cases. The insect which I found most infecting the different varieties of oranges, but especially the flattened sorts, is a small parasite which nests in the leaf, which he causes to curl up, and draw itself up in all sorts of shapes.

Another peculiarity in these leaves is that some of them are punctuated as with the sharp sting of an insect, making pointed elevations on the surface of the leaf. I could not ascertain the cause of this.

No danger is, however, to be apprehended if strict precautions are taken before shipment of young trees from Japan; and vigilance on the part of our nurserymen's associations here against allowing any infected trees to be distributed. The idea has prevailed that Japanese orange trees were of a dwarf growth—this is likely, owing to the fact that the Japanese, with their great preference of dwarfing plants, raise a great many orange trees in pots, where, of course, the growth is more or less stunted; the other reason is the prevalence of typhoons as above mentioned. I have in the South seen a few trees growing in sheltered situations which were over 20 feet in height.

During the months of April and May young orange trees are peddled around the country and bought up by the peasant farmers, almost every patch of ground in the southern provinces boasting of a few orange trees. Besides the different flat or Mandarin sorts a few others merit attention.

The Yud-zu.

This orange is one of the hardiest oranges known; grows in some of the northern provinces. As a table fruit it is not to be recommended, but, using the rind and pulp for marmalade, it is delicious, and by actual trial I know it to be superior to the celebrated Dundee marmalade. This is owing to the fragrance of the rind; the fruit grows to be large. This variety for its hardness and superior flavor for

the manufacture of jellies should be largely planted, and prove valuable. Another fine variety is the

The Kunembo.

An orange which attains a fair size, but whose looks are not very attractive, the rind being covered with excrescences like warts. The flesh is sweet, juicy, and peculiarly aromatic; this latter quality has given rise to a fabulous report about this variety having originally been grafted on a pine tree, and therefrom gaining flavor.

The Dai-Dai.

Or summer orange; this fruit gets to be quite large, round, somewhat oblate. Rind is thick; the color, which is a bright yellow the first year, changes to a deeper tinge the second season. It remains on the tree two years, when it becomes very sweet, juicy, and is a fine table fruit. This variety is only found rarely in Japan.

Canton Hybrid.

Which came originally from China. This orange is a very late keeping sort; the pulp adheres closely to the rind; is very juicy, of a delicious flavor, contains very few seeds. The shape of the fruit is globular, color a rather dark yellow. The stock of this variety is as yet very limited. We must not forget to mention the

Kin-Kan Orange or Citrus Japonica.

This variety can truthfully be called hardy; trees have been known to bear winters in and around Yokohama, where the thermometer falls to 15° above zero. This orange is small, attaining in open ground the size of a medium egg plum. The shape is oblong; color, a bright yellow; the rind is as thin as a cherry's, is eaten with the pulp, which is sub acid—very cooling; the rind is sweet and very aromatic. This fruit is very much eaten in its raw state throughout Japan, where, at some family gatherings, pot plants, laden with the ripe fruit, are placed upon the table, to be picked off by the guests. It is extensively used for cooling drinks instead of limes or slices of lemon, imparting a very fine flavor to the liquid. For the purpose of crystallizing or preserving, this fruit has no equal among the citrus family, blending, as it does, the aroma of the orange with the acid of the lemon or lime. There is no doubt that in our glorious climate, so adapted to orange culture, this fruit would improve in every way, in size and flavor. It is admirably adapted for pot culture, where open ground is not available. The profuseness of its blossoms is remarkable, and the branches are literally bending under the weight of the golden fruits. The trees begin to bear when quite young, attain a height of from 12 to 18 feet, inclined to grow into bushy pyramids, but can be trimmed into any shape desired. Would not, with the prevailing dryness of our California climate, a low standard for the culture of orange trees be quite as advisable, with the branches spreading not too high above the ground? The surface would be somewhat protected, retaining the moisture so necessary to the roots.

Throughout Japan the custom prevails of watering all young trees, fields, etc., with night soil, which malodorous practice makes a visit to any, or a trip through a garden anything but a treat to the olfactory nerves; the stench arising from the earth when distilled by the hot rays of the sun is simply vile, but the soil, exhausted by centuries of constant planting, needs all the fertilizers available.

Let us here urge the necessity of planting orange trees as well as other fruit trees not later than the month of January, to give the roots a chance to establish themselves in the ground with the winter rains, and acquire strength before the heat of summer is on them. From reports sent to us from various points in the State of California and throughout the Atlantic Gulf States, where seasons are similar to ours, I glean the facts that all trees sent by us early in season, during December and January, have thrived well, whereas those sent as late as middle of March have not made any promising growth, some even being a total failure. Planting trees after the first good rains of the season, with more rain in prospect, is one of the main points of success.

Keiffer Pear Leaves Dropping.

EDITORS PRESS:—I have a number of Keiffer Hybrid pears in my orchard. About two weeks ago the leaves on one tree commenced to turn dark brown and dry up. A few days afterward I noticed another doing the same. The wood seems to be fresh and smooth as ever. Generally they are the last to drop their leaves. If some of the readers of your valuable paper could tell me what ails the trees I would be very much obliged. D. A. W.

Nuevo, Cal., Aug. 27, 1887.

A Day's Budding in '54.

EDITORS PRESS:—That day's budding at Martinez by Mr. Holliday and his brother George on August 11th was a good one, but in September, 1854, at the old Soscol nurseries and orchards, Napa county, James Watson, a graduate from Elwanger & Barry of Rochester, N. Y., cut, set and tied 1500 apple buds in ten hours, and but three per cent of them missed. That was when the nursery business in California was in its infancy and horticulture in its swaddling clothes. Whet your knife and try it again, Mr. Holliday. AN EYE WITNESS. Vacaville, Sept. 3d.

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 252 Market St., S. F.**

H. H. H. HORSE LINIMENT.
FOR MAN OR BEAST.
P. O. ST. 1866.
THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Sholders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all druggists.

THE DAIRY.

Centrifugal Separator Field Extended.

So many of the De Laval Centrifugal cream separators are now in use in Pacific Coast dairies, and so many other dairymen are contemplating the introduction of them that we believe some notes of the new styles now being manufactured to extend their applicability, will be read with interest. The Pacific Coast agents, G. G. Wickson & Co., 3 and 5 Front St., S. F., now have three styles of the De Laval, besides the regular machine which has been set up hitherto.

First is the "increased capacity" separator, which uses the same driving power as the regular separator but has twice the capacity, and is sold at a comparatively small advance in price. Some who have the regular machine, and desire more, are putting in the increased capacity separator. This is the case with the Steele Bros., of San Luis Obispo, who, after using the regular machine for about a year with satisfaction, have put one of the increased capacity in an adjoining dairy. The style of this machine is the same as the "regular" which has already been illustrated and described in our columns.

A Hand-Power Separator.

Another style of the De Laval which will interest many readers, is shown in Fig. 1 of the en-

fixed at the inlet on the steam pipe close to the turbine. With no belts and shafting, it requires very little room, the bottom of this machine measuring only 3x2 feet, and it can be placed in any corner without any foundation whatever. The steam turbine can also be applied to churns, and there are already several turbine dairies of considerable extent erected in Sweden.

All the styles of the De Laval and a full line of dairy supplies can be seen at Wickson & Co's dairy implement establishment at 3 and 5 Front St. They will also be shown at the leading fairs. At the Petaluma Fair last week, a premium of \$25 was awarded to the De Laval.

Vacaville Notes.

EDITORS PRESS:—The rush of the peach crop is over for this season. Most of the clings are gathered. The Orange, Lemon, Porter, McKevitt and Roseville clings are most grown here. The Salway and Pickets, both free-stone, are yet to come. There are a few other varieties, but these are the main late ones. There was considerable excitement about fruit last week. Buyers were running in all directions, and giving two and three cents per pound for peaches that would not sell for one cent a short time ago. Dried peaches are selling from 12 to 15 cents for unpeeled and 20 to 24 for peeled. Some wine grapes have been sent to S. F. and sold for \$20 per ton.

Help is pretty scarce, though tramps seem

FIG. 1.—HAND SEPARATOR.

DE LAVAL CENTRIFUGAL CREAM SEPARATORS.

graving on this page. It is the De Laval Vertical Hand Separator, and promises to be of great value to owners of small herds or for family or hotel use. It is said to have a skimming capacity of 250 to 300 pounds per hour. This machine is constructed on the same principles as the usual well-known De Laval. The revolving cylinder has been lightened by shortening its radius, but with elongated walls, and is like its predecessor, pressed into shape from one solid piece of the best Swedish steel, thus offering all the guarantees of strength and durability which have made the larger machines so popular. The speed (6500 revolutions a minute), it is said, can be easily kept up by any man or woman of ordinary strength. It is easy to clean, every part of it being easy of access. No sliding belts whatever are used, so that 40 turns of the crank a minute make the proper speed of the cylinder a certainty.

The Turbine Separator.

Another style of the De Laval is shown in Fig. 2 and is called the Turbine, because the motive power is furnished by a jet of steam admitted near the base of the machine, as shown in the engraving. This separator does not require any engine or the usual means of communicating power, because the spindle carrying the cylinder is driven directly by a jet of steam, and by a very clever device the turbine is so constructed that the wear from friction renders the running bearing or joint more and more steam-tight instead of causing it to leak. It is claimed that the consumption of steam is about the same per horse-power as when engines are used, but the saving in the first cost of establishing a factory and in the running expenses is therefore considerable. No mechanical knowledge is required for managing it, the speed being regulated by opening or closing a common steam cock, raising or lowering the steam pressure, which is indicated by a usual steam gauge

FIG. 2.—TURBINE SEPARATOR.

plenty. Chinamen are asking \$1.25 per day, and most of those who could get away have gone to the hayfields.

Several places have been sold about Vacaville lately. The Wilson place, containing about 160 acres, set to trees and vines four years, sold at \$600 per acre.

Most of the fruit-growers are doing well this year. They have had good crops and good prices, but every sweet has its bitter, and a great many engaged or sold their crops of dried fruit at 10 and 16 cents per pound, and now the knowledge that they could have got four or five cents more, if they had not sold so soon, takes all the pleasure out of getting a good price.

It sprinkled a little last night and threatens to-day. Rain now would do much damage to the large quantity of fruit which is out to dry, but by piling up the trays and keeping a close watch of the barometer, we hope to save it from serious wetting.

Vacaville, Sept. 5, 1887.

SUPERB APPLES.—In March, 1881, E. Leedham of Arroyo Grande, set out 20 Gravenstein apple trees—then one year old—which are now about eight inches in diameter and this season bore about 400 pounds of fruit each. Mr. Leedham (who is San Luis Obispo County's Commissioner at the Mechanics' Fair) has favored us with a big box of the apples. The largest of them measured nearer 12 than 11 inches in girth. Their rich coloring delighted the eyes, their fragrance the olfactories, and their juicy, fine-flavored pulp the palates of many employed about the office of the RURAL PRESS.

ACKNOWLEDGEMENT.—We acknowledge with thanks complimentary cards of admission to the following fairs: Mechanics Institute, San Francisco; State Fair, Sacramento; Pomological, Los Angeles.

Los Angeles Pomological Society's Fair.

A Horticultural and Industrial Exposition is to be held in Hazard's pavilion, Los Angeles, next week, under the management of the Los Angeles County Pomological Society. Judging merely from the neat little pamphlet, giving names of officers, rules and premium list, which comes to us with the compliments of President Hiram Hamilton, one might safely infer that the preparations had been long in making, and that, too, with great care and painstaking. But we know from other sources that the committee have been putting forth unusual efforts to render the approaching fair the finest ever seen in that county.

The enumeration of articles for which medals and cash premiums are offered is very full, covering upward of 20 pages and embracing machinery and implements textile fabrics, needle, wax and fancy-work, painting and

The Gorham Combined Seeder and Cultivator is a strong, substantial implement. It is fifteen years since we commenced the sale of the "GORHAM," and during that time the machine has been constantly and steadily gaining in public favor. It possesses many features of merit peculiar to it alone, to which we invite the careful attention and consideration of every farmer contemplating the purchase of a Seeder.

It is the most complete combination of Seeder and Cultivator in use and sows peatily all kinds of grain and other small seeds from the box. It has stood the most severe tests of time and use, and is now the standard Seeder of the Pacific Coast.

THE GORHAM SEEDER AND CULTIVATOR.

Its simplicity of construction enables it to be operated by any ordinary farm hand, and does not require a mechanical expert to handle it.

We put on all these machines the "Flat Scatterer," by which the grain is discharged upon the ground in a current about two feet broad and extending the entire length of the machine, parallel with the seed box. Another important advantage is that the grain is scattered before it comes in contact with the wind; and we can assure our patrons that no common disturbance of the air can affect the working of the machine.

A Lever of improved device for lifting and carrying the shovels is put on each machine.

We have placed the scatterer on the front side of seed box, which enables us to attach the drag bar further forward, making the machine more compact, higher draft, and better balanced.

Our new Adjustable Slip Tooth device, a novelty in its way, was well tested six seasons, and gave entire satisfaction to all who tried them.

We can, with confidence and pride, refer to thousands who are using it, knowing that they who have practically tested it, and are most thoroughly acquainted with it, are its warmest friends and admirers.

By comparison the "GORHAM" will be found to be inferior in no respects, equal in all respects, and superior in many respects to any Seeder made.

The Pacific Mutual.

This company, the Pacific Mutual Life Insurance Company of California, is the only company of its kind organized upon the Pacific Coast. It was established in 1867, over 20 years ago, having, therefore, the virtue of age as well as reliability. Accident insurance may be had in this company by the day, week, month or year. Life insurance on all approved plans. Its policies are just, liberal, equitable, world-wide, and definite. The Pacific Mutual is the only Life and Accident Insurance Company transacting business in the U. S. whose stockholders are by law made liable for the debts of the corporation, and whose Directors are made responsible for the acts of its officers. Its assets exceed \$1,600,000. No medical examination is required in order to secure an Accident Policy. Accident indemnity claims extend through 30 weeks instead of being limited to 26, as is the case with other companies. All claims are paid immediately on reception of satisfactory proofs. Annuities, secured by deposit with the State of California, for sale upon favorable terms. Capable and reliable agents are wanted by the company, whose officers are as follows: George A. Moore, President; Geo. W. Beaver, Vice-President; W. R. Cluness, M. D., Medical Director; J. N. Patton, Secretary; Samuel M. Marks, Assistant Secretary; Wm. O. Gould, Actuary; Thos. Bennet, General Superintendent; Chas. N. Fox, Attorney. Directors: Robert Sherwood, Geo. W. Beaver, L. S. Adams, C. Waterhouse, W. T. Garratt, W. R. Cluness, Samuel Lavenson, Geo. A. Moore, J. F. Houghton, Hugh M. Larue, D. W. Earl, Chas. N. Fox, L. P. Drexler, Jas. Carolan, Henry T. Scott. Main office, 418 California St., San Francisco.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

The New Panorama Building, Corner of Tenth and Market Sts., S. F.

Missionary Ridge.

The magnificent battle panorama of the "Storming of Missionary Ridge," Nov. 25th, 1863, painted under the supervision of William Wehner, is now on exhibition at the corner of Tenth and Market streets, San Francisco, and should be seen by every lover of artistic excellence and historical accuracy, portrayed on canvas. "The battle of Chattanooga," says Dr. Draper in his "History of the Civil War," "was the most brilliant of the battles fought by Grant, and certainly the most picturesque of the war." Perhaps no great battle-scene was ever framed in such a magnificent landscape, and happily has the artist seized upon the most salient point of observation. It is on a spur of Missionary Ridge, just within the Confederate lines. Five States are in sight. In magnificent perspective may be seen the dim peaks of the Blue Ridge in Virginia, the

Ridge. This charge is the main feature of the panorama. A sort of haze rests over the landscape, for it is now 4 o'clock in the afternoon, and the sun is dropping out of sight behind the hills. A thin cloud flecks the shaggy brow of Lookout Mountain, but a good eye may see the spectral flag of the Seventh Kentucky floating from the top-most crest. Hooker has already fought the battle above the clouds.

In studying this picture the observer will bear in mind that Grant's plan was to break the enemy's center. To do this it was necessary to weaken it. Sherman and Hooker were therefore to press on the two flanks so as to compel reinforcements to be detached to them from the center. As soon as that was sufficiently weakened, Thomas was to assault it.

The night of the 24th was a busy one on both sides. All night long the Confederate signals flashed in sight of both armies, writing their fiery symbols upon the sky. Believ-

in four lines swept over the plain, deploying as they advanced so as to cover three miles of the ridge. Fifty guns poured a shower of shot and shell over all the way. There were many killed, many wounded, but the magnificent wave of battle moved forward. In 15 minutes they have carried the lower line of works and swept over them all along the line. Here they had been ordered to halt for a few minutes' rest, but impatient under a galling fire and elated with success, the men could not be restrained. They seemed determined on winning a victory for themselves. It was 500 yards to the summit. The ascent was broken by ravines, tangled by fallen timbers and huge masses of rock. Spurs jutted from the face of the ridge, serving as natural bastions from which field artillery and riflemen swept the intervening curtains of the slope with an enfilading fire. Bragg deemed his position impregnable, but nothing could check the ardor of the Union troops. They

soft outline of the North Carolina mountains, which, far away to the southeast, blend into the spur of the Rocky Face Range that vanishes southward, leaving the eye resting on a part of the Pigeon Range in Alabama. And this hardly half the horizon. As the visitor faces the town of Chattanooga, encircled from all land approach by lines of forts, batteries and rifle pits, to his rear is the valley of the Chickamauga, where, on the 20th of September, 1863, the sun went down on 30,000 men killed and wounded in the celebrated battle of Chickamauga, where Garfield won his spurs and Thomas displayed his matchless fighting qualities and saved the army. Before him is the valley of the Tennessee, through which flows the tortuous and sluggish waters of the Tennessee river. On the further shore may be seen the land-swell that leads to the Raccoon Range a little way north of Lookout Mountain, that over-brows in stern majesty the whole valley. From the nearer shore stretches a plain covered sparsely with dwarfish-looking trees and warted with knobs and knolls. This plain, clear up the slope to where the observer stands, was the chief theater of the bloody drama that culminated in the storming of Missionary

ing his left wing posted securely on Lookout Mountain, Bragg had, during the night, sent an entire division to strengthen his position on the Ridge. With the faint dawn of light Bragg's expectation of an attack on his right seemed to be about realized, but the real mysteries of the day were veiled by the fog in Lookout Mountain valley. Under that impenetrable curtain Hooker had arranged his lines, and as soon as it was light enough to march the drama of battle opened. How Hooker marched up the mountain, scaled its palisaded crests, is familiar history. In the meantime Sherman was not idle. Before daylight he was in the saddle and his attack was kept up furiously all day. As Sherman's position threatened the right flank of the enemy and their base of supplies, the Confederates moved heavily upon him. Grant was standing on Orchard Knob, from which everything could be seen as in a vast amphitheater. Trustingly relying on Sherman to hold his own on the left, struggling with an overwhelming mass, he waited for the approach of Hooker. The critical moment had come. The thunder-bolt was hurled.

At half-past three o'clock, at a signal of six guns from Orchard Knob, 20,000 men

fired but few shots; it was cold steel they used. Over rocks and logs, on they went. Now they have reached the crest. For a few moments there is a sharp hand-to-hand fight, but the day was won and Bragg and Breckinridge, in person, barely escaped. Sheridan's troops as they came rushing over the summit. At nightfall, Bragg, hotly pursued, was in hurried retreat, leaving Chattanooga, the most important stronghold of the West, in possession of the Union forces.

Last Saturday the panorama of this great strategic and picturesque battle was thrown open to members of the press and other invited guests, chiefly veterans of the war. Gen. O. O. Howard, who had supported Sherman in his futile attempt to turn the Confederate right wing, was present, also General W. L. Elliott, who commanded the Cavalry Corps of the Army of the Cumberland, Col. J. P. Jackson, who was a lively participant in the struggle, and Colonel Lyman Bridges, who fired the signal guns. These gentlemen made short speeches commenting on the realistic fidelity of the battle drama, the topography of the country, and all judges of fine art were struck with admiration at the magnificent scenic effect.

Petaluma Incubator.

This well-known incubator has been in practical use for several years, and each year has grown in popularity as a reliable and efficient machine for hatching eggs. It is not only popular on the Pacific Coast but is in use in the East and a number of foreign countries. From 1881 to 1885 there has been awarded 19 first premiums, among which are three gold medals.

The hatching of eggs by artificial heat has become a profitable business, and the popularity of this system of raising poultry in this State is largely due to the Petaluma incubator. By referring to an advertisement in this issue the merits and simplicity of this machine is more fully set forth.

The Petaluma Courier of last week says it has been shown letters from the managers of three of

the ostrich farms in this State, which prove that the Petaluma is giving the best satisfaction in hatching those large eggs, a most severe test, as the time required to hatch is 42 days.

Horse-Boots and Fixtures.

Mr. J. A. McKerron, for many years, has made this business a special study. A patent boot that he manufactures has been used for several years, and adopted by the leading horsemen in this State. The practical adaptability of these boots has spread abroad and Eastern orders are quite as large as those on the Pacific Coast. He employs a large force of skilled workmen at his factory at 228, 230, and 232 Ellis St., in a special line of horse-fixtures and equipments.

Important to Tree Planters.

One hundred and twenty-five thousand Fruit Trees for sale at a bargain, consisting of Apple, Pear, Peach, Apricot, soft and hard-shell Walnuts; also 2000 Fan-Leaf Palms. Sales will be made in lots, or the Nursery and stock will be sold on the most liberal terms as to price and payments, or will be exchanged for real estate. Inquire of J. M. Hixson, Real Estate Agent, 75 N. Spring street, Los Angeles, or address the proprietor, Milton Thomas, P. O. Box 304, Los Angeles, Cal.

Kitchel's Liniment, Going's, Dixon's, DeBoise's and Standard English Horse Remedies always on hand.

J. A. McKERRON, 228, 230 & 232 Ellis St., San Francisco.

A HEALTHY BOOM!

And a Boom that will know no Reaction!

Will Farmers, Stockmen, Ranchmen, Owners of Fowl, and every person that is interested in our dumb animals, please read the following:

It has been but little over one year since Dr. Fisherman's Carbolyzed Alkaline Lotion was first introduced on the Pacific Coast, and the demand created in that short time is unprecedented; orders are coming from all directions west of the Rocky mountains.

As very little has been done to advertise it, the reputation it has gained has been almost solely on its valuable merits. This Lotion is different from any other liniment ever put on the market, and we boldly claim that its merits cannot be excelled, and as to the point of economy it is many hundred per cent cheaper than any other remedy. To use it once, strictly as per directions, is to use it always. Some of the oldest and best stockmen on the Pacific Coast have discarded all other remedies and use only Carbolyzed Alkaline Lotion. The price is One Dollar for full quarts and Three Dollars for full gallons; as it is to be diluted, one-half with water, it makes just double that quantity of remedy. We guarantee satisfaction in each case or money refunded; we mean this; we have been established in business in San Francisco 21 years, and are here to stay, so we can easily be found.

Please send for copy of our 100 page illustrated book giving truthful testimonials and much other valuable information, which you get free:

This Lotion is recommended for the following ailments, viz.: Sprains, Sores, "New or Old" Bruises, Galls, Swellings, Scratches, Thrush, Grease Heels, Rheumatism. It has no equal for restoring weak knees and ankles to their original condition, Cows' Swelled Udder, Barbed Wire Wounds, Sore Lips, Mouth and Throat, Inflamed Eyelids, Mange, Itch, Skin Disease, etc. Prevents Ear Marks and Brands from becoming fly-blown during the branding season, and it has proved a sure cure for swelled heads and blindness in chickens and fowls; also has proven to cure alkali sores; also a valuable remedy for internal use.

The following is a copy of a letter received from the office of the Hoof and Horn Publishing Co., Prescott, Arizona.

Office of "HOOF AND HORN" Publishing Co.,
PRESCOTT, ARIZONA, July 20, 1887.

Messrs. Lynde & Hough—DEAR SIR: It pleases us to inform you that the Lotion is meeting with a remarkable run and is eagerly sought after by stockmen. Our sample lot was long ago exhausted, but the applications still come in daily for another bottle, so by now it looks as if your remedy would soon be the recipient of a "boom." Many parties have taken the address from our ad. column and will favor you with several orders soon, so they say. What inducement would it be to take the agency here, and what percentage would you give on every dollar's worth of the remedy sold. The sole and exclusive right to the Territory.

Very respectfully,

"HOOF AND HORN" PUBLISHING CO.

ASK YOUR DRUGGIST TO ORDER

DR FISHERMAN'S CARBOLIZED ALKALINE LOTION

For you, or order direct from us. Please give it a trial.

Yours, with respect,

LYNDE & HOUGH,

116 California Street,

San Francisco, Cal.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOEBIG—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Pota h.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly, DR. E. A. SCHNEIDER.

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully, E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1/2 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

We Carry the largest assortment of the latest improved Agricultural Implements on the Pacific Coast; Acme Pulverizing Harrows; Jay Eye See Sulkys and Gangs; J. I. Case Steel and Chilled Iron Plows.

SPECIAL OFFER!

"NEW BECKER" WASHER HAS A REPUTATION.

IT

TAKES THE LEAD.
Why? At last, to Perfection.

BECKER'S LATEST IMPROVEMENT, the Greatest of American Washing Machines. Costs but Little More, and Worth Double any other Machine in the Market.

SENT ON
60 DAYS' TEST TRIAL.

7th Improvement April 1, 1887.

Approaches nearer to the old method of hand-rubbing than any invention yet introduced to the public. EASILY worked, and washes PERFECTLY clean. Owing to its intrinsic merits, thousands have been sold all over the United States, and all giving PERFECT satisfaction. It only needs to be seen and tried to be appreciated. Awarded first premium 1883, 1885 and 1886. In localities where as yet I have NO agent, I will ship sample Machine and Wringer on 60 days' trial, the party to pay for them at WHOLESALE prices and act as Agent, if found satisfactory; IF NOT, return them.

Do not lose money by waiting until SOME ONE ELSE orders samples and secures an agency for your locality. Farmers make \$200 to \$500 during the year. Ladies have great success selling this washer. WRITE AT ONCE for New Illustrated and Descriptive Pamphlet, which contains my liberal proposition. Mention this paper. Call and see me.

25,000 AGENTS WANTED.

E. W. MELVIN, Proprietor and Manufacturer.

OFFICE, 806 J STREET, SACRAMENTO, CAL.

DEWEY & CO., { No. 250 MARKET ST. } PATENT AGENTS.
Elevator 12 Front St.

WARRANTED FIRST-CLASS THROUGHOUT---PRICE, \$130.00.

SOME IMPORTANT POINTS:

Derby Fifth Wheels; Double Collar Inch Steel Axles; Steel Round Edge Tires; Screwed Iron Wheels; Extra Wide Backs; Full Leather Tops 42 inches long; All jobs smoothly finished, and fine, smooth painting throughout.

It is the only Life and Accident Insurance Company transacting business in the United States who a stockholders are by law made liable for the debts of the corporation, and whose directors are made responsible for the acts of its officers.

PROFIT All profits go to its policyholders, none to stockholders, who are limited to the interest earned by the money paid in by them. The Company's investments earn the highest average rate of interest of any Company in the world, and its location is a guarantee that this will be perpetuated, thus assuring the greater dividends to policyholders.

DEATH CLAIMS PAID DURING THE FIRST EIGHT MONTHS OF 1887.

Observe particularly the promptness with which payments follow proofs of deaths. On September 1, 1887, the Company had no unpaid claims on hand.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature. Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours. T indicates trace of rainfall.

Mr. White's Holsteins.

J. H. White of Lakeville, Sonoma county, exhibited 18 head of registered Holstein-Friesian cattle that were much admired, and pronounced by several cattle experts one of the best herds of show cattle ever seen in this State. His importations have been from the most noted strains of the herd book. At the head of his string are Oro Blanco and Lancaster, two-year-old bulls of large size, fine symmetry, and deep black with white points. A span of yearling bulls, Laurin and Huachuca, attracted a good deal of attention from cattle men. In the next stall were Annemie and Winfridalie, four-year-old cows that were models of beauty. Dagodine (a cut and description of whom appeared in the RURAL PRESS last year) was in the next stall with her calf, and has improved with age. The cows Letta, Wayward and Lyle, three-year-olds, are very promising animals. Ocola, two years, and the yearling heifers, Sierra and La Sonite, were much admired. Although Mr. White's cattle were placed at the lower end of the yard they had more visitors than any herd on the ground. During the past year, Mr. White has had a steady and brisk demand for young bulls and heifers, and his success may be attributed to his select importation and judicious breeding. His cattle will be on exhibition at the State Fair and San Joaquin Valley District Association.

From Sonoma County.

EDITORS PRESS:—The first rain of the season has just come to us. For several days there had been threatenings of a shower, but "the oldest inhabitant" said there would be no rain, and consequently the tardy farmer had his grain yet unharmed. However, the damage to grain and hay will amount to but little. The dry feed in pasture will be somewhat damaged. Business in country and town alike is flourishing. An increased demand for property is perceptible, and money is seen changing hands every day.

Hop-pickers are in great demand. Everybody, white, black or copper-colored, who can pick hops can find employment at good wages. Wine-making will soon claim attention. The vintage will be good, better than at first expected. Already some of the white grapes are ready for the cellar.

Our fair city is getting ready for the State Grange meeting. The subordinate Grange is at work preparing for the entertainment of visiting Patrons, of whom there promises to be many. All are invited.

OCCASIONAL.

Santa Rosa, Sept. 6, 1887.

A Good Move.

A surveying party is at work on the Buena Vista rancho near Salinas, consisting of 7000 acres, which will be platted in parcels of from 50 to 500 acres. This whole tract is now offered for sale in subdivisions at one-third cash and the balance in one, two and three years, at eight per cent.

Several large land-holders in Monterey county are making preparations to follow the same plan, which will place on the market some of the most productive land in the State. Monterey county has become noted for an equable and salubrious climate, and the Hotel Del Monte and Pacific Grove Retreat, situated in this county, have become the popular resorts on the Pacific Coast.

The policy adopted by the proprietors of the Buena Vista has given new life and created quite a furore in this staid community. Its adaptability in raising small fruits, and the thermal belt running the entire length of the county, has caused a large inquiry during the last 30 days from persons who wish to plant orchards and build homes. Land in this locality is offered at from \$50 to \$100 per acre in small tracts.

THE LANE & BODLEY CO., Cincinnati, O., established 1850, are the oldest and most extensive manufacturers of engines and sawmills in this country. The excellent quality of their work, fair dealing and liberal use of printers' ink has given their goods a reputation and sale throughout the entire civilized world. We take pleasure in referring our readers to their announcement in another column of this issue.

A Challenge to Fruit Growers.

Citizens of Tehama county have an emphatic way of asserting their belief in the adaptation of their lands. A dispatch from Red Bluff, Sept. 2d, says:

The fruit-growers of Tehama county, Cal., do hereby challenge any portion of the State to compete with them in fruit-growing, for a prize of \$400, to be paid by the losing party. The fruit to consist of ten acres of the following varieties: Oranges, lemons, peaches, nectarines, apricots, prunes, apples, cherries, figs and grapes; trees to be selected by a competent nurseryman for the competing parties and planted in the season of 1887-88, and to be of the same size and age. The prize to be awarded by a committee selected by the competing parties as soon as the trees come into bearing. The challenge will include quantity, quality, size and keeping qualities and earliness of ripening. Parties accepting this challenge will correspond with Dr. Westlake.

HON. H. C. WILSON,
DR. G. W. WESTLAKE,
W. H. BAHNEY,
GEORGE H. FLOURNOY.

Red Bluff, Tehama County, Cal., August 27.

MONTEREY COUNTY LANDS.—Among recent transactions in real estate, we notice that 7665 acres of the Gabalan ranch, belonging to M. Lynn, was bonded last week to a syndicate of California and foreign capitalists through J. C. Hoag of San Francisco for \$240,000, the bond to run 60 days. In the event of the purchase being made, Mr. Lynn agrees to rent the tract the coming year, paying therefor the sum of \$17,000 per annum, the object of this being to close out his farming and dairy interests without sacrifice, he being a large operator.

Over-Worked Women.

For "worn-out," "run-down," debilitated school teachers, milliners, seamstresses, housekeepers, and over-worked women generally, Dr. Pierce's Favorite Prescription is the best of all restorative tonics. It is not a "Cure-all," but admirably fulfills a singleness of purpose, being a most potent specific for all those Chronic Weaknesses and Diseases peculiar to women. It is a powerful, general as well as uterine, tonic and nerve, and imparts vigor and strength to the whole system. It promptly cures weakness of stomach, indigestion, bloating, weak back, nervous prostration, debility and sleeplessness, in either sex. Favorite Prescription is sold by druggists under our positive guarantee. See wrapper around bottle. Price \$1.00 a bottle, or six bottles for \$5.00.

A large treatise on Diseases of Women, profusely illustrated with colored plates and numerous wood-cuts, sent for ten cents in stamps.

Address: WORLD'S DISPENSARY MEDICAL ASSOCIATION, 683 Main Street, Buffalo, N. Y.

"Golden Medical Discovery"—the great blood purifier

Offensive breath vanishes with the use of Dr. Sage's Catarrh Remedy.

GRINDING EGYPTIAN CORN.—Those of our readers who raise Egyptian corn and have trouble and expense in preparing it for feeding will be interested in the advertisement on another page of the Scientific Feedmill, which experience proves will grind Egyptian corn in the head just as it grows, without even the expense of thrashing, and parties using these mills in Fresno and Visalia counties for this purpose speak very highly of the work performed, as also the benefit to their stock from this feed.

PREMIUM ROADSTERS.—J. R. Rose's span of four-year-old roadsters, which took the first premium at the Petaluma Fair, are of the McClellan stock and closely related to the famous Nellie R.

Do you want the best goods at the least cost? If so, send to Weinstock & Lubin, Sacramento, Cal., for their large Fall Catalogue (free). Among other attractions it presents eight pages of finely lithographed Eastern Fashions. Weinstock & Lubin are the largest general retailers on the coast, and in busy seasons fill as high as a thousand mail orders a day.

SOUTH OAK RANCH, ONE AND A HALF MILES from Kelseyville, Lake county; house of 6 rooms; insured for \$600; soil of ranch 60 feet deep; fine for olives, apricots, peaches, prunes and grapes; Lake county produced richest-flavored, highest-flavored and best-keeping fruits at New Orleans World's Fair; this ranch of 160 acres at \$2500 (six acres plowed ready to plant) a great bargain. Address or call on W. L. FOSTER, Kelseyville, Lake county.

A Positive Fact.

Clothes boiled in a suds made from the King of Soaps become white and clean with each successive washing.

THE

PACIFIC RURAL PRESS.

All branches of Farming, including the keeping and breeding of Horses, Cattle, Sheep, Swine, Bees, Poultry, etc.; Garden, Fruit, Vine, Grain, and Hop Culture; Reliable Market Reports, with other important departments devoted to the Grange, Home Circle, News, etc.

It is the Leading Agricultural Home Newspaper and standard authority on all branches of California Agriculture.

It has the fullest and most accurate REPORTS OF HORTICULTURAL MEETINGS, and is the best record of the EXPERIENCE OF INDIVIDUAL FARMERS AND FRUIT-GROWERS in all parts of the State.

Its market reports are prepared with care and the greatest reliability possible for the benefit of the producer.

THE PACIFIC RURAL PRESS has more circulation and influence in the Pacific States and Territories than all the other agricultural weeklies in the United States combined. Advertisers can reach nearly all the leading reading farmers through its columns.

A well-known horticulturist who was in attendance upon the meetings of fruit-growers, writes: "The greatest praise that could be bestowed on the PACIFIC RURAL PRESS at the late Fruit-Growers' Convention, and which shows, undoubtedly, the well-deserved popularity of that paper, is the fact that almost all the members of that Convention were subscribers to the Press."

It is a Farm and Home Journal of the highest class, pure in tone and well informed on all matters of industrial interest. It is handsomely printed and illustrated. It is a 20-page weekly, and is furnished, postage paid, for \$3 per year in advance. Single copies, 10 cents, prepaid.

What Others Say of the "Rural Press."

PROUD OF THE RURAL.—We feel proud of the RURAL PRESS. It is a paper that we are not ashamed to send to our friends in the East. Every farmer on the Pacific Coast should take it, and it is a valuable paper for any one to read. We appreciate your efforts. Long may you live to bless our cause. —James Blood, Santa Barbara Co.

THE RURAL BEST OF ALL.—I take from four to six papers but if I could take but one, I should unhesitatingly choose the PACIFIC RURAL PRESS. —J. M. Asher, San Diego Co.

Established 1870. Yearly subscription \$3. [Thirteen and one-half months are allowed new subscribers and old subscribers paying \$3, strictly in advance.]

AUCTION

—OF—

**Holstein-Friesian
BULLS,
HEIFERS
—AND—
CALVES.**

Owing to the sale to the Hon. LEWIS STANFORD of the land used as a Stock Ranch, we have received orders from Mr. FRANK H. BURKE, of Menlo Park, to

Sell, Without Reserve, All

The Bulls, Heifers and Calves. These animals are all Thoroughbred and registered, and are all from choice prize-winners of deep milk and butter strains. These animals are of choice families, as the Aaggie (the most celebrated in the world); the Netherlands (a great butter tribe); The Menlo (the greatest Holstein Show Cow in the world); The Jacobs (the only imported son of Mercedes, the holder of the milk record of the world); Twisk (holder of the butter record of the United States).

At the same time, and for same account, will be offered

A NUMBER OF GRADE CALVES,

Sired by some of the choicest bulls to be found in the East.

Also, Shropshire Sheep, and Registered Berkshire Swine.

Catalogues can be obtained after Sept. 3d from KILLIP & CO., 22 Montgomery St., San Francisco, or F. H. BURKE, 401 Montgomery St., San Francisco.

SALE

WEDNESDAY, SEPT. 21, 1887,

WHITE SEWING MACHINE COMPANY,
108 & 110 POST ST., S. F.

ZIMMERMAN Fruit Evaporator.

Read Some of the Testimonials.

I have found the Machine (No. 3) very simple, and it does the work to perfection. Parties who have larger Driers of different makes say they cannot turn out superior fruit (apricots and peaches) to mine.
Vacaville, June 12, 1887. I. W. A. GILMORE.

I found the Machine (No. 2) good, and can truly subscribe to all the merits claimed for it. I have sent apples to Santa Rosa and they sold as first-class.
Laguna, July 15, 1887. W. H. J. AITKEN.

Evaporator came safe to hand (No. 3). Have tried apricots with good success.
Stockton Nursery, July 15, 1887. E. C. CLEWES.

Be'ore writing I wanted to test the Drier also on peaches, apples and pears. Am now doing so with the very best results. Upon the whole, I am greatly pleased with the Drier.
(Rev. Dr.) W. ALEXANDER.
Batavia, July 29, 1887.

I am doing fine work with the Drier (No. 3). I bought it in company with Mr. A. J. Lay, and he, after trying it, takes it all. You can refer to me and I will try to sell more.
Glenwood, August 5, 1887. C. C. MARTIN.

I have been using a Zimmerman (No. 3) Evaporator on my apricots this season, and cheerfully attest the fact that its performance is fully up to its promise. Its simplicity is such that, although novices, we have succeeded in turning out admirable work, and its economy and facility are quite remarkable.
August 9, 1887. (Of Kittle & Co., S. F.)

ORANGE, LEMON & LIME TREES

FOR THE SEASON OF 1888.

Having the exclusive Agency of the Pacific Coast for the extensive Nurseries of A. Wimberly and A. J. Beach & Son, of Palatka, Florida, we are prepared to furnish Orange, Lemon and Lime Trees of all the leading varieties (budded on seedling stocks) in any quantity desired, from one tree to ten thousand.

AT PRICES THAT ALL CAN AFFORD TO PLANT.

These Trees are all first-class, 3 feet and upward in height and three-fourths of an inch and over in diameter at base of bud.

It will be necessary to give your order early to secure prompt delivery. Special prices given for carload lots. Write for prices or any information desired. Address

C. W. REED & CO.,

SACRAMENTO, CAL.

ORANGE TREES! ORANGE TREES!

Also **LEMON** and **LIME**, in large or small lots, both wholesale and retail, **CHEAPER THAN EVER BEFORE OFFERED IN THIS MARKET**, of the best known varieties. Our Washington Navels were budded to order, with buds from original trees at Riverside. All other varieties selected by personal inspection; possess the highest excellence and great bearing qualities. They are all budded on the famous sour stock, which is hardier, more vigorous, longer lived and superior in every respect to the sweet stock.

We are prepared to take contracts to plant groves of these trees, and guarantee them to grow. We can also furnish Seedlings in any desired quantity, either Sweet or Sour, at VERY LOW RATES.

Place your orders soon, to secure choice trees at the lowest rates. Send for descriptive circular and price list. Address

W. R. STRONG & CO., Sacramento, Cal.

HORTON & KENNEDY'S

FAMOUS ENTERPRISE

Self-Regulating WINDMILL

Is recognized as THE BEST.

Always gives satisfaction. SIMPLE STRONG and DURABLE in all parts. Solid Wrought-iron Crank Shaft with DOUBLE BEARINGS for the Crank to work in, all turned and run in adjustable babbitted boxes.

Positively Self-Regulating.

With no cone springs, or springs of any kind. No little rods, joints, levers, or anything of the kind to get out of order, as such things do. Mills in use 8 to 12 years in good order now, that have never cost one cent for repairs. All genuine Enterprise Mills for the Pacific Coast trade come only through this agency, and none, whether of the old or latest pattern, are genuine except those bearing the "Enterprise Co." stamp. Look out for this, as inferior mills are being offered with testimonials applied to them which were given for ours. Prices to suit the times. Full particulars free. Best Pumps, Feed Mills, etc., kept in stock. Address,

MERY'S IMPROVED PIONEER

BARLEY CRUSHER

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT.

VALUABLE IMPROVEMENTS HAVE BEEN ADDED THIS YEAR.

This Mill has been in use on this Coast for 6 years, **TAKEN THE PREMIUM AT THE STATE FAIR**

Four years in succession, and has met with general favor, there now being

Over 200 of them in use in California, Nevada & Oregon
 It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

Having used one of the Barley Crushers manufactured by M. L. Mery, of Chico, Butte county, I can say it will do all that is claimed for it, and to those wishing an A No. 1 machine, I would recommend it as the very best I have crushed 35 tons in 11 hours' work.
 J. D. GOLDEN.
 M. L. MERY, Manufacturer, Chico, Cal.

CHICO, CAL., Feb. 1, 1887.
 M. L. Mery, Esq.—DEAR SIR: The 9x14 Barley Crusher bought of you and used in the California Mills, gave entire satisfaction; have crushed 8000 pounds an hour. I have also crushed as much or more on set 10x20 when working for General Bidwell, which set he is using in his mill to-day. Yours truly,
 GEO. SHAND.

ORLAND, CAL., August 5, 1887.
 Mr. M. L. Mery—DEAR SIR: In reply to yours of August 1, 1887, regarding the mill I bought of you, would say that the No. 2 gives perfect satisfaction, and that I can crush from 1000 to 1200 sacks of Barley per day. I will recommend it to the public for good work and lots of it.
 M. C. DILLMAN.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

M. L. MERY,
CHICO IRON WORKS, CHICO, CAL.

 Fifth and Bryant Sts., S. F.

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Park Association, Santa Clara Valley Agricultural Society and Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. The follower has a movement of 26 1/2 inches, the first revolution of the screw moves the follower 1 1/2 ins., the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track.

Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.

Printed Testimonials can be had on application of the following parties, who have brought my press: J. B. J. Portal, San Jose; Wm. Pfeiffer, Guberville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. Stiller, Guberville; Lay Clark & Co., Santa Rosa; Vache Freres, Old San Bernardino; J. F. Crank, San Gabriel; James Finlayson, Healdsburg; P. & J. J. Gobbi, Healdsburg; Wm. Allen, San Gabriel; Wm. Metzger, Santa Rosa; J. Lawrence Watson, Glen Ellen; Walter Phillips, Santa Rosa; Geo. West, Stockton; Eli T. Sheppard, Glen Ellen; Rancho Wine Co., Rancho, Los Angeles Co.; Downing Fruit & Wine Co., Downey; J. L. Beard, Centerville; Wm. Palmtag, Hollister; A. Burnham & Son, Santa Rosa; Paul O. Burns Wine Co., San Jose; E. Emil Meyer, Santa Cruz Mountains, Wright P. O.; Marshall & Hill, Laguna Station; R. J. Northam, Anaheim.

Also manufacture Worth's Patent Hand and Power Grape Stemmers. **W. H. WORTH, Petaluma Foundry and Machine Works, Petaluma, Sonoma Co., Cal.**

1887. THE FARMERS' FRIENDS. 1887.

IMPROVED CHAMPION CIDER MILLS and PRESSES.

THREE SIZES:

Senior, \$40. Medium, \$30. Junior, \$25.

MOST EASILY WORKED.

Built Stronger and Will Last Longer

Than any other Cider Mill manufactured.

THEY HAVE AN ADJUSTABLE THROAT,

Which adapts them to all kinds and sizes of fruit.

THE GRINDING ROLLERS are ADJUSTABLE

They Grind Finer than other Mills.

They are Light, Substantial and Handsomely Finished.

LA DOW JOINTED PULVERIZING HARROW.

Points of Superiority in Which it Excels:

It will do better work.
It is MUCH easier for the team.
It is easier to manage.
It has a LEVER to change the angle.
It is not heavy on the horses' necks.
It has no side-draft.
It leaves no ridge at the center.
It has self-feeding oil cups.

It has a wrought iron frame.
Its chilled bearings cause it to wear longer and work easier.
It is easier to ride.
It conforms to uneven surfaces perfectly.
It can be made rigid if desired.
Its journals are protected from dirt.

Thousands in use, giving entire satisfaction.

PRICE LIST.

No. 12 cuts 6 feet, for 2 horses, has 12 16-inch discs, with weight boxes, FOR VINEYARDS.....	\$ 65 00
No. 16 cuts 10 feet, for 4 horses, has 18 16-inch discs, with weight boxes, 100 00	
No. 17 cuts 15 feet, for 4 horses, has 24 16-inch discs, without weight boxes.....	150 00

PRICES REDUCED!

FANNING MILLS.

JOHNSON & FIELD'S

IMPROVED WHEAT CLEANERS,

BEST IN THE WORLD.

Will clean more wheat in less time than any other Mill manufactured.

Unscrupulous parties are trying to force upon farmers and dealers a worthless imitation of our new Cleaner under a name so similar as to be mistaken for the GENUINE Cleaner.

No. 1. Farm Mills, 24 inches wide.....	\$ 30 00
No. 2. Farm Mills, 30 inches wide.....	40 00
No. 2. Warehouse Mill, 40 inches wide.....	50 00
No. 3. Warehouse Mill, 48 inches wide.....	60 00
No. 2. Separator, without Suction.....	135 00
No. 3. Separator, without Suction.....	160 00
No. 2. Separator, with Suction.....	175 00
No. 3. Separator, with Suction.....	250 00

The Mills are First Class in every particular.

The Superior Grain Drill.

BEST HOE DRILL IN THE MARKET.

Does Better Work and Takes Less Seed per acre than any other kind of Hoe Drill.

Can be worked in trashy and on ground where other kinds will not. Has the best Adjustable Force-Feed in the market, a feed especially adapted to drilling

OATS and BARLEY, WHEAT and RYE, FLAX and MILLET.

IT IS THE CHEAPEST DRILL,

Because it saves and returns more on the investment.

The only Gang that will Turn a Square Corner.

RADLEY'S NEW

Square Corner Sulky and Gang.

REASONS WHY THEY EXCEL ALL OTHERS:

1. They embrace a new principle in construction.
2. They combine lightness and strength.
3. They are extremely compact.
4. They are very light draft.
5. They work equally as well without a pole as with.
6. They turn a corner without strain on the wheels or plow.
7. They are easily operated.
8. They plow level furrows across corn rows.

Don't buy until you have seen them.

We are Agents for David Bradley's Celebrated Garden City Clipper Plows, Harrows and Cultivators. Agents for Calvin Toomey's Truss Axle Sulkys. Send for Catalogue and Circulars.

Manufacturer of
HAY STACKERS, BAKES, THRESHERS, WINDMILLS, PUMPS, HARROWS, ETC.
625 Sixth Street, San Francisco.

PRICE, \$250.

Complete with all the Latest Improvements.

Call and See Them.

All sizes and styles, either for setting in brick, or semi-portable, on skids, with fire-box. PRICES given on application. Address

Automatic Expansion SELF-OILING ENGINES.

I make these Engines in all sizes, carrying usual sizes in stock for prompt delivery. All working parts are inclosed, running in oil, insuring perfect lubrication and requiring less skill and attention than any other.

They are solid, substantial Engines—strictly first class in every respect—developing very high economy, and fully the equal of the best Eastern makes.

CORRESPONDENCE SOLICITED.

"ACME" STACKERS,

"ECLIPSE" STACKERS,
And LOADERS.

LATEST IMPROVED RAKES.

The above shows general design of my larger-sized Stationary Engines. I have patterns for 10x20-inch, 12x20-inch, and 12x24 inch—others under way, and can generally make prompt deliveries.

THE GOVERNOR is an automatic cut-off, controlling a single slide valve by a direct action on the eccentric, and is connected directly to the valve without any complication of rock shaft, tappets, springs, or dashpots. A special point, covered by U. S. Patent, is the driving crank or link, connecting the actuating eccentric to the driving disc, so the governing eccentric may be moved about the shaft within the other eccentric (which drives the valve) by the centrifugal and centripetal action of the weighted arms and springs. The governing force is thus relieved from the strain of moving the valve. I believe this single feature makes this governor superior to any other of its class.

WINDMILLS.

TANKS,
PUMPS, Etc.

Write for Prices.

Parties interested in these machines, and especially those who have land to irrigate or reclaim, are requested to write me, stating fully their probable wants. It costs nothing and may save you money, as I have given the subject careful study for many years, and have spent thousands of dollars developing and perfecting the complete and very economical steam-power pumping outfits I am now offering for sale.

A Place for the Norsemen.

The Norwegian immigrants need not all pile into Wisconsin, simply because it has a climate much like that of their native land—short, warm summers and long, cold winters, with much ice and snow. They might come on to California and find these same, coupled with advantages not to be enjoyed in Wisconsin—localities healthful and fertile, with plenty of wood and water, and winters comfortably rigorous.

It will surprise some to hear us say this, nevertheless we have in California, the most of which may be said to be winterless, districts hyperborean enough, to be the habitat of the Scandinavian and even the Esquimaux. The reason that so little has ever been said about these districts is, that they lie remote and are of comparatively small extent, being hardly larger all told than the State of Connecticut or Massachusetts. They consist of a series of valleys cradled in the High Sierra, mostly in Plumas county, though a few have been dropped along the great Snowy Range further to the south.

Going into these valleys of a winter, scenes such as greet the eye in Northern New England and in Canada open to view. Snow lies to a depth that ought to cheer the heart of the hardy Norseman. There is good sleighing for three or four months every winter, during which time all transportation and travel is done on runners. The houses and the barns, all capacious, are built with a view to warmth. Great fires blaze in the open fireplaces. Into these huge logs having been rolled, are piled with wood, the fires hardly ever being suffered to go out. No need for frugality in the use of wood or lumber here, for the mountains all round are covered with stately forests. The fields are mostly fenced with logs or split rails after the old, old fashion.

The big barns are filled with hay, often pressed to economize space. Great stacks of straw stand outside, for this, too, is carefully saved, being used both to feed and bed the animals. The winters being long, and the snow so deep that there is little browsing for the cattle, much fodder is here necessary. Most of the stock, of which a great deal is kept in these valleys, is housed during the winter. This stock consists mostly of milch cows, great quantities of the finest butter and cheese being made here every year. Enough grain is raised for home consumption and some for shipment abroad. The oats because of its weight brings an extra price in the mining towns of Nevada where most of it is marketed.

For growing the hardier fruits these valleys

cannot be excelled, the apples raised here being especially good. The vegetables, too, are very fine, though to mature these, as well as the grain, irrigation is in most cases necessary. With this aid, enormous crops of both are made certain.

The snow, though it falls to a great depth in these high-lying basins, never drifts badly, nor does the blizzard, so destructive to life and property in Wisconsin and neighboring States, ever go tearing through these beautiful and peaceful valleys. While the winter temperature is low, the cold, because the air is so little stirred, is not severely felt; and what is even

Washington Bartlett.

Monday last, at 5 o'clock P. M., Governor Bartlett closed his earthly career. His death was not unexpected. There has been a whisper ever since his inauguration that his health was failing; that the arduous duties of the gubernatorial office, following close on a warmly contested election, had over-taxed his strength. In May he sought rest and recuperation at Highland Springs; and the symptoms of an insidious disease seemed to disappear. But as he was very feeble and liable to fainting fits it was thought advisable to change his loca-

known, the only extant copy is in the Bancroft library. Under the title is the imprint: San Francisco: Printed by Washington Bartlett, No. 8 Clay street; 1849. He took part in the Vigilance Committee in 1856. In 1859 he was elected County Clerk, and was re-elected in 1861 and in 1867. He filled the vacancy caused by the death of James H. Cutter, on the Board of Harbor Commissioners appointed by Governor Haight. For a brief period he practiced law in partnership with his brother Columbus. Three years he discharged the duties of Secretary of the Chamber of Commerce in this city. In 1873 he was elected to the State Senate on

the Peoples' ticket and voted for United States Senator, Governor Newton Booth. In 1880 he was selected to serve as a Freeholder in framing a new city charter, and in 1882 was elected Mayor on the Democratic ticket, and in 1884 was re-elected. In the Democratic State Convention September, 1886, Washington Bartlett was nominated for Governor, and elected by a majority of 652 votes.

His death is a public bereavement. Few men in official position have been as conscientious and free from partisan bigotry. Only a few weeks before his death, and when the mysterious shadow was deepening around him, he said: "I have always considered my office a sacred trust given me by the people, and that I must

discharge my duty to them without regarding my own personal feelings."

When expostulated with for not dropping the duties of his office and seeking rest, he said: "There was no time when I could do it honorably. If a man accepts a position of trust he must not leave his work. If I had known that the work I had to do would kill me, I should have kept on just the same, for I could not shirk it. I think it has finished me."

A good citizen and able and honest servant of the people has passed to his reward.

THE California Conserving Company has incorporated to preserve and put up for market fruits, etc. Capital stock, \$100,000, divided into 1000 shares. The directors are D. H. Porter, W. S. Newhall and H. E. Hall of San Francisco and Abel W. Porter and Abner S. Hall of Los Angeles, who, together with Daniel Burr, are the incorporators, each taking one share of stock, except Burr, who subscribed for 995 shares.

FAIRS AND AWARDS.—We are obliged to omit this week the publication of several lists of awards which we had prepared, as well as accounts of the Golden Gate, Shasta County and 17th District Fairs, for all which we hope to find space later.

ALFALFA IN ARIZONA—SCENE ON THE CALISTOGA STOCK FARM, IN THE SALT RIVER VALLEY.—See page 229.

more singular, ice never forms to any great thickness. The swift-flowing streams never freeze over. People who come to these valleys to reside, if careful afterward not to expose themselves to an Eastern climate, will probably live to a good old age.

Winterless California is so extensive, and with its many advantages so invites immigration, that we have omitted to speak of these Alpine valleys until reminded that we ought to find, somewhere in this State, homes suitable for these North people, who love to wallow in the snow and to hear the house timbers snap and crack with frost, bringing to mind thoughts and scenes of Fatherland.

PROF. RILEY IN ENGLAND.—Prof. C. V. Riley has been taking part in the meetings of the British Association at Manchester. A cable dispatch says his paper discussing the hop louse "revealed great special knowledge and an intimate acquaintance with the subject." It is gratifying to see his worth, however well known at home, meeting with merited recognition beyond the sea.

THERE are said to be 5260 feet of grain warehouses, 60 feet wide, along the line of the railroad in Salinas valley, and the entire space is piled full of grain. Threshing is nearly done.

tion to Oakland, where he arrived at the residence of a relative, Mrs. Dr. Buckel, in a very weak condition. He grew no better, and Monday, Aug. 22d, it was announced that he had received a stroke of paralysis on the left side. Since then his most sanguine friends have not ventured to hold out the hope of recovery.

Governor Bartlett was born in Savannah, Georgia, February 29, 1824, where he spent his boyhood days. Like thousands of plucky and enterprising young men, he caught the gold fever, and sailed from Charleston in January, 1849, for California. On arriving in San Francisco he found nearly everybody heading for the mines. Young Bartlett resolved to stay in the city and start a newspaper. In January, 1850, in conjunction with John Robbs, he started the *Journal of Commerce*, a daily paper. Bartlett was editor and immediately took an energetic part in furthering the admission of California to the Union. In 1853 Mr. Bartlett and his brother, Columbus, established the *Evening News*. As a journalist he always proved himself an able and untiring supporter of what was just and proper for the welfare of the State and people. It may not be generally known that he published the first book in this city, entitled, "California As It Is and As It May Be—A Guide to the Gold Region." So far as

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

On Maintaining the Territorial Integrity of the State.

EDITORS PRESS:—What you say in a recent number of the PRESS touching the proposed division of California seems to me timely and pertinent. The remark that the men who fixed the present boundaries of this State builded better than they knew is warranted by the facts of history.

I was a resident of California at the time this question of forming a new State and giving shape to its institutions came up to be discussed around the campfires and at the primary assemblages of the people, and can attest that there were two things on which the men of that day had, by a large majority, firmly set their hearts, and these were free soil and plenty of it. It is true, our knowledge of the territory out of which the new commonwealth was to be erected was meager. But what we did not know we guessed at, and, as subsequent events proved, our guesses were not much out of the way.

Without claiming that the incident I am about to relate actually determined the boundaries of California as they now exist, I may say I believe it had something to do with that matter.

About the middle of August, 1849, an informal meeting was held at Sutter's Mill to talk over this business of converting California into a State, a subject that then largely occupied the minds of the older residents; the more recent arrivals, who had by this time begun to be numerous, being, as a general thing, more concerned about getting to work at gold digging than about this question of statehood.

At the meeting referred to there were present perhaps 20 in all, among them being the following, the only names I can now recall: William E. Shannon, then already elected delegate to the Constitutional Convention to assemble at Monterey on the 3d day of September; Clarkson Dey, Charles E. Pickett, William Huefner and the writer. My impression is that Elihu Anthony, now living at Santa Cruz, was also present. About this, however, I am not positive, though I remember he was that summer stopping at the Mill, and that he took an active part in this and all other public affairs.

At this meeting it was unanimously agreed that the organization of a State was desirable, the only problems that seemed to require serious consideration being those relating to boundary and the exclusion of slavery. On the subject of slavery the two principal speakers were Dey and Pickett, the latter advocating the admission of "the peculiar institution" in an impassioned and forcible manner; his opponent, a natural orator and a man of fine parts, speaking with more coolness, but with such effect that when the vote came to be taken Pickett was left without a single supporter, though there were those present who sympathized with his views.

This matter disposed of, the question of designating suitable limits for the new State next claimed attention. For our guidance in this we had only one of Fremont's earlier maps, on which hardly more than a few of the principal rivers and ranges of mountains were laid down. On three sides the limits of California were already fixed; Oregon bounding it on the north, Mexico on the south, and the Pacific ocean on the west, leaving only to be determined how far the new State should be extended toward the east. In this direction the country while under Spanish rule had been supposed to reach to the summit of the Sierra Nevada. Consulting now our skeleton map, it was discovered that the 120° of longitude west from Greenwich would run very near the summit of these mountains. This, besides according with the ancient lines of California, would form a conspicuous, natural and every way suitable boundary on the east. Commencing, therefore, at the Oregon line—the 42° of north latitude, and following this meridian south, it was found that, if extended in that direction, it would strike the ocean shore somewhere in the neighborhood of Santa Barbara and more than a hundred miles before it reached Mexican territory. This would never do, since, besides leaving out a large scope of country recognized as being a part of California, it would bring the new State to a point, giving it an angular and unseemly shape. Moreover, these limits, if adopted, would include an area altogether too circumscribed for what was designed to be the future Empire State of the Pacific.

Traveling south along this meridian, it became necessary, then, to call a halt, which was done when the 39° of north latitude was reached. Here the pioneer State-builder paused, and, surveying the great wilderness stretching away to the southeast, hesitated as to his next objective point. He knew nothing of the resources or the natural landmarks of this vast and desert region. He knew, however, that there was off that way a point where the 35° of north latitude crossed the Colorado river; and for this he struck out, and, having reached it, followed down the middle of that stream to the northern line of Mexico.

A rough map of these outlines of California, as suggested at that meeting, was drafted and

given to Delegate Shannon, who, a few days after, left for San Francisco. On the 2d day of September, 1849, the steamship Panama, Capt. Bailey, left San Francisco for Panama and intermediate ports, taking down to Monterey most of the delegates to the Constitutional Convention, Shannon among the rest. The writer, who was also a passenger on that vessel, being on his way home to New York, well remembers the circumstance of this Sutter Mill map being produced by Shannon and shown to the other delegates, who, on the boundaries as there laid down being explained to them, approved of the same. As these boundaries were so obviously fit and natural, it may well be that they, or something very nearly like them, would, even in the absence of this chart, have been adopted by the convention. In this view of the subject, it is not unlikely that similar, if not identical, lines may at the time have suggested themselves to the minds of other members of the convention.

As now constituted, this State presents a shapely and well-proportioned territory, being of nearly uniform width throughout its entire length of 700 miles, and this notwithstanding the diagonal strike and the great irregularity of its coast line. To preserve it in its integrity should be therefore the pride as it is the interest of every Californian. As the Jewish mother, rather than see her offspring divided with the sword, yielded her claim to its possession, saying, "in nowise slay the child," so would the old-time resident, rather than see California dismembered, say to these malcontents, take the whole, but in nowise destroy the State. "One and indivisible" is a motto that befits California no less than the Union of States.

HENRY DEGROOT.

Napa County Notes.

EDITORS PRESS:—Light, refreshing and welcome showers which visited this valley a day or two prior to Admission Day told us that another fruitful season was drawing to its close.

An early winter, or, to be more exact, early rains that shall usher in the wet season, are expected, and, so far as possible, due preparations for their advent are being made by our thrifty farmers.

Thrashing in this valley finished about the 3d ult., and in other portions of the county at an earlier date. One machine had a successful run of over 60 days—an excellent record for this season. Year by year the area of orchards within our borders increases, and though grain-fields are in the same proportion decreased, still the amount of wheat and barley raised is quite large. The yield of wheat this season was fair; no very large returns are reported, but the quality was excellent. A few of our farmers sold their crop before the market flattened out and realized handsomely, but most of the fields were not thrashed in time for grain-raisers to take advantage of the high prices. In consequence, much is held in storage, all holders being anxious and looking for a firmer market in the near future, or, at least, by next spring. Our barley crop was a good one, though this cereal holds and ever has, in this county, a minor place, wheat being the chief grain raised.

There never was a better hay crop produced in this county than this season, though the yield per acre has, at times, been excellent. The quality of the present crop is superior. Considerable has been sold; much more is stored, as many think prices will appreciate before or during the rainy season. Some of last season's crop yet remains unsold, the crop of '86 being too large to dispose of to advantage.

Our orchards have yielded liberally, and large quantities of fruit have been shipped to S. F. and other points in the State, and to the East. Much has been dried. Greater pains, more interest has been taken in drying fruit this season than ever before throughout the county. New and approved methods have been made use of, the result being that there has been placed on the market some excellent fruit, the equal of that of any section of the State. In Napa City there is a good-sized, well-appointed cannery, built about one year ago. The output last year was in quality excellent, could not be surpassed. This season the cannery has remained closed, and though the valley produces large quantities of superior fruit of most every variety, orchardists had to find a market for the greater portion abroad. It is certain that if some good manager would take hold of this institution another year he could make much money for himself and for the stockholders. While towns in neighboring counties have canneries that put up large quantities of fruit at a profit, it seems a pity Napa should not do as well, for there are few towns in the State that are possessed of as many advantages.

This fact, which has been patent to very many for years past, will be impressed upon many more in the future as our railroad facilities increase. No one can rob Napa City of her river, the traffic upon which is very large. The railroad passing through town and up the valley is one of the best-paying lines in the State, considering its length. But there is room for an additional road, which, in all probability, will soon be built from Napa to Lake county, passing through several smaller fertile valleys on the way. This will mean, of course, much for both counties.

We've had a slight touch of the "boom" that is traveling through the State, and real

estate has appreciated considerably during the last month. This state of affairs is confined to no one section of the county. Considerable farming land has been sold to outside parties, and greater activity is anticipated during the coming winter and spring. Napa's fertile soil and unexcelled climate are factors that will draw hitherward before long a large number of Eastern seekers after congenial homes.

The cool weather that prevailed during the summer has retarded the vintage. The first grapes crushed in the valley were obtained by a cellar in Napa City from Woodland and Davisville. Our own grapes will be ripe for crushing in a week or so, by which time many cellars will have commenced operations. The crop generally is not a full one, not more than two-thirds at the outside. Prices have not been fixed yet, so far as we are able to learn, though many think that rates offered last fall will prevail, i. e., from \$15 to \$25 per ton, according to variety. Several new and substantial cellars have been built this season.

Napa, Sept. 10, 1887.

R.

THE ORNITHOLOGIST.

Defending the Road-Runner.

EDITORS PRESS:—I appear on behalf of the above swift-footed bird to pray that the severe, and as I think unjust, sentence passed upon him by Dr. J. W. Gally of Pajaro township, Santa Cruz county, be nullified. It gave me pleasure to learn, from the letter of your correspondent, that in addition to the many peculiar habits of the creature I seek to defend, he must skip on through life bearing the distinguished Latin name of *Gypsoeranus serpentarius*—or snake-eating Secretary bird—and that the *habitat* of his race is in South Africa as well as on the Pacific Coast.

As a vermin-destroyer, the road-runner fills a most important place in frontier and sparsely settled regions. In Mexico he is much better known and appreciated than anywhere else on our shores. One American friend, who lived for many years in that republic, gives me trustworthy information on the subject. For a long time his little daughter had a pet runner which was quite as tame as any of the domestic fowls. The movements and antics of the bird were described as being extremely comical at times, and he was highly valued for his practically useful qualities. He cleared the house and grounds of rats, gophers, mice, snakes, scorpions, centipedes, tarantulas, vinegar-bugs, and all kinds of smaller vermin, such as crickets, cockroaches, and bugs generally. My friend's Mexican employees often described how the runner killed rattlesnakes, but he did not believe their stories. According to their account, when a snake was found sunning himself, his great enemy looked for a small cactus bush, common in most localities, and breaking off a short branch, which, by reason of its jointed nature, was easily done, he made haste to form an unbroken circle of such branches around his lethargic victim.

When the trap was closed, a sudden peck at the snake set him in motion, and soon there was nothing visible but a writhing ball of hooked pieces of cactus, with the lacerated sufferer inside. My friend was subsequently told by a highly respected land and mine-owner that he himself had seen a rattlesnake killed in that way, and in every respect the statements of the employees were correct.

One of my neighbors here, and a helper, were digging a well last summer a few miles from town. Their camp was visited by a friendly runner, which, being well treated, soon became tame, and stayed near by most of the time. He was continually catching grasshoppers, bugs, and insects of all sorts, and his movements when so engaged were said to be astonishingly rapid. One day he was observed viciously pecking at the center of a tassock of grass, and on later examination it was found that he had killed a tarantula there, but did not make any use of it as food.

In this Territory occasional losses are sustained by cattle swallowing the poisonous "campo mucho." It is a long, slender insect, which, both by shape and color, can be well concealed among rank grass. The good my protegee does by destroying that pest goes far toward counterbalancing his faults and failings. I can afford to admit that he probably kills quail, doves, and small birds, and at times robs their nests, but in the course of a year he very likely destroys hundreds of snakes, most of which, contrary to a common belief, have the power to fascinate birds, and are known to be inveterate robbers of their nests. Men and road-runners ought to be judged, not according to isolated acts in their lives, but rather on the basis of their general habits in relation to the world at large. In this light the snake-destroyer is entitled to protection and ought to be encouraged in his good work, even if he is not a perfect bird. I admit that his killing of three swallows on the 3d day of June, 1887, as recounted by Dr. Gally, was entirely wrong, but I cannot see why he should be denounced as a robber and sneaking pirate for the performance of that feat. As wild deer and antelope have no owner, the hunter who kills them is not a thief; the highwayman, on the other hand, is a robber, because he disregards the rights of property. But who owned the three swallows? Nobody. And since no person was robbed, the bird that

killed them was not a robber. Thus, it will be seen, Dr. Gally's accusation is slanderously unjust. In defense he may declare that in a great farming and fruit-growing State like California the whole community have a proprietary interest in insectivorous birds, and any agency which impairs their usefulness ought to be condemned. That would be sound reasoning, and I accept of it as presented by the doctor, while I must also show that his practice is not in keeping with his theory. He openly proclaims the fact that he owns a 20-acre marsh, where he breeds snakes, toads, lizards, frogs and other vermin. He seems proud of his "natural zoological garden," and tells us of the clouds of gnats, including no doubt mosquitoes and similar pests, which skimmed over his hay-field on a certain day, and brought a flock of swallows there to feast upon them. The legitimate work of these swallows was to kill rural insect pests, which impaired the husbandman's profits; but Dr. Gally, in breeding millions of blood-sucking flies and gnats, which, no doubt, successfully preyed upon farm stock in that neighborhood, so gorged the birds that they were rendered useless in their proper line of service to man.

In respect to the three swallows whose untimely and tragical end threw the doctor's mind into such a feverish whirl, I claim that by logical sequence he ought to be regarded as their slayer himself. He left a miasmatic swamp undrained, bred innumerable insects in its noxious ooze; tempted the swallows to come to a banquet he had prepared for them; kept his domesticated *Gypsoeranus serpentarius* there, bent on mischief; and lo! when the unsuspecting fruit-growers' friends came within four or five feet of the ground, they were dexterously transfixed. What did your correspondent do at the close of that calamitous half-hour? Did he rush to the house for his rifle and lay the guilty miscreant low? Not he. He sat down and wrote his letter for your pages, and, no doubt, found the effort a sort of sedative, particularly as he probably made his conscience believe that all the blame ought to be laid on the feathered offender. As well might tabby be sentenced to death for killing the canary which has escaped from its cage, as that the poor road-runner should be anathematized for obeying his untutored instincts.

Dr. Gally's allusion to "those arbitrary and firm fellow-citizens who seem to be much better and more intimately acquainted with Deity" than himself is an outcrop of his inveterate and arbitrary practice of intruding on every possible occasion his opinions on religious questions. As he appears now to be a see-nothing in entomological matters, I have not the slightest hope of being able to convince him that he is an incomparably worse enemy to the farmers and fruit-growers within a mile or two of his marsh than the agile creature he so bitterly condemns.

The question of the road-runners, condemnation or acquittal, must now be left to the judgment of your readers.

A PROSPECTOR.
Dos Cabezas, Cochise Co., Arizona, Aug. 25, 1887.

HORTICULTURE.

Fall of Blossoms.

The following paper by Rev. M. Ongerth of Alameda was read at the last meeting of the State Horticultural Society:

It happens with stone more frequently than with pip fruit-trees, that they have most abundant blossoms, and yet do not develop any fruit or very little, and seemingly this fact is not subject to any law of nature. And yet in nature's life there are no accidents—nothing inexplicable; everywhere we can see cause and effect.

Man's science has found the way to bend nature's producing power to his will, but at the same time the fruit tree strives first to follow the primordial law of its natural obligation, even if in every other respect it obeys the training hand of man.

The orchardist wants a bountiful harvest of juicy, delicious fruit, but the tree tries to conform to the intention of its Creator, that is, to increase and multiply, by producing seed to its fullest development and ripeness in order to propagate its kind.

To attain his object the orchardist gives the tree a selected place, secures it air, light and sun, and watches its growth, opens and manures the soil, supplies nourishment to its organs. He has so advanced in the science of manipulating the tree that he can force it to produce wood-growth or fruit. But mistakes are very often made, and the orchardist is surprised that nature does not respond in carrying out his intentions.

The tree, in the hand of nature, develops best where soil and condition are the most favorable, and then it maintains its existence in a hard struggle with its surroundings, and at the same time strenuously endeavors to obtain, to secure and to increase the conditions essential to the object of its life.

In this regard man often errs in not properly considering its needs, and then the tree acts precisely as dissatisfied workmen do nowadays—it strikes.

The earnest efforts of the tree are frustrated by the condition of the soil, which has been opened too much, is heated and dried by the sun. The cell connections of the bark on trunk

and branches and the thirsting leaves are also dried up; discouraged, the tree sheds blossom after blossom, and at the season of maturity there is neither juicy fruit nor well-developed seed for reproduction.

The secret how to help the tree in its endeavors is taught us by its growth in a free state of nature and by the way it acts to fulfill its destiny; the secret lies simply in surrounding the bark with refreshing coolness and in sheltering the soil from the burning heat of the sun with adequate vegetation.

Before the stone fruit has developed its sheltering foliage, blossoms appear as the first signs of a rich yield in fruit, but the hot rays of the spring's sun or the north wind which sometimes dries everything up in this country make unmerciful attacks on the abundance of blossoms. And how often these attacks are fatal to the crop the older orchardists know but too well.

An abundant yield of fruit will repay well the cost of labor and material of placing a protecting board or a bundle of straw on the south or southwest side of the trunk and of covering the soil with straw three to five inches high; especially is this the case with the apricot, peach and plum trees.

These same means will insure the maintenance of the fruit on the tree until its maturity.

I said above that the tree's first object is to produce and develop seed, suitable for propagation. He who understands the physiological peculiarities of the seed-kernel, will agree with me that hitherto in California very little consideration has been given to the physiological necessities of the life of the tree, and that here nature does not always produce a sufficiency of the elements of nutriment to promote the development and growth of germ-life.

In the composition of my liquid tree-protector I have taken into consideration the requirements for the development of the seed, for stone as well as seed fruit; its object is not only to protect the tree against the ravages of animal and vegetable parasites, and against the injuries of the weather, but also to assist in the nourishment of the plant, in the production of blossoms and the development of fruit and seed.

[In the discussion which followed the reading of the paper, it was remarked that in all probability the dropping of blossoms is due to several causes; some acting in one case and some in another, and it was doubted whether any specified treatment would meet all adverse conditions.—EDS. PRESS.]

FORESTRY.

Joaquin Miller on Forestry.

NUMBER ONE.

Mr. Joaquin Miller, appointed by Governor Bartlett a delegate to the American Forestry Congress, has decided to contribute for publication in this journal notes of important considerations which he desires to urge upon the attention of the Congress. We are glad to be able to give them to our readers for their consideration and comment:

To my fellow-members of the Congress of American Forestry:

"And the Lord planted a garden eastward in Eden."

Last year I urged, and indeed for a dozen years or more I have urged, that the United States should surrender to each State its remaining timbered lands in order that they might be the better protected from fire and inundations and so on.

And now the Governor of this State has commissioned me to represent California, in part, in the Congress of Forestry to be held the current month at Springfield, Ill. As this little appointment to this very important post came without my knowledge or solicitation of friends, it is fair to presume that there are those in authority who are at least not hostile to my plans for advancing the interests of forestry. And as I may not be able in person to urge the adoption of my plan before the American Congress of Forestry, it may be well to open this series of papers with a brief outline of my methods and reasons for the same.

I believe it is pretty generally conceded that our continent is being washed into the sea by way of the Mississippi and its thousands of miles of tributaries on the one hand, and at the same time swept naked of its native forests by annual fires on the other. I take it that it is this deplorable condition of things that has called into existence the American Congress of Forestry. I spent some time with the late Captain Eads at the mouth of the Father of Waters, inspecting his jetties two years ago.

"We have begun at the wrong end," said this great man more than once to me.

One morning he threw a bucket over the side of the boat and drew up several gallons of dark mud and water.

"There," cried the great engineer, "there is a mixture of one-tenth Missouri, one-tenth Illinois, one-tenth Iowa, one fraction Kentucky, and so on, through about 15

States, with an addition of about five-tenths of pure water."

"And what would you do, Captain Eads, to stop this washing away of States?"

"As I told you," remarked the energetic old man, as he dumped the ugly mixture back into the Gulf of Mexico, "we have begun at the wrong end. But the country is not educated up to the point of beginning. It wants the other end for wheat and corn. It only wants the mouth of the river kept open so as to be able to sell its corn for the present generation, and let the next generation look out for itself. The other end of the river has drowned out this end; State after State is going to be drowned out until some day the coral insect may again build his pretty castles where the people of Iowa are now digging wells for water. The United States is tearing out her very heart with her gang plows, and dumping it into the sea, sir."

I beg to put this statement before the country with something of the emphasis with which this great and good man uttered it there in the mouth of the great river. More than once he brought up the subject and always with an emphasis that would write every syllable in italics.

Captain Eads was very fond of quoting poetry. Once he was saying to himself, "Leaves, leaves, nothing but leaves," when he suddenly turned to me and said: "Do you know that in leaves you can read the history of creation? My son, leaves are not only creation but salvation." I am now writing down his words literally from notes taken at the time.

Captain Eads explained to me that he meant if leaves and grasses were left lying on the ground at the proper time of the year, as nature, the hand of God, placed them, there would never be any damage from high water any time; that leaves would be the salvation of the Republic, and that there would never be any need for Eads' jetties. He explained that he meant when he said that leaves were creation that there is no nourishment so dear to the hungry earth as a handful of leaves. He insisted that more beauty could be grown out of a single basket of leaves than a whole load of manure.

And how are we to preserve the leaves? How are we to use these little reservoirs to hold back the floods? How are we to stay the greed of man and save the land in some measure, at least, from flood and flame?

By beginning as Captain Eads advised, at the proper end. I suppose if man had been his own Creator, he, in his sublime selfishness, would have next created woman. But God first made a garden. She was an after-thought; quite a secondary affair. We ought not to entirely forget this fact.

"And the Lord planted a garden Eastward in Eden."

Some very great, but perhaps not very good man, Bob Ingersoll, I think it was, once remarked that if the Lord had discovered California in time He would have planted His garden Westward instead of Eastward.

But we of California hold with the poet that the East is the West, and the West is the East, and that Eden is ours, all ours. And we mean to try to preserve it, to cherish it, to not be driven out of it by sword, or flood, or flame. We read that about the first real substantial employment that the Lord God was engaged in, after making "the stars also," was that of planting a garden. We know of no pursuit higher than this planting of a garden; except perhaps it may be that of preserving a garden. And to that end the State of California last year voted \$80,000. We are not rich as the older States are. It costs much gold, much strength, to lay the corner-stones of a State three times larger than the great State of New York. California has poured out her money like water. In the early days we declared war with the Modoc Indians, raised men, fought that war through, paid our men, such as would accept pay, and never had a cent of help from the States. We have been doing this sort of thing all the time.

But now at last our land is annually on fire. These fires start on public lands and grow strong there, and then overrun our fields and farms. The farmer can no longer secure an insurance on his ripened grain. We come before the Congress of Forestry with a Bill which is already before the Federal Congress. We invoke the united help of the Nation. This Bill, if made a law, will at least permit us to protect our own grounds and our own gardens, which we have planted Westward "in Eden."

I here beg to submit this Bill, as it now stands before Congress, with the indorsement by joint resolution of the Legislature of California:

A Bill for the Protection of Forest Lands Belonging to the United States and the State of California.

Be it enacted by the Senate and House of Representatives of the United States of America in Con-

gress Assembled, That all Government forest lands in the State of California, not suited to agriculture, on and after the passage of this law, shall be withdrawn from sale and entry, and shall not be alienated from the United States Government. Lands covered with trees or brush, or both, shall be considered forest lands. Such lands shall remain withdrawn until a definitive survey shall have ascertained what portion of such lands should be permanently maintained in forest for the welfare and best interests of the people of the commonwealth.

Officers of the United States Land Department in California shall not allow the sale, or entry, or disposal of any lands in forest not suitable to agriculture. And for the further carrying out of this Act by said officers they are hereby required to demand from all applicants for lands, under any law of the United States in California, that they affirm under oath that the lands which they desire to purchase, to enter, to homestead, or to acquire by any means from the Government, are not in forest, or that at least half of such lands in forest applied for are suitable to agriculture. Two witnesses shall be required to confirm under oath the above statement. The forest lands so reserved shall be placed under the management and control of the Forest Commissioners of California. The Forest Commissioners of California shall have power under this Act to appoint Forest Police and Guardians, and to provide a system for the perpetuation and renewal of forest growth; to mark out such timber as should properly be cut and to sell the same; to regulate pasturage and any occupancy whatever upon the forest lands so reserved; provided, that the said Commissioners turn into the Treasury of the United States all funds received by them for timber, fuel, privilege of pasture, hunting permits, or for any other purpose, over and above the cost of maintenance of said forest lands.

The Forest Commissioners of California, while controlling and managing the forest lands reserved by this Act in the State of California, shall give an annual account to the Secretary of the Interior of the receipts and expenditures for managing the same.

For the purpose of providing foresters and agents to carry out the provisions of this Act, the sum of \$50,000 is hereby appropriated, to be drawn from the Treasury upon the warrant of the State Board of Forestry of California; provided, that should the receipts from said management cover the cost, or any portion of the same, any such excess of receipts, or any portion of the \$50,000 hereby appropriated not needed, shall be turned into the United States Treasury.

The object of this Act is to prevent the waste, the destruction by fire and by other improper means, of the trees and brush on Government lands, and the robbery of timber from the Government forests situated on lands unsuited to agriculture; to provide a reasonable and honorable means of conducting the tan-bark and lumber business in California; to maintain a permanent supply of fuel and lumber by protecting the reproductive power of forests; to secure the climate against extremes of heat and cold and violent winds; and to protect the valleys from torrents and floods; and to provide protection for the watersheds of the springs and streams, so that these shall remain perennial in their flow, for the use of the mines, commerce and agriculture of the State.

This is the bill which California, a land that asks but few favors, has felt compelled to lay before the door of Congress. We have been driven to this by the same vandals that have brought about the devastating and deadly fires of Michigan and other States where forests are being torn down by the greed of wealthy lumbermen, who defy the law and laugh at its agents in Washington.

But for my own part I should have simplified the bill by demanding an absolute surrender to the State of all forest lands not capable of cultivation. Not only that, but I would have the law extend to Michigan, New York, and all the States.

Let us look on this plan a moment. Suppose California and all other States indeed had absolute control of all forest lands, why the State, following the liberal action of the nation, would let the counties have the lands within their lines to protect, to make parks or pleasant resorts, or to erect churches and schoolhouses thereon. The remote border counties that have been impoverished by Indian depredations, fires, and floods, and kept poor by the very conditions of savage, mountains and inaccessible forests, would thus not only be enriched but made at once the protectors of the nation's very heart and vitals. Every county officer, every Constable, aye, every citizen would then have a pride and a personal interest in preserving his property. These woods would then be as secure as the archives or the courthouse of the county. The remote pioneers would no longer assist the depredator to escape punishment and laugh at the Federal officers and law, but he would help to protect the property of children and the heart of the nation.

And so I say, bluntly, that common sense and common justice demand not only that California, but all the States, should have the forest lands not suited to agriculture conceded absolutely and at once by the Federal Government.

There are few forest fires in the old world, because the poor pick up the fallen timber and the leaves are gathered to nourish the earth. But was this the case of old? I rode for a full day, from Babylon toward Jerusalem, without seeing so much as a grasshopper; not a bird, not even a blade of grass in a land that was once an Eden. We read that Alexander the Great planted every tree of Greece there in trying to restore that land, and mourned because the

Greek ivy could not be made to grow on the tower of Babel.

Well, let me tell you right here that in the process of fires and floods—floods that always follow fires—is permitted to go on by the help of ten thousand iron-toothed mills—gang-plows in the valleys to help along the flood that has gathered force in the burned-out higher land—why, we will accomplish that same desolation just as certain as water runs. Only we will achieve by the aid of gang-plow and circular-saw implements, unknown of old, in two centuries what it took Babylon 20 to bring about.

May I beg in conclusion that you do not quite forget what that great and most thoughtful old man, Captain Eads, said about leaves. Leaves are the life of this nation. Every leaf is a little reservoir. Every leaf that is left to lie in its place through the season of floods helps to hold the fort as God purposes. I tell you a single little leaf is of more importance in the glory and perpetuation of this nation than is her stoutest soldier to-day. But surrender the leaves and grasses to the flames and what can poor denuded mother earth do but surrender to the floods and let ruin possess the land?

Yes, we must have fires; but fires in the season. Why, I would rather see a frost in midsummer, I had rather see a cowboy serving at the altar of the High Priest, than contemplate the mutilated way in which we hobble along as a nation in these things.

Our fires must be annual, regular as the spring season; but always in the spring; not always in the summer and fall; never in the summer or fall. Far better have frosts in May.

It was my fate to spend my boyhood with Indians. They were the only true foresters I ever knew. In the spring after the leaves and grasses had served their time and season in holding back the floods and warming and nourishing the earth, then would the old squaws begin to look above for the little dry spot of headland or sunny valley. And as fast as dry spots appeared they would be burned.

In this way the fire was always under control. In this way the fire was always the servant, never the master. And by the time the floods came again there was another coat of grass and leaves stronger and better than the one before, because of the careful and temperate fire of the careful and wise old woman. By this means the Indians always kept their forests open, pure and fruitful, and conflagrations were unknown.

I say, then, let the forests be placed in the hands of those who live in or near them, and have some heart and some interest in their preservation. I say that the life and duration of this nation depend on her walls of wood, more than ever did that of Athens; and I say further, that while we may plant our valleys we MUST preserve our mountains.

Let the few remaining millions of forest lands be conceded to the States, and then on down to counties, and even smaller divisions, school districts for example. And then let the foresters of plain, hard, common sense, follow the Indian's simple method of preserving his property, and my word for it, neither New York, Louisiana, Michigan nor California need fear flood or fire, drought or drowning rains. We would then be getting back near to nature, and nature never betrays her own. Who ever heard of either flood or fire in the Indian's home until the white man came to make it his monopoly?

JOAQUIN MILLER.

Oakland, Cal., Sept. 8, 1887.

SAN FRANCISCO LEMONS.—There is now on exhibition at the Mechanics' Pavilion a sample of seedling lemons grown in the open air at the residence of W. B. Ewer, 1516 Folsom street, San Francisco. The tree upon which these lemons were grown is only seven years old from the seed. The present is its second crop. In addition to those here shown, about fifty ripe lemons have been picked from the tree the past summer, some of them larger than any here shown. The tree has now over one hundred lemons upon it, in every stage of growth from the blossom and fruit just setting—the same as shown in this exhibit. The fruit is very superior, with but few seeds, and of fine flavor. A curious and interesting feature will be noticed of a ripe lemon with a bunch of blossoms growing upon the same stem. The tree has been in constant bloom for over one year.

"VENERABLE PRIEST OF FLORA."—Dr. Asa Gray, who has been spending several months in England and on the European continent, had conferred upon him, in June last, at Cambridge, the degree of Doctor of Science. The public orator expressed a hope that Prof. Gray might be permitted to see the completion of that great work of the Flora of North America, on which he had been so long engaged, and alluded to him as the *flora sacerdos venerabilis* who had reached the seventy-sixth year of his age. "Through all this tract of years wearing the white flower of a blameless life."

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

State Grange.

The next session of the California State Grange will be held in the city of Santa Rosa, the county seat of Sonoma county, commencing at 10 A. M. Tuesday, Oct. 4, 1887. Santa Rosa Grange has engaged Hahman hall, on Fourth street, for the sessions. The hall is on the second floor, large, finely furnished, lighted with gas, and has spacious ante-rooms, closets and committee-rooms. There will be both a piano and organ at the service of the Grange. The hall is in every way well adapted to the use of secret societies, having been built expressly for such purpose.

How to Get to Santa Rosa.

Leave San Francisco, at foot of Clay street, just north of Oakland ferry, via Donahue Broad Gauge. Take steamer Tiburon for Point Tiburon, leaving S. F. at 7:45 A. M., 3:30 P. M. or 5 P. M. for Santa Rosa. Fare to Santa Rosa, \$1.75. Arrangements have been made with the R. R. Company so that the round trip will cost but \$2. Passengers will arrive at Santa Rosa at 10:10 A. M., 6:05 and 7:20 P. M. Committees from Santa Rosa Grange will be at the depot, on arrival of each train, to welcome Patrons and to assist them to hotels.

All the hotels are making special and reduced rates as follows:

SPECIAL HOTEL RATES.

	Per day.
Grand hotel } Single person	\$1.50
and } Occidental	
Two persons in one room, each	1 25
Magnolia house	1 25
Eagle hotel	1 00

Any Patron who may desire rooms, or any information pertaining to the session of the State Grange that is to be obtained at Santa Rosa, can get the same by addressing E. W. Davis, W. M. of Santa Rosa Grange, at Santa Rosa, Sonoma Co., Cal.

Santa Rosa Grange meets every Saturday to confer degrees and to complete the details of State Grange work.

Bennett Valley, Sebastopol, Two Rock and Santa Rosa Granges are working industriously, hand in hand, for the good of the Order, and the Patrons of Sonoma county are determined that, so far as depends on their efforts, the coming session of the State Grange shall be altogether pleasant and successful.

With Santa Rosa's genial climate, good hotels, splendid streets, fine drives, costly dwellings, and noted hospitality, we can assure our readers that it is a good place, and an opportune time to go to the State Grange. Go and work. Go to work, and that for a good cause. We hope to meet all our Grange friends at Santa Rosa the first week in October, 1887.

Literary Exercises at the State Grange.

Members of the State Grange will be pleased to learn that Lieutenant Maxfield, of the U. S. Signal Service, will read a paper at the annual session of the Grange, on "Rain and Frost in California." Lieutenant Maxfield is the Chief Officer of the Pacific Coast division of the Signal Service, and is a resident of San Francisco. It is he who forecasts and predicts the weather of the Pacific Coast. His position is one which has enabled him to gain a vast amount of information relating to the meteorological peculiarities of this coast, and his lecture cannot fail to be of interest and value. We know of no subjects that could be treated of before the State Grange of more pointed interest than these. Farmers should make an effort to be present during the reading of this lecture, as much benefit will be derived.

That portion of the session of the Grange which comprises this literary feature will be open to the general public, so that all farmers, whether members of the Grange or not, will be enabled to listen to Lieutenant Maxfield's remarks.

The Literary Committee have encouragement from several sources which lead them to anticipate a good share of entertainment during the session. They would be pleased to have others who are willing to contribute hand their favors in during the earlier part of the session, when there is more time for literary exercises, without interfering with the other business of the session.

SPEAKS WELL FOR LUGONIA.—We have recently seen statements from places in the southern part of the State that the scale appears to be dying out there, and now comes the *Citrograph*, saying that a worse parasite begins to find the climate unwholesome. "The only saloon East San Bernardino valley has ever had, last week filed its petition in bankruptcy. Liabilities, \$1300; assets, exempt from execution, \$200. The saloon business don't pay here, and the experience of the first one will, we hope, prove such a warning that no other person will ever try it again. We have no use for that kind of a death trap, and the fact of this one going into bankruptcy is evidence that our people do not patronize such an institution."

Going to Santa Rosa.

[An Address to Grangers by Mrs. MARIA B. LANDER.]

"Ben Fisher had finished his harvesting, And he stood by his garden gate, One foot on the rail and one on the ground, As he called to his good wife Kate."

Shall we go to the State Grange? "Can't go!" "Why not?" "Can't afford the expense."

Grangers! do we not nearly all of us recognize these words, or have they not with some become almost stereotyped phrases? However, it may be, as the first week in October, 1887, draws near, this question of going to the State Grange must be answered.

Sisters, how many brothers like unto this "gude man"? Ben Fisher says:

"I know, Kate, our crops aren't the best, But we've labored together to keep things along, And together we'll now take a rest. Frosts blighted the fruit, but Brindle is prime, And Jimmy and Fan are a show."

Your butter and cheese can't be beat in the State, So up to the Grange we will go!"

Thus together do man and wife, daughter and son, take an outing, and human nature, in keeping with that growing nature which the reason of man directs, guides, and in a measure controls, must perforce take a rest; nay, even as the germ-buds safely wrap themselves in thorny or burrow-like coats for winter sleep or rest, so the tiller of the soil and his careworn family bring to light their seedy broadcloths and shiny dresses of well-worn goods, that they may have a little change, get away for a few days from that treadmill of duty in which sometimes

"Their feelings get raspy and cold, For toil never ending and labor uncheered Make women—and men sometimes—scold."

Patrons! have you not labored diligently of late, and have you not, brothers, strong men as you are, come almost to scolding? Of course sisters do not scold—they only fret and worry, and when sorely driven may perchance scowl; but, husband, do you not see that this little fretting and worrying, this everlasting sameness of action, is doing more to make the once girl-face of your helpmate take the lines, furrows and wrinkles of age than has all the number of years of wifehood and motherhood that have been patiently and faithfully, if not always smilingly, given?

Brothers, the good book says beware of vanity; but if many of you would stand before the looking-glass and study for a very few minutes a day the lines that are writing their changes upon your sun-browned faces, you too would see that all work and no play is making of you a dull boy; even as it did the Jack you once so confidently quoted to parents and teachers. [If you would study the reflection there given, you might possibly see that one of your strongest traits was a growing tendency to not only labor yourself from daylight till dark, but that your growing life-buds, your children, also must "make hay while the sun shines;" and as California is noted for her sunny days, almost all days are for labor, and but few hours left for a satisfactory sandwiching of play.

Fathers, as a rule you are the arbiters of all family goings and comings, and if you in reality, as Ben Fisher in poetry, say go, then will the hardness of care from wife's face turn into tearful softness and flashes of the girl-spirit you once knew say:

Ben we will go! There may be stock fatter than ours, Horses swifter of foot, cows finer by far, Better butter and cheese, fruit and flowers; But there's one thing, I claim, that can't be surpassed

In the whole Yankee nation to-day, I would not exchange for a kingdom to boot— That's my gude man.

Surely this frank and perhaps naive confession of the growing old wife will, with her good presence, lead all good husbands to Santa Rosa. This City of Roses says to the Granger: "We are booming, but have in reserve for California farmers a boom of brotherly love and greeting. For our Eastern brothers we have climate to sell, but to the old-gold-hunters, who have turned their spades into scythes and pruning-hooks, we have a royal Grange welcome. Therefore come to the State Grange,

"And gather new feelings, new thoughts and new ways."

If we find those that suit as we roam, And gather up strength in head, heart and hand For the loves and the duties of home."

Grangers! yours is the labor that garners the sunshine and dew for cities and palatial homes, giving it them in no stinted relays of fruits, nuts, berries and grains. Your own barns teem with like stores for your animal subjects, but too many forget that wife, children and self need a rest, change or outing, and it is such we beg—turn over a new leaf and attend the State Grange.

Martinez, Sept. 11, 1887.

DANVILLE GRANGE had a fine meeting and a number of visitors the first Saturday of this month. District Lecturer Loucks assisted in conferring the fourth degree on a class of eight. The ample Harvest Feast was spread in the grove.

ST. HELENA GRANGES, to the number of about five and twenty, surprised their Worthy Overseer Lewelling in his home a few nights since, and stormed his castle in a friendly fashion. Both victors and vanquished passed a happy social evening.

San Jose Letter.

EDITORS PRESS:—Now that the rush of work, taking care of the fruit crop, is easing up a little, our Grangers are beginning to think of their duties to the Order, and if you can once get a Granger awakened to what he conscientiously feels to be his duty, you will almost always find him ready to fulfill it. Last Saturday found the seats in our Grange hall but sparsely filled, yet those who were there came with willing hands to work in the harvest field.

I think almost all the members of San Jose Grange feel a deep interest in the work of the Order, and that the farmers can by united and earnest effort do more to help themselves and to build up a better state of things financially and socially by meeting together once a week in the Grange hall and there discussing the affairs of the farm and interchanging ideas generally.

This summer has been a very trying time for our Grange. The large fruit crop and the great scarcity of help has compelled every one to work early and late until the fruit was saved, and we have been obliged to drop for the time not only the Grange, but all social meetings. Now that our fruit is safe, however, we are ready to enter with renewed interest upon the old familiar and pleasant duties.

Brother Cressey dropped in upon us last Saturday. Said he had, owing to the San Jose boom, sold a piece of real estate, and consequently was enabled to come and pay up his dues. We are always glad to see Brother Cressey enter our hall under any circumstances—his earnest, energetic words bring good cheer every time.

Our little city of San Jose is enjoying a "boom," which seems to express a revival in business and an increase in real estate values.

Our beautiful climate and fine soil are two great factors at work in this boom business, but it has taken the earnest, persevering labor of the farmer to test the producing capacity of the soil; and now, after years of hard, patient work and experiment, he is beginning to reap some reward. May he live long and prosper!

My greatest fear is, that the large prices offered for land will have a tendency to unsettle many families that are just beginning to feel they can take life a little easy. There seems to be no doubt, now that our lovely Santa Clara valley is becoming better known the other side of the Rockies, that the influx of Eastern people will be large, great inducements will be offered our farmers to part with their beautiful places, and many will leave behind their homes it has taken years to make. But then there must always be pioneers in every country, to make the way smooth for men of means. We are glad to have Easterners come and share this heritage we have entered into. We bid them all welcome. There is enough of the good things of this coast for us all.

We are beginning to think and talk of the State Grange, and hope to be of the number who will be present, although we cannot tell what duties may intervene. But at all events, the session cannot pass without being earnestly remembered by San Jose Grange. Fraternally, San Jose, Sept. 14, 1887. N. A. S.

An Enthusiastic Pioneer.

At a meeting of the Pioneers of Alameda and adjacent counties, held in Oakland Admission Day, Brother Erastus Kelsey of North Temescal, who is President of the society, made a brief but eloquent opening address, substantially as follows:

Pioneers and Friends: We have met here this evening to celebrate the anniversary of the admission of California to that galaxy of States, to whose luster her Golden Star added a gleam unrivaled since time began, and gave an impetus to adventure, commerce and civilization before unknown, starting an era of progress, development and liberty which shall tell upon the destinies of the nations.

By her gold, commerce, through all its avenues, has been quickened and expanded. By her cereals the world has been fed.

Pomona has showered gifts upon her in profusion; Flora admires her with a wealth of beauteous flowers; her mountains, crowned with eternal snows, are rich in gold; her beauty of scenery is unrivaled and all known, lowing herds and bleating flocks roam her thousand sunny hills, "her smiling plains laughing to the tickling husbandman," a bounteous crop of waving, golden grain. Her climate, in which it is a pleasure to live and breathe, gives assurance of the prosperity, health and happiness of a people who were culled from the most adventurous, energetic and cultured of our race, in whom all nations shall be blessed.

THE GRIDLEY MONUMENT was unveiled in Rural cemetery, Stockton, with appropriate ceremonies, on Admission Day. The procession included detachments of the military, G. A. R., P. of H., Pioneers, etc. The G. A. R. plat was decked with flowers and bunting. There was a great concourse of people, among them the widow and children of the "mourned hero," and Judge Swinnerton delivered a feeling and eloquent address.

ALHAMBRA GRANGE is to discuss the question of Woman Suffrage to-day, Sept 17th.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

The first State in which members of the Grange have taken formal action in testing the Interstate Commerce law is Vermont. State Master Alpha Messer, representing the State Grange, started the ball in motion by addressing Gov. Ormsbee, calling his attention to the fact that Canadian products are carried over the railroads of the State to Boston and other markets at lower rates of freight than those charged Vermont farmers for a shorter distance. The result has been the State Grange has entered formal complaint against the Central Vermont and other railroads for violation of the Interstate Commerce law. Under the State law the Governor has the power to assign counsel on behalf of the State to assist the Grange in presenting the matter before the Commission, and exercising this right, Gov. Ormsbee has appointed Hon. Kittredge Haskins, who is preparing the case for the State Grange, and U. S. Senator Edmunds will make the argument before the Commission. This will be a test case of the law, and will be watched with much interest. It is encouraging to know that the Governor and the people of the whole State will, with the aid of eminent legal talent, defend her farmers from injustice. That the result will be on the side of justice and right is the hope of all friends of good government.

One of the mistakes that has been made by some Granges is in expecting too much at once. A crop cannot be secured except the ground be carefully prepared, the seed planted, and then weeks and months pass in care and cultivation before the harvest comes around.

"Heaven is not reached at a single bound, But we build the ladder by which we rise From lowly earth to vaulted skies, And we mount to the summit round by round."

All Grange work should be entered upon deliberately, carefully, one thing at a time well done, ever moving onward and upward. It is by well-planned, well-organized work that the Grange to-day is steadily lifting agriculture and its votaries from the ruins of the past and placing it again "at the front."

TEMESCAL GRANGE.—We hope all good Grangers who can attend the meeting of Temescal Grange, of which we spoke last week, will be on hand at 10 A. M. to-day (Saturday). A good time is confidently expected.

REDDING voted, the 1st of the month, on the question of incorporating, and nearly two-thirds of the ballots cast were in favor of the measure.

Santa Clara After the Rain.

EDITORS PRESS:—This county has had a remarkable experience and escape. September 5th and 6th we had rain—some weeks in advance of the usual time. It was unevenly distributed, but enough fell in most localities to have done much damage, had it hung on and tapered off gradually, allowing mold to start on fruits drying and dry feed. Many acres were covered with trays of fruit in all stages of drying. Most of this was piled up the previous night, and such seems not damaged in the least.

Some trays got their full allowance of rain; but oh, this grand redwood of ours! Had it been created on purpose for making trays to dry fruit on, it would have filled the bill exactly. It splits so true and evenly it can be put together almost like sawed lumber. There is so well-defined and firm a grain that air circulates under fruit laid on the shakes, and the least angle given to the tray makes the water run off the side almost as promptly as if no fruit was on it. There is little or no annoyance from gum or pitch, none whatever from warping, and the split shake has no fuzz, like sawed lumber, to stick to the fruit. The redwood is, in the line of trees, a grand development of the eternal power, and deserves to rank in history and song with its cousin, the cedar of Lebanon.

After the rain the sun reassured its reign so promptly with the grand tonic that seemed in every breath of air that nearly every start of mold was promptly killed, though the feed on a few acres sloping to the north may be moldy and the seeds sprouted, and some bales of hay that lay wrong side up may have let the rain in where the sun could not dry it out.

However, the people as a whole are far better prepared for freaks of weather than they were a few years ago. If the joke that "our downcast cousins coming here so freely have brought their weather with them" is true, it is even more true that their careful saving, prudent, look-ahead habits, added to the Californian's native vim, have helped more than their weather has hurt us, and now let us urge and help them to bring their grand daily-bread-earning factories to us. C. A. W.

San Jose, Sept. 12, 1887.

REMEDY FOR FLEAS.—An exchange recommends slacked lime in the stables and sheds where fleas are likely to find a home. Unslacked lime would probably be very good, but there is a possibility of setting fire to the dry trash. Slacked lime, however, gives satisfaction.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

GLANDERS.—Oakland *Enquirer*, Sept. 8: There seems to be an alarming spread of glanders among the horses of Oakland and vicinity, and Sanitary Inspector Snook is on the watch to prevent a general infection. He says that several have been shot privately that have but recently come to his notice, including one at Berkeley yesterday. He has now under his observation two or more cases that exhibit symptoms of the disease. They will be promptly disposed of, in case it is found that they actually have the glanders.

Calaveras.

CALAVERAS GRAPES.—Stockton *Independent*, Sept. 7: U. G. Findley, a farmer residing near Milton, Calaveras county, has sent to this office a fine sample of Muscat grapes grown on the redlands near Milton without irrigation. The fruit is large and luscious.

Fresno.

FAIR AT FRESNO.—*Expositor*, Sept. 7: The Directors of Agricultural District No. 21 have decided to hold a fair here Oct. 4th to 8th during the fall meeting over the fair grounds track. The list of premiums offered is modest, but it is the forerunner of future fairs at which larger premiums and a more comprehensive list of prizes will be awarded.

Inyo.

BANANA MELONS.—Inyo *Independent*, Sept. 10: Last spring Mr. McCarroll sent to Pennsylvania and got the seed of a variety of muskmelon called by the above name. The seed was planted at Mr. Goodale's place, Fish Spring, and have made fine yield. The melons do not at all look like the ordinary muskmelon, but more resemble huge cucumbers. The meat is salmon-colored and of delicious flavor.

SUITED TO ALFALFA.—A year ago last spring Mr. A. O. Collins bought the McCown ranch. By purchase and location he now owns over 1000 acres. A ditch taken from the river conveys water on to all this tract, except less than 20 acres. The soil for the greater part is a light, sandy loam and seems especially adapted to alfalfa. One piece of land was seeded early last spring for the first time with oats and alfalfa. A good start was made, when during the unusual high winds in April the tract was covered with light sand until not a trace of verdure could be seen. The grain made a start through this and was again growing nicely, only to be again buried up. However, water was turned on, and soon, for the third time, both grain and alfalfa were growing. The alfalfa is now thoroughly set and growing rapidly; with the exception of an odd knoll here and there, where the water did not reach, the stand is close, and next season will undoubtedly produce a heavy crop. Another field that looked as though it would have to be reseeded has a fine stand. There are upward of 200 acres now in alfalfa and more will be started next season. The ditch will supply an abundance of water for the entire tract.

Lake.

A MODEL FRUIT-RANCH.—Lakeport *Avalanche*: Geo. Thorington has over 2000 trees, large and small, in a bearing condition. Peaches, prunes, apricots, apples, figs, plums, and in fact every kind of tree fruit that is raised in this vicinity. The trees are all in a healthy and flourishing condition. Our next steps were directed toward the vineyard. Here he has about 20 acres planted to different varieties of grapes; the vines were loaded with fine grapes of various colors. We were taken to the house, where his estimable wife showed us the fruit she had preserved—a tempting display: large peaches that had to be crowded into the jars, prepared whole, looking as fresh as though just off the tree. Mrs. Thorington's preserved fruits are something to be proud of. When George bought this land he paid \$1000 for 155 acres, and with scarcely any help outside his own family he has cleared off a wilderness of trees and brush and converted it into an Eden. This ranch is a proof of what can be done with a little energy and good management. We have in Lake county thousands of acres of equally good land that can be bought at from \$5 to \$25 per acre.

Los Angeles.

CRYSTALLIZED FRUIT.—Pasadena *Union*, Sept. 10: The Fruit Crystallizing Works have used 64,000 pounds of sugar since starting up early in the summer. A considerable force is still employed. Pears, grapes and peaches are now being crystallized. The product will be marketed about October 1st.

Napa.

HOP CROPS.—St. Helena *Star*, Sept. 9: Cole & Simpson have about 20 acres in hops, and upward of 100 Chinamen gathering them. They expect to get through this week. They have a fair average crop. Storey Bros. have 22 acres near Rutherford and seven acres in St. Helena, and report a medium crop. Jas. Dowdell has 14 acres; crop, only medium; picking, progressing favorably. R. F. Lane has 16 acres and a fair crop. He is this year trying the experiment of picking altogether with men and boys, and they are giving satisfaction. The work is done cleaner, better and at less expense than with Chinese, all things considered.

STORING WHEAT.—Register, Sept. 9: Con-

siderable wheat from Napa, Berryessa and contiguous valleys has already been stored in our local warehouses, and wagons loaded with this grain are coming in daily from various points. "I'd like to sell my crop, but I don't care to give it away, as I'd have to do if I sold it at going prices," said a rancher yesterday, "so I'm going to store here in town." Some lots have been sent to Vallejo and Port Costa.

PEERLESS POTATOES.—F. Brughelli has forwarded to the Mechanics' Fair a box of tubers of the Peerless variety. For beauty and for size they cannot be excelled. Some of them weighed upward of two and a half pounds. The contents of the box was taken from only one sack of potatoes. Mr. Brughelli has three acres planted to these vegetables on his ranch below town.

Nevada.

IMPOUNDING WINTER RAINS.—Grass Valley *Union*: Wm. Bree, an enterprising farmer on the lower Colfax road, is constructing a large reservoir in which rain-water will be collected in the winter for the purpose of irrigating his meadow and fruit lands during the summer. By this means he expects to be able to cut at least two crops of clover in a season, and to irrigate as much orchard land as he may devote to that purpose. The reservoir is formed by building an embankment across a valley on the upper end of the ranch. He carried the embankment high enough last season to secure a fair supply of water this season. He is now engaged in building it higher, but does not expect to fill it to its full height until next season, when it will make a lake covering about 30 acres, and furnish a water supply that he can carry to every part of his farm. The embankment forming the breast of the reservoir will be between 200 and 300 feet in length, 60 feet at the base and about 12 feet in height, and is intended to be strong enough to stand permanently. Mr. Bree has figured the matter out to his own satisfaction, and has confidence that he will be well repaid for the outlay in the increased value of his crop.

Placer.

ONE YOUNG RANCH.—Republican, Sept. 7: About two miles from Auburn, on the Sacramento road, H. B. Gaylord has a sloping piece of ground east of the railroad on which he used to mine, but finding that unprofitable he turned his attention to growing fruit and vegetables. Two years ago last spring he cleared off 12 acres under the ditch, devoted a small piece to alfalfa and planted the remainder to an assortment of fruit trees and a market garden. Last year was his first season and he sold \$800 worth of "truck" from the place. This year he has hired one man, but his receipts will amount to nearly \$2000—not a bad result for the second year. It must be remembered that his fruit trees are very young and only a few of them are yet in bearing. Mr. Gaylord has been successful with all kinds of fruit he has tried to grow, and also with every kind of vegetable except cabbage and cauliflower. Others about Auburn have failed with those vegetables, and would be glad if some gardener would tell them what the trouble is.

BEAR RIVER DITCH.—This week laborers are beginning to cut the brush along the Bear river ditch preparatory to cleaning it out and enlarging it. Mr. Birdsall will have a large force at work by October 1st. He says the next year it will bring down at least 1500 inches of water as far as Auburn, possibly 2000 inches.

San Bernardino.

POTATOES PAYING WELL.—Ontario *Record*: Potatoes are found to be a profitable crop at Cucamonga. Mr. Anderson of the Iowa tract has raised six successive crops on six acres. Each has been profitable, but the sixth especially so. After paying all expenses of producing, harvesting and marketing, he cleared \$1500, an average of \$250 per acre. A crop of potatoes occupies the ground a little less than five months, Mr. Anderson having taken three crops off the same ground in 14 months. The potatoes are of such superior quality that Mr. Anderson has a standing order for all he can raise from a Riverside merchant, at 25 cents per sack above market quotations.

Santa Barbara.

LOMPOC MUSTARD.—Record: The mustard crop will not fall much short of the output of last year, but the price seems a trifle lower. Some sales have been made at two and a half cents per pound at our wharf. If our farmers had sufficient foresight to combine and place all their mustard crop with some reliable firm, the highest price possible would be obtained, we believe.

Stanislaus.

ORANGE ORCHARDS.—Modesto *News*: J. H. Prouse's orchard, near Knight's Ferry, contains over 3000 orange trees. About 700 are old trees and are bearing. W. J. Mellor has 500 orange trees in his garden that are one year old. It is his intention to bud them next spring and plant them in a 40-acre tract. City Marshal Hill reports that he has found within the city limits of Modesto 850 orange trees ranging from one to 20 years old. The latter are large, hardy, well-bearing trees and prove that our soil and climate are adapted to the culture of citrus fruit. One gentleman in Modesto has a number of lemon, olive and walnut trees growing, all of which are heavy bearers.

Tulare.

MAST.—Visalia *Times*, Sept. 8: The acorn crop in the foothills this year is stated to be very light. In the valley the crop is heavy

along the streams, but as you leave the water-courses the crop grows lighter until there is none worth mentioning. John Fulgham recently brought to town several branches from an oak tree that were full of acorns. He stated that on an 80-acre tract he has rented east of town there will be acorns enough to fatten 100 head of hogs. But this is a solitary case.

TIMBER CULTURE.—Delta, Sept. 8: One of the few persons perfecting claims to land under the timber-culture law is D. K. Zumwalt of Visalia. He has a fine grove of trees on his claim near Traver, and by the time his eight years (necessary to make good the title) have expired, the law will have been complied with to the letter as it has been to date. This forest will also prove a good investment, as the timber grown on the place will soon be very valuable—the more so that it is in a region where there is no oak timber within a radius of several miles. It will be found necessary before many years to cultivate trees in the valley for fuel, so rapidly are the oak groves disappearing.

FARM AND ORCHARD ITEMS.—The thrashing of alfalfa has commenced. The crop of seed promises to be good in most places.... The wheat crop in the western half of the county, recently thrashed, was lighter than on the east side, where the rainfall was heavier, but it turned out fairly well.... There is a very large amount of grain stacked in the fields in the vicinity of the foothills.... A few farmers have already commenced plowing, to have their ground ready for seeding when the first rains come.... Some fine apples are being brought from foothill orchards. The late apples grown there are much better than those grown in the valley, being firmer and of better flavor. Early apples grown here are not excelled by any.... Strangers in Visalia remark the large number of fine horses to be seen here.... We hear every few days of more parties who are intending to plant olive trees this winter.

NEW PEACH FOR DRYING.—I. H. Thomas has growing in his orchard a new variety of peaches that promises to be a valuable addition to those grown for drying. It is called the Leopold and Walker's Variegated, and was originated in Texas. The fruit is large and contains little or no water. In color it would be called a "pinto," as it is as mottled as a child with the measles. The meat is a nice yellow and mealy. While it is claimed to be originated from the "Indian Blood" or China cling peach, it is a freestone.

ALMONDS AND OLIVES.—Visalia *Times*: District Attorney Lamberson brought in from the Diss ranch, near Jonesa, a sample of olives and almonds grown on that place. The twigs shown are full of fruit and nuts respectively, and settle for all time the question as to whether olives and almonds can be grown in this county.

Yolo.

HOP-HOUSE BURNED.—Woodland *Democrat*, Sept. 8: Tuesday morning the hop-house on Lovdal Bros.' upper ranch—five miles above Sacramento on the Yolo side—was destroyed by fire. The kiln was perhaps the largest in the State, being 100x120 feet, and contained the entire hop crop of 40 acres—about 80,000 lbs. It had been contracted for at 25 cts. per lb. The loss was fully \$30,000; insurance, \$11,000. It is not known how the fire originated. The only explanation is that a Chinaman had dropped a bunch of matches into the green hops while picking, and that the heat in the kiln ignited the lucifers. Hop-men believe that fires in hop-houses occur from this cause more than all others combined, and any person caught smoking in the field is immediately "bounced."

WINDFALLS.—Orchardists suffered no little loss from the severe north wind which prevailed the latter part of last week. Apples, pears, in fact all ripe fruit was blown off the trees, and those who were not prepared to dispose of it right away were unable to save a large portion of it.

Yuba.

STOCK PARADE AT THE FAIR.—Marysville *Appeal*: There were in the procession as it passed before the judges on the quarter stretch, 168 stallions, geldings, and mares, and about 50 yearling and suckling colts. The parade of cattle consisted mainly of Jerseys and Holsteins, with a few grade animals. There were some Polled Angus cattle in the line. In appearance and quality of the stock, farmers and stock-growers generally conceded that the parade was the best that has been seen here for some years. There were nearly 50 head of cattle in the stables that were not taken out, for the reason that they were not halter-broken, and could not safely be herded on the track.

NEVADA.

WILD OATS.—Silver *State*: Wild oats brought from California do well in Paradise valley. We are informed that the oats have almost taken possession of some ranches, and produce a good crop without irrigation. Chas. Singhas has a piece of ground that he is summer following. The field was covered with wild oats, and though plowed in June the oats were not killed. Assessor Riley thinks the oats will grow on any sagebrush land in Nevada, and, if given a good start, will hold their own against summer drouth and winter cold.

GRAIN AND ALFALFA.—Reno *Gazette*, Sept. 6: Many farmers in the vicinity of Lovelock will harvest seven tons of alfalfa to the acre this season. J. H. Thies reports that he will harvest seven tons to the acre. He also re-

ports harvesting 80 bushels of oats, 55 1/2 of wheat and 70 bushels of barley to the acre.

WASHINGTON TERRITORY.

COST OF HOP-RAISING.—E. Meeker, in *Washington Farmer*: Mr. Yates writes me, in regard to the cost of raising hops, that the sum total would amount to 8 1/2 cents per pound, and divides the cost of an acre yielding a ton as follows:

Rent of land.....	\$ 15 00
Setting poles.....	3 00
Training vines.....	2 50
Cultivation.....	10 00
Second training.....	2 50
Picking (one ton).....	85 00
Pulling poles, etc.....	8 00
Team and man hauling.....	4 00
Boss and paymaster.....	4 00
Drying (one ton).....	9 00
Baling.....	3 00
Cloth and twines.....	5 50
Piling poles.....	2 50
Logs on poles (breakage).....	1 00
Wear and tear of building.....	10 00
Insurance.....	2 50
Wear and tear of tools.....	7 00
Delivering to station.....	1 00
Total cost of one ton.....	\$175 00

This is quite an accurate statement of the cost in detail, where the yield is a ton to the acre. We do not average a ton, and, in fact, not over 1600 pounds, taking the whole Territory. I have known two tons to be picked off an acre, and believe I have some that will go that much this year, yet I do not expect an average of more than 1700 pounds. Mr. Yates, upon the whole, is not very wide of the mark. Our off hand standard estimate of cost is nine cents per pound baled, ready for the market.

Answers to Correspondents.

EDITORS PRESS:—In answer to Mrs. V. Hope, I would state that

Asparagus

is very easy to start either from seed or plants, and can be planted at any time during the winter months. Any nurseryman can supply plants, or you may sow seed and transplant the next winter.

Pumping into a Tank.

To "H," Chico, I would say that it is no harder to pump water into the bottom of a tank than over the side at the top, but easier when the tank is only part full, as it saves pumping the water the distance between top of tank and the water level in the tank; and if the tank is full, it saves the friction on the sides of 10 feet of pipe. Put a check valve on the delivery pipe in the tank and then it is all right.—E. LEEDHAM, *Arroyo Grande*, Aug. 29, 1887.

Tehama's Challenge.

EDITORS PRESS:—I see a note in the *RURAL PRESS* of Sept. 10, from Hon. H. C. Wilson and others, challenging any portion of the State to compete with them in the growing of certain specified fruits. Now, if these gentlemen will leave out oranges, lemons and limes, and confine themselves to peaches, apricots, nectarines, plums, prunes and Muscat grapes, I will call them—the winner to donate the prize to some widows and orphans' home. I. H. THOMAS.

Visalia, Sept. 11, 1887.

THE ALLEGRETTI GREEN FRUIT STORAGE COMPANY has incorporated, with the following directors: I. Allegretti, A. T. Hatch, B. M. Lelong, E. F. Niehaus, S. Heywood. I. Allegretti of West Berkeley has been chosen president and manager; A. T. Hatch of Suisun, vice-president, and the Grangers' bank of S. F., treasurer. The secretary is yet to be appointed. The principal office is at San Francisco, but the works are at West Berkeley. Several growers have put in storage fruit to be exhibited at the Mechanics' and State Fairs.

ANOTHER LARGE LAND SALE.—The *Visalia Times* mentions the sale of 40,000 acres in the northern part of Kern county, near Tulare lake. The lands belonged to Moses Hopkins, and the purchase was made by a syndicate composed of James Morton, Tulare; M. Ayres, Los Angeles; M. E. Swarwout, Los Angeles; Carrie M. Green, G. Franger, G. S. Terry and others of Pasadena. The consideration is said to have been close to \$500,000. The final papers were passed and recorded on the second instant.

THE BIENNIAL REPORT OF THE STATE BOARD OF HORTICULTURE, which has been in the hands of the State printer for several months, is now ready for distribution. It makes an octavo volume of 600 pages and contains a number of colored plates. Persons desiring to secure a copy should apply to B. M. Lelong, Sec. State Board of Horticulture, 220 Sutter St., S. F.

THE WILLAMETTE FARMER, after nearly 20 years of useful independent life, has sold its business and good-will to the *Portland Rural Spirit*, in which its owners and managers mean to furnish a good farm journal for the whole Pacific Northwest.

A PARTY OF MEN are at work under County Surveyor Enslow, running the line for the big irrigation canal of the Butte and Yuba Irrigation Company.

Place Your Hand in Mine, Wife.

'Tis five-and-twenty years to-day
Since we were man and wife—
And that's a tidy side, I say,
From anybody's life.
And if we want, in looking back
To feel how time has flown,
There's Jack, you see, our baby Jack,
With whiskers of his own.
Place your hand in mine, wife—
We've loved each other true;
And still, in shade or shine, wife,
There's love to help us through.

It's not been all smooth sailing, wife—
Not always laughing May,
Sometimes it's been a weary strife
To keep the wolf away.
We've had our little tiffs, my dear;
We've often grieved and sighed!
One lad has cost us many a tear,
Our little baby died.
Place your hand in mine, wife—
We've loved each other true;
And still, in shade or shine, wife,
There's love to help us through.

But, wife, your love along the road
Has cheered the roughest spell,
You've borne your half of every load,
And often mine as well.
I've rued full many a foolish thing
Ere well the step was taken;
But, oh! I'd haste to buy the ring
And wed you o'er again.
Place your hand in mine, wife,
We've loved each other true;
And still, in shade or shine, wife,
There's love to help us through.

'Twas you who made me own the hand
That's working all along,
In ways we cannot understand,
Still bringing right from wrong.
You've kept me brave and kept me true,
You've made me trust and pray;
My gentle evening star were you,
That blessed the close of day.
Place your hand in mine, wife,
We've loved each other true;
And still, in shade or shine, wife,
There's love to help us through.

—Frederick Langbridge.

Hammering it in.

Depressed by a severe cold, for which I was indebted to the variable nature of the weather in the last days of November, I sat yesterday morning in a despondent way beside my coffee and dry toast, roasted the soles of my slippers and read away my digestion over the last murder recounted in the *Times*. Suddenly I was startled by the step of a man rushing hurriedly upstairs. The door of my sitting-room was burst open, and my friend Boulder, flourishing in his hand a heavy hammer, stood before me and gasped out: "I've done it at last, Smith! I've done it at last!" Boulder is a most excitable man, with a wife and a large family of boys. I looked aghast for marks of blood upon the hammer, for a trace of human hair in some crack of the handle.

"Which? Who? How many?" I shouted.
"My son, Jack," he declared, "is the cause of it all. He brought it upon me. O, Smith, my dear friend, would you have believed I should ever come to this? Cut me some ham."
He sat down opposite me in an easy-chair, turned up his soles also to the fire, helped himself to a thick slice of bread, and said again:
"Cut me some ham. I must be off to the hills in ten minutes; and it's well to fortify myself, because I may miss my dinner to-day."

"Sir! Mr. Boulder!"
"Let me ring for a cup and saucer. There, now go on with your breakfast and I'll tell you all about it. I was led to it entirely by that hard-headed fellow, David Page!"

"Page?"
"David Page, F. G. S. Hark you! Three weeks ago Mrs. Boulder came to me and said, 'Peter!' I replied, 'Susannah!' She said, 'Look at Jack's clean shirt.' She showed me a shirt folded neatly, with its front covered with red stains and holes and indentations. 'Mercy!' I cried, 'what's the cause of this?' Jack was at school round the corner, you know—Tickleby's day-school. 'I wish to show you, Mr. B.,' said my old girl, 'Jack's linen drawer.' Followed my wife. Looked in the drawer. Found it filled up with stones and dirt. In the drawer below that found clay, sand and old shells in his Sunday jacket. Caused the dirt instantly to be carried to the dusthole. Farther examined drawers in Jack's room, and in the corner of one found a book entitled 'Advanced Text-Book of Geology. Descriptive and Industrial,' by David Page, F. G. S.

"That's what has done it, Peter," Mrs. B. said. "That's the book I've seen him reading evening after evening." "He shall read no more of it," said I. "The book is confiscated."

When Jack came home at dinner-time we had a great disturbance."

Here Boulder gasped over his ham, and I felt painfully nervous. Boulder went on: "'Jack,' said I, 'you shall never more look on that book.' I put it on my own library table. I peeped into it. I looked into it. I read bits of it. I read more of it. I liked it. I studied it. I threw myself heart and soul into it. I comprehended it. I bought a hammer."

Here Boulder caught his hammer up and flourished it again. He was evidently stone mad.

"With this hammer, my boy, I break my way into the treasury of nature."

Here Boulder brought his hammer down and smashed my teacup.

"Ah, good!" he cried, taking a fragment up. "A lucky accident! Look at the crystalline fracture. What's here? Clay. What makes the clay crystalline in its fracture? Fire. Theory of the igneous rocks. Thickness of the ponderable crust of the globe, 800 miles. Depth at which most of the rocks ordinarily found at the surface would exist in a molten state, say five and 20 miles. Undercrust of the globe, granite. Here's a bit."

My excitable friend took from the mantelpiece a handsome paper-weight of polished stone.

"Some ass of a man has polished this fine specimen of primitive rock." With one tap of his hammer, Boulder broke it in two. "Observe," he said, "the exquisite fracture."

"Exquisite! Confound—"

"Never polish a fine specimen. The geologist, my dear boy, is most particular to show you a clean fracture and nothing else. He breaks a stone, and takes pains not so much as to dim with a finger's touch the brilliancy of the broken surface. Now fractures are of various sorts, conchoidal or shell-like, even, uneven, smooth, splintery, hackley. Only look in this beautiful bit of granite at the silvery gleams of the mica and the suety bits of quartz speckling the solid pudding of the felspar. Quartz is of simple minerals one of the hardest. I knock out a little chip of granite, and you will observe that it is impossible to powder the quartz in it by blows of a hammer on the hearthstone. You perceive the hearthstone breaks, but the quartz grains remain uncommuted."

"Mr. Boulder," I began faintly. I was made somewhat weak and helpless by my cold, or I should have met vigor with vigor.

"Pardon me, Smith! They remain, I say, uncommuted. Let me advise you to be a geologist. I am going to the hills to-day on an excursion. Come. Ah! you have a cold. Well, I will stop exactly half an hour." Here he pulled out his watch. "I do want you to share my enjoyment. I do want to make you feel the delight caused by the study of geology. I didn't think that I should take it up myself when I turned out Jack's drawers. Page over-persuaded me. He's just the man to bring the science home to you. Ah! Mrs. Boulder doesn't know it; but I've carried up her spare sheets and blankets into one of the attics, and have a most beautiful experiment on the formation of mud-banks from aqueous deposit in her linen-chest. I've mixed up earth and shells and a shilling's worth of shrimps. In a few days, when I drain the water off, you come over to me, and I'll show you how the top crust of the world is formed, and how the remains of extinct animals get to be mixed with it. Only, if Mrs. B. should by chance go to the chest before the experiment is finished! O, those women! Those women!"

"But now, Smith, as you've got a cold, and can't go to the hills, I'll show you how a geologist need go no farther than his own room for a study of incomparably the most glorious of sciences. I'll give you to-day only an elementary lesson. When I come next, we'll go into the thing more completely. Now, look here!"—down came the hammer on a corner of my mantelpiece—"I break off this little bit of metamorphic rock; the character has been destroyed by polishing; but now, what beauty have I not revealed?"

"Boulder," I cried, "give me your hammer. Let me send your hammer down into the hall."

"Thank you, thank you; I shall be going presently. 'Tis not worth while. Dismiss from your mind what I was just saying about aqueous rocks. Above the igneous you have the metamorphic—you have, to speak familiarly, the mantelpiece upon the paper weight, and not the paper weight upon the mantelpiece."

"I have, have I?"

"To be sure you have. Heat and the pressure of the super-incumbent strata have given to these metamorphic rocks their crystalline appearance, though it is believed that they were once deposited by water, and contained fossils of which all trace has been extinguished. Well, then, Smith, on the top of metamorphic rocks, on the top of the mantelpiece, we place Sir Roderick Murchison."

"Can it be possible?"

"Yes, Murchison and the Silurian rocks defined and discovered by him. They used to be called, along with some others, the Greywacke formation."

"Oh, indeed!"

"Yes. Here we have certain sandstones, shales, limestones, flagstones, and the slates near Bala. By Jove, Smith, you've a slate top to that console table. If it should be Silurian, you happy dog! If it should be Silurian!"

Up leaped my friend, and up leaped I, but not in time to save the chipping of a rather costly bit of furniture.

"Boulder!" I cried, hoarse with rage and

rheum together, "break another piece of furniture, and we are enemies forever!"

"Ah! my boy, you have your enthusiasm yet to come. I'll promise to break nothing of any value. But of what value are these precious polished specimens of yours? Their value's doubled when they show the fracture and the cleavage and that sort of thing. Nay, I'll break nothing more. Well, then, above the Silurian you have the old red sandstone, and then above that, ha!—but it's all fair to break coal—above that the coal."

A heavy lump of coal was suddenly whipped out of the coal-scuttle and being hammered into fragments on the breakfast cloth before I could effectually interfere.

"It is most interesting to search coal for the remains of extinct vegetable life. The markings sometimes are of the most beautiful description. The whole of yesterday I spent in our coal cellar, and a more delightful day I never—"

A loud knock at the street door startled us. Mr. Boulder was picking carefully about the contents of the coal-scuttle, and had spread some choice bits on the rug for further investigation, when a servant appeared to report that Mrs. Boulder wished, if Mr. B. was disengaged, to see him instantly.

"Ah!" said my friend, laying another coal upon the rug, "she has been to the linen press. Smith, go and pacify her."

Hints on the Making of Pocket Money.

[Contributed.]

There are many women in the middle walks of life who find useful ways of spending every cent of money which is brought in by the head of the family, and who are often glad of some means of quietly earning a dollar for "pocket money" now and then to supply themselves with the hundred and one little things a woman finds use for.

Those who live in the country always have eggs and chickens to dispose of and make quite a little in this way, but their less fortunate sisters in town who have not this resource have few ways of supplying themselves with pin money. There is one thing I would suggest, which, though small, it seems to me ought to be successful, and that is the raising and drying of immortelles for florists. There are many beautiful kinds of varied colors, purples, reds, pinks, yellows and whites, and with many different shapes. Their growth requires no care, as they are quite hardy and flourish in any ordinary garden soil, starting quickly and growing in a few weeks to quite a size from seed. They are very prolific, most varieties growing and blooming month after month, giving a fine showing in the garden and producing vast quantities of young flower buds which may be cut and dried. The great trouble in the ordinary dried immortelles, which are often seen, is the late stage of flowering at which they are usually picked. The half or wholly open flower, which looks well on the bush, is useless for drying, as it opens wide and dries a flat, yellow-centered affair, in my eyes by no means a thing of beauty. The flowers should be gathered every day or at least every day or two just in the bud when, having attained their full color or whiteness, they are about to begin opening. Cut them with long stems, tie them in bunches (the stems being kept straight) and hang them by a loop of the string, flowers downward, in a dark place. If hung in the sun or light, not only will they open to a wide, stiff flower, but their bright colors fade.

It will take them some weeks to dry, and even when apparently wholly so, they are not ready for use till the stems are stiff and brittle.

My attention was first called to their usefulness by seeing some of them being used by an ingenious friend of mine who, having more ingenuity than pocket money, was inventing Christmas presents out of nothing, so to speak. She had grown and dried some nicely, and taking some of the then fashionable oval plaques, she arranged the most delicate of the immortelles on them in a loose bunch, stems up, interspersing them with bits of delicate feather-grass and other grasses of the daintier kinds, a few of which she bought at the florist's. Having arranged them as lightly as possible on the plaques, she then fastened them on at the stems with a large bow of flame-colored satin ribbon. The effect was charming. Had she thought of doing it earlier she might easily have sold a number of these at a good price, as not only did a florist, struck with the beauty of the individual flowers, ask to buy some of her immortelles and also those thus arranged, but having left some at a friend's store to be carried home by him to his family for presents, they being laid in the show-case to preserve them, at least a dozen persons inquired the price and wished to buy them inside of a day or so. Since immortelles are so much in demand by florists, it might not be a bad idea for some woman to try raising and drying them. It will have the merit of being an entirely new departure, and is an easy way of earning a dollar once in a while.

EFFECTS OF CIGARETTE SMOKING.—Out of 20 young men who competed for a West Point cadetship at Westfield, Mass., ten were rejected by the physician because they had "the tobacco heart," brought on by cigarette smoking. They were unfit for West Point service.

Which One?

[Original.—By S. C. B.]

Some day, (who knows) with fearful eyes,
Standeth one, by its earthly shrine;
Sadly over the precious dead—
Sending tributes of love divine.
Which one? Not best that we should know;
Ready and waiting, faithful heart,
Pray that our lives each other bless
By word and deed, till "Death us part."

"Death parts!" 'Tis only for awhile,
"Over there" is a "Grand Forever;"
Where we complete earth's woof begun,
In weavings ne'er to sever.
The fabric beautiful is ours,
On Earth, in Heaven, to waste or weave;
Of our free will—we bring defeat,
Or glorious highs achieve.

Homes Versus Houses.

[Written for the RURAL PRESS by JEWELL.]

"Be it ever so humble,
There's no place like home."

I pity that nation whose language has no word signifying "home." No wonder its people are noted for their frivolous external and immoral lives, wholly given up to extraneous amusement and pleasure. They seem to have substituted patriotism, the love of country, for that of home. On the contrary, our German neighbors cling to the home rather than country. They willingly congregate in America, settling down to make home nests for themselves and families, and bring home-customs with them, rearing large families, and making good citizens, virtuous, thrifty and honest. Although Webster makes but little distinction between house and home, yet I see that a home is more than a "covering for protection," it is the place where one lives. Dryden says "Home is the sacred refuge of our life."

How singular the fact that so few houses are truly homes, in the broadest, truest sense of that word. Pass along a city street, with its rows of dwellings, and one can almost feel the difference in the houses, side by side, built exactly alike. What makes that difference, so keenly felt and easily seen?

Do you notice that silent, clean house front, every window closed to keep out the dust and city noise? Even the shades are down too low for a glimpse out into the street. Not a bird nor flower visible, not a child, nor traces of any about? Now, there dwells a proud, selfish man and his family. They use their house as a "covering and shelter," merely. How do I know? Because they apparently care more for appearances than they do for health, comfort and a home, as a generous nature would do. They lose half of God's best gifts by excluding light and air from their house even if they did get dust and noise. The wife and grown-up companions, if they have any, reserve their best for evening amusements—which are purely artificial and wrong—as the darkness is made for rest and sleep, not toil or recreation. Consequently, their lives are filled with duties; even their pleasures taking the form of a duty they owe their "set in society." I have been in houses where everything betokened wealth and culture, but which oppressed me as a tomb. Investigation proved the trouble: the parents were estranged, and the children, of course, were unsatisfactory, as a result of such a union. Harmony must prevail to develop the finest types of humanity.

Let us pause at this house adjoining the other spoken of. See the open blinds and sunshine streaming on the bright carpet; hear the singing birds; note the baby carriage in the hall; and best of all behold the happy mother and children occupying the pleasant room in the house for sitting-room. While the reception-room is that back one, pretty and attractive, but a north one seldom used; a freshness in the atmosphere speaks of outdoor air freely admitted, and the rosy cheeks of mother and children prove the fact. Now this grown daughter finds no desire to go to a nunnery, or run away with the coachman for excitement. Every hour is fully occupied with study, work, and recreation, and the night is given to rest and sleep, except now and then when some fine treat in lecture or concert is indulged in. From such a "home nest" come our model men and women, no matter if it be a cabin or palace. Where the heart is there is the treasure, and only from a home full of peace, love, joy, and duty can high-toned, right-minded men and women graduate.

How few are such homes in our land, and what wonder, then, that our boasted civilization and wealth is a snare and a curse oftentimes! O mothers of our land, do we realize the duties imposed on us? Do we do our best to make our homes what they ought to be, or do we make them the shelter of our boys and girls only, pushing them out of the nest early in life, without ever knowing or feeling the sacred love of a home? Memory carries me back over 40 years, and I again see the dear familiar walls, hung with pictures and bric-a-brac, of those days, most gorgeous to my childish eyes! The rooms seemed deep and high, the staircase long and steep, leading up to the fourth floor, and the merry hours passed there with brother and sisters were delightful, while my parents were models of cheerfulness and beauty in my eyes! Happy childhood, how our added years change even permanent material structures! Years after I visited the old home. Only

a brick house in a narrow street in New York—how small its rooms, low its ceilings and stuffy the atmosphere, while the backyard, once a model of flower beds and grass plat, in my childish eyes a very park to play in! How small and contracted it has become, and how bare of flowers and grass and even room to play in! Well, I am sorry I visited the old home—better have the old childish memory than the later one. It proves, however, that Dryden is right; it is the one "sacred refuge of our life." Thank God for our homes and home memories.

Los Gatos.

A Word to Wives.

(Original.—By F. M. P.)

There are many paragraphs written counseling wives, which apply just as properly and often more to their husbands, and many words of advice or reproof aimed at the women of the family, which should by rights be sent to the men; but there is one subject on which I want to say a word which really may be said to them rather than to their husbands, and in a direction in which I think we women are very apt to be at fault more, perhaps, than they, and that is on the subject of dress at home. There are few men who do not dress neatly to go to their business, and are, therefore, tidy during their home hours, but a woman who is busy all day at work that demands an old dress is very apt to get so tired and "fagged" as to lose ambition about her personal appearance. Don't do it, wives—it pays to look pretty and neat. Fashionable dress is one thing, neat or tidy dress is another and comes within the means of every one to an extent. Granted that the men are neat because they are going out on the street, and have no dirty work to do, still it doesn't alter the fact that they are neat, and that they cannot help feeling the difference between their tidiness and the slovenly dress of the wife, if she be careless. There is no man living, I am almost willing to state it as a fact, who does not notice or feel the difference between careless or natty dress, nor is there any man but likes to see his wife look well at home or abroad. Remember how in those far-off courtship days you used to put on the ribbons he liked best, smooth your hair and look carefully in your glass to see if you were looking your best to meet his eyes. You think he doesn't care now, may be, but he does, cares more than you know, and appreciates it, too, when you look pretty and fresh even more than you imagine. Try and keep up as nearly as possible all those little things which made him admire you when you were a girl. There never was a saying which aroused my ire like the common one, "Oh, my market is made, it doesn't matter." I get righteously indignant every time I hear a woman say that, and more than indignant—sad—for I believe that saying put into practice has ruined more homes, which would otherwise have been happy, than any other one thing. Our market is never made in the sense that we shall relax our desire to please and hold our husbands' love, and the woman who makes light of these little things does so to her cost, as she will some day find.

Society to Encourage Studies at Home.

This society was founded in Boston in 1873, and in 1876 an agency was established in San Francisco. Its purpose is to induce ladies to form the habit of regular and systematic study, in which they are aided by frequent correspondence with teachers eminently fitted to direct their work.

The methods of a course of instruction confined to correspondence are based upon the practice of making memory-notes, and the requirement of abstracts and frequent examinations on topics or books. Each student is treated according to her special needs, there being no classification except by records of individual progress kept by the teachers, and there are no competitive examinations.

There are six courses: History, literature, science, art, French and German. The terms of correspondence are from October 1st to June 1st.

Circulars and further information may be obtained from the secretary of the associates for the Pacific Coast, Mrs. E. B. Barker, 14 Stanley place, San Francisco.

Hen and Kittens.

A while ago a veteran hen on George F. Church's ranch, near Fresno, made up her mind to set. And when a hen makes up her mind to set, says the *Expositor*, she sets. Nothing can equal her in firmness and persistence in that direction, except a man hired to work by the day. The hen usually tries eggs, but if the market price thereof is too high, she does not kick—door-knobs, cymlings or porcelain imitations of hen-results will do, and she will devote herself to incubating them for three weeks and never once let on that she is joking. This was the way with the hen at Mr. Church's.

After some time he concluded to see what her henish had accomplished, so he got a pitchfork and lifted her off the nest, when to his astonishment he found it full of kittens. The hen quarreled and clucked and insisted on gathering her brood of young tabbies under her wings, and taking care of them.

Mr. Church desires some scientific friend to tell if there be anything in the Darwinian theory of the origin of species as to hatching kittens of door-knobs, etc.

YOUNG FOLKS' COLUMN.

The Talking Spoons.

(Original.—By ZILPHA.)

Tinkle, tinkle, tank! The silvery sound comes from a long-closed box in an open closet, and is made by the moving of six tiny silver spoons which have reposed side by side for 12 years, and, having grown tired and becoming suddenly gifted with the magic power of motion and speech, they turn against each other, and one says to the others:

"Are you not tired living such an idle life? I am. Don't you remember what bright times we had before we were shut up in darkness?" Another one replied:

"I, for one, would rather not be thought so much of if I have to be always like this; but still, if we were used as much as by our former mistress, we would not last long. Just think how hard we were thrown, jingling, down, and that twice a week our poor faces were rubbed until they shone, all unmindful of our suffering!" The third one to speak said:

"Yes, I well remember all our pain, but then, how much comfort we took in reposing on the snowy table-spread, and how many admiring glances were cast at our beautiful forms, and how often were flattering remarks made of our polish, to all of which we returned our brightest reflection! What stories of love and hope we silently heard, but not always these, for there were sometimes dark days and troublous times in our household in our younger life. The metal composing us was taken from its ore bed in far-away Mexico, and conveyed to England, and there, amid the smoke of manufactories, we were fashioned into shape, and sold from one merchant to another, were again taken a long voyage across the ocean and at length were owned by a thrifty jeweler in an interior town in New England, from whom we were purchased an age ago for active life."

For a long time the spoons tinkled forth their musical sounds in conversation with each other, but the magic power given them for a brief period ceased to be exerted and all was still, and naught broke the quietude of the room save the slight creaking of the wooden wheels of the ancient clock that stood in the room. Everything has a history, and inanimate nature talks to few, while to the many it is dumb. One of these few heard and knew the language of the spoons, and from it and other sources learned their interesting history, in which the forethought and filial devotion displayed might well be imitated by many in these days.

About the beginning of this century, away in a lovely valley of the Green mountains of Vermont, in the vicinity of Rutland, lived a family by the name of Ruthford, which consisted of parents and two children named Susan and Letha. Their ages at the time written of were nineteen and seventeen years respectively. Luxuries in the line of dress at that early day were comparatively unknown among those mountain dwellers, and to these girls a bow of ribbon and a few yards of lace (which had been their mother's maiden possessions) was a treasure fondly cherished and as carefully guarded as misers do their hoarded gold.

Youth, health and beauty need very little to enhance their charms, and the girls were rich in all of these. Loving their father, they idolized their mother, and sought in every way to render her happy. She had long cherished the wish to be the possessor of a set of silver spoons, but there seemed no likelihood of its fulfillment and so never expressed this desire, yet her daughters instinctively felt and knew of its existence. Many a time they secretly conversed about it, and thought and discussed vain plans by which they could get the coveted treasures. No way seemed to open to them by which they could earn the amount necessary to purchase the spoons, for in those days they cost much money, and that being a very scarce article, almost all transactions were by barter and trade. After weeks and months of thinking on the subject of "spoons," their father came into the kitchen one day and announced that eight little pigs had just been born in the pen close by. Hastily all sallied out to the sty and Letha's quick eye and active brain at once perceived that those little pigs would in time become full grown and might possibly be disposed so as to secure the spoons.

During the day she and Susan discussed the matter, and, forming their plans, asked their father to give them "two of the tiny pigs to have for their very own," and in return offered to feed and care for all of them. Vainly seeking to learn their object, he agreed to their offer, and during the weeks and months that followed, the sisters impartially but faithfully cared for the rapid-growing pigs. At last they were big and fat enough for sale, but the nearest market was 40 miles away over the mountains to Montpelier, and, as their father could not drive them there, the two girls knew that they must do so if they would accomplish their object. Brave, tender-hearted Letha almost despaired at the thought of such a journey, but, taking their father into their confidence, he reluctantly consented to their departure and all united in securing the consent of the mother, who was kept in ignorance of the intended outcome of the trip. So one bright and frosty morning in autumn the girls bade their parents a tearful good-by, and, driving the pigs before

them, started on their journey. Onward they slowly toiled over the mountains, down through narrow valleys, crossed sparkling brooks and rested beside huge trees by the roadway. The country was sparsely settled, and their journey slow, so at nighttimes they sought needed repose and welcome shelter in the humble log-cabins of the hardy settlers, who gladly cared for their animals as well as themselves. Footsore and weary, they finally reached the town where a kind-hearted blacksmith turned their pigs into a pen while they sought a purchaser. After several hours they succeeded in finding a jeweler who would trade solid silver spoons for the swine. The bartering articles were mutually examined and the spoons finally chosen from a limited assortment, and, to the weary but happy sisters, how beautiful they looked; how they shone in their silvery brightness, and they thought them incomparable in their loveliness! Soon their mother's initials were engraved on their brilliant surfaces, and gleefully they started on their homeward journey. What minded they fatigue? The radiant face of their beloved mother, and their father's grave smile, rose before them, and they imagined how each would enjoy their tea with such spoons, and that the golden, delicious maple sugar would taste finer, coming in contact with the silver beauties; their steps grew faster and hearts beat lighter at their mental picture. Again they crossed the babbling brook, but its words were sweeter than before; the mountains appeared more green, the sky more blue and every falling leaf in its rustling seemed to sound a mother's benediction. Miles grew less and less, and at length, as the lightening shadows of evening fell, they, footsore and travel-stained, crossed the familiar threshold and were welcomed with fond embraces and loving words. Letha took from her pocket an oblong box, and, opening it, displayed to the surprised mother the shining treasures therein contained. How that mother admired the gift obtained by the laborious efforts of her loved daughters none ever knew; but no happier girls could be found in all the Green mountains than Susan and Letha; and when, in the course of time, the loved mother passed peacefully away, her surviving daughter inherited the spoons, so well and bravely earned by her in maidenhood, and from her they have been handed down from one generation to another, until now they are in the happy possession of the writer of this true history.

GOOD HEALTH.

Philosophy of Longevity.

There is much in modern life that tends to shorten existence and to diminish the probability that a man or woman will reach 90, to say nothing of a hundred. We lead more exciting and wearing lives. It is vain that a person has a splendid constitution to begin with, wears flannel, or the equivalent of flannel, next to his skin; dwells in a warm, dry house, and eats and drinks everything that is good and wholesome, if at the same time he habitually overtaxes his strength, looks upon his muscles as mere machinery to be driven at high pressure, and ruthlessly calls upon his nerves to squander their reserve power when every other source of energy is exhausted. Men or women who intend to be centenarians in these days must combine something of the old mode of life with something of the new mode of living. They must, while availing themselves of all the scientific discoveries and sanitary appliances of the age, imitate their grandsires in the steady and tranquil habits that prevailed before the invention of locomotives and the telegraph. They must have their eight hours of sleep regularly; they must have intervals of repose and vacancy in the daytime; they must spend a goodly portion of their waking hours in the open air. Nor will that suffice; there will have to be regularity in the hours of their meals, and discipline in the ordering of the dishes of which the meals are composed. We cannot believe that anybody will ever live to 100 who eats a heavy dinner every night of his life at eight o'clock. Champagne in abundance, and Bordeaux or Burgundy *ad libitum*, should be forsworn by persons who deliberately set before them the attaining of their hundredth birthday. Neither, with such an end in view, would the active life of a politician, a lawyer, or a doctor be a sane enterprise. In order to reach that distant goal there must be a training, if not severe, at least regular and unflinching. Most of all there must prevail in the existence of such a person a tranquil serenity, an unruffled calm. Neither generous passions nor enthusiastic ideals must be allowed admittance. The pulse must never be driven up beyond a certain point, either by work, by anxiety, by fear, or by hope. At the same time, mere stagnation will, in all probability, never enable a person to live to 100. There is such a thing as rusting out as well as wearing out. If a candle does not burn brightly enough, it does not consume the wax with rapidity, and goes out for want of adequate combustion. It is so, no doubt, with the human body and the human spirit.—*London Standard*.

THE BEST TIME TO BATHE.—It is best to bathe just before going to bed, as any danger of catching cold is thus avoided and the complexion is improved by keeping warm for sev-

eral hours after leaving the bath. A couple of pounds of bran put into a thin bag and in the bath-tub is excellent for softening skin. It should be left to soak in a small quantity of water several hours before being used. The internal aids to the clear complexion are most of them well known, and the present season is the best for a thorough cleansing and purifying of the blood. The old-fashioned remedy of sulphur and molasses is considered among the best. Charcoal powdered and taken with water is said to be excellent, but it is most difficult to take. A strictly vegetable and fruit diet is followed by many for one to two weeks.—*London Lancet*.

THE MEDICINAL PROPERTIES OF VEGETABLES, ETC.—Spinach is believed to act as a stimulant on the kidneys. Dandelion as a tonic and laxative. Asparagus as a blood cleaner. Tomatoes is attributed a special action on the liver. Beets and turnips are said to be tonics. The red onion a nerve of some value in sleeplessness and neuralgia.

DOMESTIC ECONOMY.

BOILED FLOUR.—The boiled bowl of flour should be in every housewife's store-closet at this season, for it will cure bowel disturbances without medicine. In a stout muslin bag tie up a large coffee-cupful of flour, leaving a little room for it to swell. Drop into a pot of cold water, place on the fire and let it boil steadily four hours. Turn out the flour ball and let it dry all day in the hot sun. Grate a tablespoonful of this wet with a little cold water, and mix in a cup of boiling milk and water, seasoned with salt. It is very nice food.

DRESSING FOR SLICED TOMATOES.—Beat two eggs well together, add one teaspoonful sugar, one-fourth of a teaspoonful of salt, the same of prepared mustard, one tablespoonful of sweet cream and three tablespoonfuls of vinegar. Place the bowl containing it in a basin of boiling water and stir till about the thickness of cream. It will take above five minutes if the bowl is thick and the water boils at the time. Cool and use as needed.

GINGER COOKIES.—Two teacupfuls molasses, a teacupful each of butter and sugar, two teaspoonfuls each of ginger and cinnamon, three teaspoonfuls soda, half cup boiling water, and alum the size of half a hazelnut. Dissolve the alum and soda in the hot water, then add the other ingredients and sufficient flour to roll out without sticking. They should be somewhat thicker than ginger snaps. Bake in a hot oven.

PRESERVED APPLES.—Pare and core 12 large apples; cut each into eighths; make a syrup of one pound of sugar and one-half a pint of water and boil; put in as much apple as can be cooked without breaking; remove them carefully when tender; after all are done, add to the liquid one cup of sugar and boil 10 minutes slowly; flavor with lemon and pour over the apples, or grate nutmeg on them instead.

GRAPE MARMALADE—AMBER COLOR.—Separate the skins and pulp of the grapes and cook the pulps until the seeds separate, strain it, and to four quarts of pulp add two quarts of sour apples, measured after cooking, the grated rind of three good lemons, and nine pounds of sugar; let it get hot before the sugar is put in, and cook for half an hour after it begins to boil.

ORANGE CAKE.—One egg, one cup of sugar, 1½ cups of flour, one-half cup of milk, small piece of butter, two teaspoonfuls cream of tartar, one teaspoonful of soda. This makes three cakes. For icing use white of one egg, juice and grated rind of one orange and a little sugar. Lay between the cakes.

WALNUT CAKE.—One cup of sugar, nearly one-half cup butter, 1½ cups of flour, one-half cup of cold water, two eggs, one-half teaspoonful of soda, one teaspoonful of cream of tartar, one-half pound of walnuts. Cut the nuts into fine pieces. Frost the cake and put whole nuts on top.

APPLE JAM.—Select nice winter apples (Spitzenburgs are the best), pare, core and chop; make a syrup of the same quantity of sugar, a fresh lemon and fresh white ginger, not shredded fine, add apples and boil until the fruit looks clear and yellow. This can be canned or not.

SCOTCH SHORT BREAD.—Two pounds flour, one pound butter, one-fourth pound sugar; roll the sugar and mix in the dry flour, boil the butter and stir it in the flour and sugar. When mixed let it stand two hours before baking; prick it well and put on caraway comfits or citron.

SOFT GINGERBREAD.—One egg, one cup of brown sugar, one-half cup of molasses, one-half tablespoonful of butter, one-half cup of sour cream, one-half teaspoonful of soda, one teaspoonful of ginger, flour enough to stiffen. Bake in a moderate oven.

PUFFET.—One quart of sifted flour, in which mix thoroughly two teaspoonfuls of good baking powder, butter the size of an egg, two teaspoonfuls of powdered sugar, two eggs well beaten, mix very smooth and add one pint of sweet milk; bake immediately.

TOMATO SALAD.—Peel ripe tomatoes with a sharp knife, slice crosswise, lay in a salad bowl and season on the table with salt, a little sugar, pepper, oil and vinegar. Keep the tomatoes on ice until actually served. They cannot be too cold.

The Week.

The autumnal fairs are now in mid career. Last week witnessed the successful run and close of those at Redding and Grass Valley, and this week the Oregon State and Los Angeles Pomological, as well as our own State Fair at Sacramento, are auspiciously opened, while the Mechanics' Institute, as elsewhere noticed, goes on prosperously. Next week there will be a brief breathing spell, and then the beneficent epidemic breaks forth afresh in many places.

Governor Waterman.

Robert W. Waterman, who succeeds to the executive chair made vacant by the death of Gov. Bartlett, is a native of the State of New York, but spent his boyhood in Illinois. He visited California in 1850, and came hither in 1860 to stay, purchasing a ranch in San Bernardino county, where he devotes much attention to stock-raising. His mining enterprises in what is now the Calico district, however, appear to have yielded him most profit.

Elected last year Lieutenant-Governor by 2500 votes over his Democratic opponent, W. F. Tarpey, he enters upon the gubernatorial office under peculiar and trying circumstances. But although inexperienced in administering public affairs, he is a man of such devotion to what he deems the right, and so conservative in his principles, that he should have the sympathy and support of all good citizens in his endeavors to steer aright the ship of State.

Gov. Waterman has an intelligent and amiable wife and a charming family, well fitted to grace the executive mansion of California.

California Great in Almost All Things.

From the much that our home press has been saying lately in praise of California, it is greatly to be feared that people abroad will begin to think we are sadly given to self-laudation. If to tell the simple truth with some iteration and a spice of enthusiasm may be construed into vaunting, then are we amenable to the charge. But the fact is we have ourselves been taken partly by surprise. Not until recently did we ourselves fully appreciate or even understand the many advantages that pertain to California; and if now, having discovered so much that is new, we talk with more assurance than to others may appear seemly, this is but natural and should be overlooked. Having through ignorance of its resources failed for so many years to duly advertise the State, it is proper enough that we seek now to make up for lost time.

But in all we have said in praise of California we have nothing to take back and not much to qualify. It is really a great State—great in extent and great in its wealth-producing and population-sustaining capabilities.

And first of its area. Place the noble old commonwealth of Massachusetts in the center of this State, and surround it with a cordon of the smaller sisters of the Union, and the margin left will convey some idea of the magnitude of California. With its resources but moderately developed, this State would be capable of sustaining 10,000,000, perhaps even 20,000,000 inhabitants instead of the 1,000,000 or a little more that now inhabit it, but which number is bound to be rapidly increased. If its population is comparatively small, let it be remembered that more than half the people who came here during the first decade of its existence went away again, having enriched themselves from its mines, and thus accomplished the object of their visit. Nor is California a very old member of the Union, having just completed the 37th year of her statehood.

As California is territorially large, so are many of her industries large, as well as much besides that pertains to her. She produces more gold, wheat and quicksilver, and contains within her borders more valuable salines, has more quartz-mills, large reservoirs and water ditches, than any other country in the world. She contains also as many miles of railroad in proportion to her population as any other. She makes more wine and raises than any other State in the Union, while in the matter of wool and barley she takes no lower than a second rank. In the size of her wheatfields and vineyards, hotels and dairies, she has probably no compeer. The soil of California is prolific beyond example. Its excellence renders it probable that our ideas in regard to the locality of the original Garden of Eden have all been wrong. Even the brute creation shows here a marvelous fecundity; as did the political rounder vote, so do our sheep and kine bear "early and often."

As for the healthfulness of our climate, if only Ponce de Leon, when in search of the Fountain of Perpetual Youth, instead of floundering about in the swamps of Florida, had come this far west, he would have found the object of his search as nearly as it ever will be found on earth.

Coming back to big things, it may be said that California contains the biggest trees and the most of them; the highest waterfalls, the grandest canyons, and, with one exception, the loftiest mountains in the United States. She can also boast of having the most extensive dry and barren deserts on the continent, there being thousands of acres in Death valley on which a horned toad cannot live, because of its heat and aridity. We will not affirm that our rattlesnakes exceed all others in size, but the reptile with us is sufficiently large for all practical uses. Men grow large on this side of the Sierra Nevada. A majority of the women, if not extra large, are good looking—and they nearly all belong to the majority, certainly the most of them!

Then this imperial State of ours has some things that are peculiar to herself. Here only grows the redwood, most useful and noble of trees; here only is found the grizzly bear, most powerful and ferocious of beasts; and here alone do the "Dead rivers" proper occur.

Californians are fond of doing things on a large scale. We farm and mine, make lumber, speculate and gamble in that way. Our quartz-

mills are noted for the number of stamps they carry. Our drift mines excel all others in the amount of gold taken out, while the hydraulic operations prosecuted here dwarf those carried on in other countries. Even our amusements are of the heroic and expansive kind. If we wish to engage in the pastime of sliding down hill, we do not build the puny toboggan, as in the East, but climb the snow-incrusted mountain to the height of 1000 feet or more, and speed down its side on the Norwegian snow-shoe with almost lightning rapidity. Here is sport worthy the Californian!

But not in all respects does California take the lead; not in everything is she distinguished above all other countries. When it comes to earthquakes, cyclones, sun-strokes and the deadly lightning, to epidemics, drouths and floods, she is obliged to lower her standard. As a meteorological extremist, California is a failure, if it is ourselves that have to make the humiliating confession!

Glimpses in the Pavilion.

The Mechanics' Fair this season is a very marked success. More exhibits have been put in place since our last issue, and the attendance is highly gratifying to all concerned. Last Saturday, it is reported, the sales of single admission tickets numbered more than 4000, and in the evening the crowd came quite as near being a crush as was comfortable. On Wednesday afternoon we paid a brief visit to the pavilion, the southern side of which is largely given to displays made by interior counties, and made some hurried notes on what was most apparent.

The first thing to strike the eye, as one entering the pavilion looks toward the left, is the Solano county exhibit—an exhibit at once interesting by reason of the beauty of the horticultural products which are set out in a style of almost severe simplicity, as if the exhibitors believe thoroughly in the proverb that "Beauty unadorned is adorned the best." This display consists chiefly of fruit, green, canned and dried. Of the handsome pears and peaches, a considerable portion (placards tell us) "has been treated and kept in its natural state since the first week in August by the Allegritti Green Fruit Storage Co.," and is a good witness to the efficacy of the process. A large number of photographs, illustrating the scenery of the county and the horticultural features of life there, embellish the tables. Plates of almonds are quite numerous. Perhaps the greatest novelties in the whole output are the clusters of dates from Wolfskill's, hundreds and hundreds of the fruitlets hanging in a pale-green mass upon their yellow stems.

Just beyond this one meets the advance guard of the Contra Costa exhibit—a long table sustaining big squashes, beets and other vegetables, and a fair array of apples, pears and quinces which have had "no irrigation," while across the alley is the hollow square of tables, whereon lie contiguous Contra Costa's grapes, Kern's wool, honey and orchard trophies and Stanislaus' fruits and corn, above all which sheaves of grain, sprays of pepper foliage and heavy hopvines are gracefully disposed.

Over the railing, down in what we used to know as the Garden, one catches sight of an extended army of bottles, marshaled as in quadruple line of battle; and just above them appears the legend "Napa county," beautifully wrought with apples and grape clusters on a purple background. Nearer approach reveals the fact that not only the expressed and fermented juices in glass, but countless plates of the unbroken fruits, ending with golden citrus spheres, stretch from the wall next Larkin St. to the cool grotto by the fountain.

Passing through the shady archway, we come upon Placer's plums, pears and peaches in lavish outlay.

With a few hasty glances about the annex where Nevada county's minerals sit over against Sonoma's serried sheaves and horticultural treasures; and one long look across the intervening restaurant-stands to where the broad signs aloft: "San Benito county, no irrigation;" "Humboldt county," "Pajaro valley, the most fertile valley of the State;" and San Luis Obispo—no irrigation," invite to near acquaintance; we become aware that our time is up for to-day, and that closer scrutiny and detailed description must be deferred to a later issue.

The State Fair.

Opening Days at the Pavilion.

[Editorial Correspondence.]

Though the State Fair is but opening as we write, and but few exhibits are in complete form, there is enough to demonstrate to an experienced fair-goer that this year's exhibition will be notably fine. In fact one begins to believe it as soon as he catches glimpses of the exterior of the pavilion between the beautiful trees of Capitol Park. The last Legislature declared that the State buildings in this grand inclosure should receive a new coat of paint, and the contractors began with the agricultural pavilion. The colors are well chosen, and the illuminated pictorial work in the four gables of the building is, it strikes us, very well brought out. Entering the building, one is confronted with the new interior decorations, and they are striking in color, unique in design and generally well fitted to give the building a gala aspect which suits well its architecture. These gifts of the people to the society have a counterpart in the excellent work now being rapidly done by the best of exhibitors, and warrant the prediction that before this hasty preliminary sketch can reach the reader the pavilion will be fit to draw visitors from the utmost distance to which its fame shall reach.

The County Exhibits

This year will occupy far more space than ever before. The counties competing for the awards will be greater in number, and the area of the space to be occupied by some counties is also greatly increased. The two counties taking the greatest space so far are San Joaquin and Colusa, each of which has one of the four conservatories in the angles of the buildings. This is the first year that a county exhibit has taken such space. The San Joaquin county display was undertaken by the members of the county Pomona Grange, and citizens outside of the Order have rallied to their support. We found on Monday J. D. Huffman of Lodi, as Chairman of the committee, gracefully discharging the function of commander in chief, at the same time working like a beaver at the undertaking; the others (similarly engaged, each at the work for which he or she was best suited) were Mr. and Mrs. S. C. Waters, Mrs. W. D. Ashley, and Mrs. Joseph Adams. The material they were opening and arranging at the time of our visit showed that San Joaquin would appear in the infinite variety and singular excellence of her products.

The Colusa county exhibit is in charge of F. C. Radcliffe, assisted by F. W. Willis. Mr. Radcliffe says he did not begin early enough with his collection to amass the material which he desired and which his county affords. It was evident, however, that the space had been laid out well, the decorations in commanding style, and we shall be disappointed if the boxes now being opened do not make a very good show on the tables.

Sacramento county has the largest space in the wing usually given to horticultural displays. A great variety of ornamental tables, pyramids, etc., are being erected, and the space is being ornamented as well as a parallelogram can be. The exhibit begins with a large collection of handsome grapes from the Natoma vineyard, upward of 60 varieties being set out by Mr. Platte. The other displays in the county cannot now be specified. Another day will bring them well forward. The Sacramento county exhibit is undertaken by the Pomona Grange of the county, and others are assisting. Those immediately engaged in setting up the display are as follows: G. C. McMullen, L. H. Fassett, E. Greer, Thos. O'Brien, and the ladies Mrs. McMullen, Mrs. Geo. Rich, Mrs. Daniel Flint, Mrs. Greer, Miss Plummer and Miss Aiken.

El Dorado county has space alongside of Sacramento county, and the display is being made by W. R. Selkirk. It will include both mineral and agricultural products, and enough is set out to show that the collection will repay careful study. A large gathering of photographic views of scenes in the county is an excellent feature which all counties should give some space to for the benefit of visiting strangers.

Placer county has a large wall-table and floor space on the other side of the hall. A great profusion of produce is being set out. Placer county did grandly last year, and pro-

poses to keep it up, as this year's collection shows. The display is in charge of B. M. Berry as chairman of the committee, and he is aided by J. W. Terry, H. E. Parker and J. F. Madden.

Humboldt county enters the lists for the first time this year, and does well to step forward, for her grand resources are but little known. The display is by Commissioner Fred W. Bell, who had to bring his material 45 miles by pack train, 300 miles by water, and then from San Francisco to the capital. He deserves great credit for his enterprise in getting up the display, which certainly speaks well for the resources of the county. Many things will bear comment later, but now we can but mention two gems of the display—redwood planks, one 18 feet long by 80 inches wide; the other, a sectional out of a plank showing a width of 11 feet, which is supposed to be the widest plank ever sawed.

Tehama county is having an exhibit set up by P. H. Coffman. H. W. Hand is doing like work with Napa county products. We saw space also set apart for Solano county. These and other county exhibits, which we may have overlooked, will be taken up at another time.

There is some unique architectural work being done with fruit and vegetables by W. R. Strong & Co., two designs, each in a commanding situation. B. N. Bugbey is erecting a fine display of all kinds of agricultural materials from his fine property in Sutter county.

The University is setting up on the main floor a display of cereals in sheaf and grain, a collection of economic plants and a spread of apples and pears from the Standard orchard in Berkeley.

Unique Display.

The honors for unique displays of merchandise seem to fall this year to Weinstock & Lubin and Huntington, Hopkins & Co. The former have a store in miniature all inclosed in glass, fully fitted out with different departments, and the whole complete with modern appliances. In the store the clerks and purchasers are all children in picturesque and grotesque costumes, acting their characters in pantomime. It is wonderfully pleasing in effect, and the aisles are crowded with beholders.

The display of Huntington, Hopkins & Co. has been for weeks in preparation. It is built entirely of hardware and represents an ornamental pagoda with revolving turrets, on which are electric lamps that flash colored lights in every direction. The main tower is some 30 feet in height and the architectural design most beautiful. In front of the structure, on a well-laid track, runs a locomotive and tender. The engine is a perfect model of one of the passenger locomotives, has bell, whistle, air-brake attachments, etc., and is self-acting. The track is something over 40 feet in length, the locomotive and tender 4 feet. The locomotive runs to the end of the track, the engine is reversed automatically and retraces its course, keeping up a constant going and coming, ringing of bells, whistling down brakes, etc.

Notes.

Machinery hall promises to be full and interesting. In the agricultural machinery the newest thing is Lubin's pulverizer, shown by P. P. Mast & Co. of S. F. It is plainly a very effective implement. A great variety of implements and machines is being set up and will be noticed next week in detail.

Report says the stock show at the park will be very large, as all stalls are taken.

The fair and the boom have struck Sacramento together. The streets and hotels are full of people.

The Railroad at Santa Barbara.

One by one the cities and towns of the State of California are being connected by rail with the transcontinental system. The latest one of prominence to receive the benefit of the railroad is Santa Barbara, one of the most charming spots on the coast. This important event was appropriately celebrated on August 19th and 20th, when the first trains came into the city from San Francisco and Los Angeles. The engraving on this page is from a photograph taken on the arrival of the first train.

The Santa Barbara branch connects with the main line at Newhall. It goes through the Santa Clara valley in Ventura county, then along the coast, and back into the Carpinteria valley, and again follows the coast to Santa Barbara itself. It opens up to railroad traffic a large area of agricultural country, and will be of great benefit to the farming communities along the line. The road is to be pushed rapidly north through the Gaviota pass to San Luis Obispo and San Francisco, opening up one of the most picturesque routes in the country.

Santa Barbara has been made a terminal point by the S. P. R. R., and has equal freight and passenger rates with San Francisco and Los Angeles. The city has also the advantage of a harbor, where the steamship lines on the coast trade.

Santa Barbara has, until this time, been comparatively isolated, being only reached conveniently by sea from other centers of population. The climate of the region is unsurpassed, and the city takes high rank as a health resort. There are beautiful homes all about it, and fine business blocks line its streets. The region surrounding the town is famous for its splendid soil and agricultural products. With its new transportation facilities the country thereabouts is put on an equal footing with the most favored localities. Santa Barbara is a picturesque and handsome city, and will now be more largely visited than ever by the thousands of tourists who visit this coast. Not only the town but the whole country is greatly benefited by the advent of the railroad.

The members of the State Forestry Commission have sent out cloth posters containing the section of the Penal Code in relation to setting woods or grain on fire, and inviting citizens to report to the Board any violation of the Act, as well as cases of cutting timber on State or Government land. A reward, ranging from \$25 to \$200, according to the importance of the case, will be paid for information on which an action at law can be raised.

BUTTE AND PLUMAS have the finest and largest sugar pine forest in the United States. Lumber from this region is now being shipped to Australia, and before long large shipments will be sent East.

CENTRAL ARIZONA.

[NO. 3—CONTINUED.]

[Written for the RURAL PRESS by O. C. WHEELER, LL.D.]

Products and Profits.

When the products of a district or a country cover nearly every species and variety between the lichen of the polar North and the sensitive clematis of the torrid South, it seems a useless, as well as a vain, task to attempt to enumerate them. Yet it is perhaps due to a country so little known as this that a partial enumeration should be given.

Central Arizona produces, in addition to the vastly numerous and rich varieties of minerals already enumerated, such grains as wheat, barley, rye, oats, buckwheat, Indian corn, Egyptian corn; also sugarcane and cotton. Cane seems quite at home and yields as regularly and as heavy crops, perhaps, as are grown in any of the sugar districts of the South or in the Pacific islands. Cotton is here no experiment. Long before the whites settled in Arizona, the Indians cultivated and utilized this plant in various ways. More than 350 years ago, Alvar Nunez Cabeza de Vaca, the first white man that ever saw Arizona, found the Indians along the Gila using a cloth, spun and woven by their own

hands, from the cotton they had raised on what is now the Gila and Pima reservation.

The various grasses found anywhere north of the 23d parallel of latitude grow freely and yield abundantly. Alfalfa, perhaps the richest forage plant anywhere cultivated and adapted to general use, often is cut six times in a year, yielding an average of two tons to the acre at each cutting. It is also being rapidly increased in its acreage for pasture, on which, in addition to its common use, thousands of cattle are driven to finish up the "fattening process" after having received all the benefit their mountain ranges would afford.

Among the productions of the soil in Central Arizona, fruits are prominent. While all varieties do well, some are so marked in their yield and in their quality as to arrest the attention and excite the interest of every intelligent person who examines the subject. The grape, in all its varieties, has absolutely nothing to check the rapidity or impair the perfection of its development. This is especially true of the varieties adapted to the production of raisins. The White Muscat of Alexandria, pre-eminently the raisin grape of the world, has been known to mature and ripen fine, large clusters in less than seventeen months from the time the unrooted cutting was placed in the ground; and the regular yield of full-grown vines is enormous. Apples, pears, quinces, peaches, plums, cherries, apricots, nectarines, gooseberries, currants, blackberries, raspberries, and the whole range of garden and field vegetables, all seem perfectly at home here, and with nearly all other fruits they ripen and are ready for market from two weeks to 20 days earlier than the same varieties in Southern California. This is an important desideratum to the producer. Every kind of fruit that is successfully produced within the temperate zone, and has been tried in this district, has developed as freely and fully as though it was indigenous to the soil.

It is, therefore, safe to say that any desirable agricultural product may be relied upon here to readily and fully reward the labors of the tiller of the soil.

As to profits, it is here designed to give

only a few well-authenticated facts, leaving the reader to form his own conclusions as to the probability of general results. Land for a raisin vineyard, uncultivated and without water rights, can now be had at very low prices, ranging from \$5 to \$10 an acre, average say \$7.50. It can be cleared and put in order for planting for \$2.50 an acre. Cuttings for raisin vineyard (8x8 feet, 680 per acre) at \$2 per 1000, \$1.36 an acre. Cost of planting, \$1.50. Water for irrigation, \$1.25. Labor, irrigating and cultivating, \$10.

The entire outlay for labor and water to the end of the third year, with interest at .10 per cent added, need not exceed \$63 per acre, while the third year will produce a crop of grapes worth \$80; and thenceforward the product will increase until a fair average yield will be six tons to the acre, equal in value to \$240.

The profits indicated by the foregoing appear large, but they are far less than have been realized again and again, and will be realized in the future as often as like effort is put forth. Nor are they larger than may be secured by the culture of other fruits, such as peaches, apricots, nectarines, plums, and many other varieties. The cost of land, water rights, clearing, planting and cultivating, of every kind, will not materially vary from the figures given for the production of grapes, nor will the time of beginning to bear (the third year); for, in this climate and in this peculiar soil, and the free use of water, just when needed, trees make very rapid growth and reach the bearing age much earlier than in other condition.

Planted 16 feet apart each way, which is quite enough in this unusually fertile soil, under an almost cloudless sky, there will be 170 trees to the acre. The third year will average 25 pounds to the tree, which, at two cents a pound on the tree, will produce \$85 to the acre. After that they will produce 50 per cent more each year until they average 100 pounds to the tree, equaling 17,000 pounds, and being worth on the trees \$340 per acre each year.

Large as these figures are, and great as are the profits they indicate, they are considerably less than have been realized and officially reported in numerous instances, by practical pomologists whose veracity is beyond all question. And they surely dispose of the question of profits in a way sufficiently inviting to the investor.

The cost and profits of a raisin vineyard, referred to in the foregoing, may be tabulated as follows:

Land.....	Per acre.	\$7 50
Water rights (perpetual).....		7 50
Preparations for planting.....		2 50
Cuttings (8x8—680, at \$2 per M).....		1 36
Planting.....		1 50
Water.....		1 25
Labor (irrigating and cultivating).....		10 00
Total to end of first year.....		\$31 61
SECOND YEAR.....	Per acre.	
Filling vacancies, irrigating and cultivating.....		\$10 00
Water.....		1 25
Total for the second year.....		\$11 25
THIRD YEAR.....		
Labor (irrigating and cultivating).....		\$8 00
Water.....		1 25
Total for the third year.....		\$9 25
Total for the three years.....		\$52 11
Allow interest on \$52.11 at 10 per cent per annum for 2 years (which is surely liberal).....		10 42
And we have a grand total, to end of third year.....		\$62 53
The third year will produce one-third of a crop, or two tons fresh grapes at 2 cents per pound on the vine.....		\$80 00
Or 1333 lbs. of raisins at 6 cents per lb.....		79 98
Recapitulation.....		
The figures in this exhibit are the result of actual developments, and in no sense the theories of speculators. They foot thus:	Per acre.	
Borrowing all the money for all outlay of every kind, and paying 10 per cent interest, hiring all the work, we have, at the end of the third year, expended.....		\$62 53
And have received from partial crop of third year.....		80 00
Or have received over and above the entire outlay.....		17 47
And will have a vineyard free from all incumbrance, each acre of which will henceforth produce above all expenses, more than 10 per cent on.....		1,000 00

(To be Continued)

THE LOCOMOTIVE REACHES SANTA BARBARA.

Breeders' Directory.

Six lines or less in this Directory at 50c per line per month.

HORSES AND CATTLE.

THE BEST HERD OF JERSEYS, all A. J. C. registered, is owned by Henry Pierce, San Francisco.

H. W. COWELL, Stockton, "Morrano Farm," breeder and importer (and agent for Leonard Bros., Mo.) of Aberdeen and Galloways. Young stock for sale.

J. A. BREWER, Centerville, Alameda Co. Short-horn Cattle and Grades. Young stock for sale.

T. E. MILLER, Beecher, Ill. Oldest and best herd Herford Cattle in U. S. Cattle delivered in California.

COTATE RANCH BREEDING FARM, Page's Station, S. F. & N. P. R. P. O., Penn's Grove, Sonoma Co., Cal. Willfred Page, Manager. Breeders of Short Horn Cattle, English Draft Horses, Spanish Merino Sheep and Berkshire Swine.

W. J. MARSH & SON, Dayton, Nevada. Registered Shorthorns of choicely bred strains.

H. van der STRATEN, Hopland P. O., Durham Valley Farm, Mendocino Co., breeder of Shorthorn Cattle (registered). Young stock for sale.

J. H. WHITE, Lakeville, Sonoma Co., Cal., breeder of Registered Holstein Cattle.

GEO. BEMENT & SON, Redwood City. Ayrshire Cattle Southdown Sheep, Essex Swine.

R. J. MERKELEY, Sacramento, breeder of Norman, Percheron Horses and thoroughbred Shorthorn Cattle.

BRADLEY RANCH, San Jose, Cal., breeder of recorded thoroughbred Shorthorn Cattle and Berkshire Hogs. A choice lot of young stock for sale.

M. D. HOPKINS, Petaluma, Cal. Eastern Imported registered Shorthorn Bulls and Heifers for sale.

HOLSTEINS, AAGGIE, JACOB; NETHERLAND and Artis strains; all ages; largest herd to select from. Young bulls, low. (All registered.) F. H. Burke, 401 Montgomery St., S. F.

E. J. TURNER, Hollister, Breeder of Percheron-Norman registered Horses and Roadsters.

SETH COOK, Danville, "Cook Farm," Contra Costa Co., breeder of Aberdeen Angus, Galloways and Devons (Registered). Young stock for sale.

PETER SAXE & SON, Lick House, San Francisco, Cal. Importers and Breeders, for past 16 years, of every variety of Cattle, Horses, Sheep and Hogs.

WILLIAM NILES, Los Angeles, Cal. Thoroughbred Poultry, Cattle and Hogs. Write for circular.

J. R. ROSE, Lakeville, Sonoma Co., Cal., breeder of Thoroughbred Devons, Roadsters and Draft Horses.

POULTRY.

THE PACIFIC INOUBATOR CO., 1317 Castro St., Oakland, Cal., manufacturers of the Pacific Incubator and Brooder, agency of the celebrated Silver Finish Galvanized Wire Netting, the Wilson Bone and Shell Mill, etc. Every variety of Land and Water Fowls. The Pacific Coast Poultryers' Hand Book and Guide; price, 40 cents. Send 2-cent stamp for illustrated 60-page Circular.

T. D. MORRIS, Sonoma, Cal. Toulouse and Embden Geese, Bronze and W. Holland Turkeys, and all leading varieties of Thoroughbred Poultry.

O. J. ALBEE, Lawrence, Cal., breeder and importer.

D. H. EVERETT, 1616 Larkin St., S. F., importer and breeder of Thoroughbred Langshans and Wyandottes.

CALIFORNIA POULTRY FARM, Stockton, Cal.; send for illustrated and descriptive catalogue, free.

E. C. CLAPP, South Pasadena, Cal. Light Brahmas (Williams-Foot stock), Plymouth Rocks (Kieffer-Conger stock). Fowls and Eggs in season. No circulars; write for wants.

MRS. M. E. NEWHALL, San Jose. White and Brown Leghorns, Langshans, Plymouth Rocks, Light Brahmas, Pekin Ducks and Bronze Turkeys.

JAS. T. BROWN, 18 Georgia St., Los Angeles, Cal. Breeder of Thoroughbred Poultry of the leading varieties. Send for circular and price list.

W. C. DAMON, Napa, \$2 each for choice Wyandottes, Leghorns, L. Brahmas, Houdans. Eggs, \$2.

PIEDMONT POULTRY YARDS, J. N. Lund, Box 116, Oakland, Cal.

SWINE.

JOHN RIDER, Sacramento, Cal. Breeder of Thoroughbred Berkshire Swine. My stock of Hogs are all recorded in the American Berkshire Record.

TYLER BEACH, San Jose, Cal., breeder of Thoroughbred Berkshire and Essex Hogs.

REGISTERED BERKSHIRES, BLACK JACK, BESS and REDWOOD imported strains; pairs and trios, not akin, at farmers' prices. Young boars, low. F. H. Burke, 401 Montgomery St. S. F.

WILLIAM NILES, Los Angeles, Cal. Thoroughbred Poland-China and Berkshire Pigs. Circulars free.

I. L. DICKINSON, Lone Oak Farm, Sonoma, Tuolumne Co., Cal., breeder of Thoroughbred Essex Hogs. Pigs now ready for sale. Prices reasonable.

SHEEP AND GOATS.

R. H. CRANE, Petaluma, Cal., breeder and importer, South Down of Long John Wentworth herd for sale.

KIRKPATRICK & WHITTAKER, Knight's Ferry, Cal., breeders of Merino Sheep. Rams for sale.

L. U. SHIPPEE, Stockton, Cal., importer and breeder of Spanish Merino Sheep, Durham Cattle, Jacks and Jennys & Berkshire Swine—high graded rams for sale.

F. BULLARD, Woodland, Cal., importer and breeder of Spanish Merino Sheep. Premium band of the State. Choice bucks and ewes for sale.

ZIMMERMAN Fruit Evaporator.

Read Some of the Testimonials.

I have found the Machine (No. 3) very simple, and it does the work to perfection. Parties who have larger Driers of different makes say they cannot turn out superior fruit (apricots and peaches) to mine.

Vacaville, June 12, 1887. I. W. A. GILMORE.
I found the Machine (No. 2) good, and can truly subscribe to all the merits claimed for it. I have sent apples to Santa Rosa and they sold as first-class.

Laguna, July 15, 1887. W. H. J. AITKEN.
Evaporator came safe to hand (No. 3). Have tried apricots with good success.

Stockton Nursery, July 15, 1887. E. C. CLEWES.
Before writing I wanted to test the Drier also on peaches, apples and pears. Am now doing so with the very best results. Upon the whole, I am greatly pleased with the Drier.

Batavia, July 29, 1887. (Rev. Dr.) W. ALEXANDER.
I am doing fine work with the Drier (No. 3). I bought it in company with Mr. A. J. Lay, and he, after trying it, takes it all. You can refer to me and I will try to sell more.

Glenwood, August 5, 1887. C. C. MARTIN.

I have been using a Zimmerman (No. 3) Evaporator on my apricots this season, and cheerfully attest the fact that its performance is fully up to its promise. Its simplicity is such that, although novices, we have succeeded in turning out admirable work, and its economy and facility are quite remarkable.

S. F. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Sept. 14, 1887.

The past week has been all that could be desired for raisin-makers and fruit-driers. Farmers are reported to have warehoused all their surplus grain and hay. The past week has shown no material change in the Eastern and European wheat market. Although there has been no change, still there is an impression that prices will improve after the farmers have garnered their grain. To-day's cables were as follows:

LIVERPOOL, Sept. 14.—Wheat—Supply large; new No. 2 winter, 6s and dull; do. spring, 6s and dull. Flour—Holders offer freely at 9s 2d and dull. Corn—Holders offer moderately; spot and September, 4s 3d and steady; October, 4s 2½d and steady; November, 4s 3½d and steady.

Eastern Wheat Markets.

NEW YORK, Sept. 11.—Wheat is steady and the tone of the market is heavy. Closing prices: Sept. 79½c, Oct. 80½c, Nov. 81½c, Dec. 83½c, Jan. 81½c, Feb. 85½c, and May 88½c.

Crops at the East.

WASHINGTON, Sept. 10.—The statistical report of the Department of Agriculture for September presents a heavy reduction in the condition of cotton, corn and potatoes, with little change in the status of wheat and other small grains. There is a further loss in the condition of corn from 80.5 to 72.3 per cent. The depreciation is nearly all in the West. The States of the Atlantic Coast and the Gulf report larger crops than last year, and that they are already beyond the reach of disaster. In the seven corn-surplus States the average of last month was 74; it is now 64. The average condition of winter and spring wheat when harvested is 82. In the spring wheat region, Dakota returns 81, a small gain; Minnesota and Wisconsin 72, Iowa 71, and Nebraska 76, a slight reduction from last month. The increase of acreage will make the difference still less between the present crop and that of 1886. The average for rye is 82.2, that of oats 83.4, against 85.6 last month, showing a slight decline. The average for barley is 83, against 86.2 last month. The reduction in buckwheat has occurred from 99 last month to 89. The average condition for potatoes is very much reduced, from 80.8 last month to 67. This is the lowest record for September that the department has ever recorded. The reduction is mainly in the West.

WASHINGTON, Sept. 11.—The weather crop bulletin of the Signal Office for the week ending Sept. 10th, says: In the corn-growing region the crop is reported to have been harvested, and below the average in Nebraska, as out of danger from frost in Minnesota, and more rain is needed for the late corn in Central and Western Kansas. Cutting is in progress in Michigan. Pastures are reported good from Nebraska, as improved in Minnesota, Michigan and Southern Illinois, and as dried up in Northern Illinois. Light frosts have injured sweet potatoes in Northwestern Carolina and Indiana, and occurred in Northern Illinois on the 8th. Killing frosts were reported on the 10th from Central Tennessee and Upper Michigan, and on the morning of the 11th from Northern Vermont.

California Fruit at Chicago.

CHICAGO, Sept. 10.—For the last week the market has been overcrowded with all varieties of home-grown fruits, causing fruit from California to sell considerably lower. The market is rather dull to-day for all kinds. The following prices were received for fruit in good condition: Beurre Hardy and Clairgeau pears, \$1.75 to \$2.25 per box; Tokay grapes, dbl crts, \$2.25 to \$2.50; Muscats, \$2 to \$2.25; quinces, \$1.75 to \$2 per bx.

CHICAGO, Sept. 13.—The market rules lower for pears, but as receipts of home-grown fruit are decreasing, hopes of higher prices for California are entertained. Grapes rule firmer and have a good demand. The following prices were received for fruit in good order, all else lower: Muscat grapes, dbl crts, \$2.25 to \$2.50; Tokays, \$2.50 to \$2.75; Beurre Clairgeau pears, according to condition, \$1.50 to \$2; Duchess pears, \$1.50 to \$1.75; Beurre Hardy pears, \$1.50 to \$1.75; Doynene pears, \$1.50 to \$1.75; quinces, \$1.75 to \$2.

California dried fruits remain steady and firm. There is a good demand and consignments have been taken with such readiness that very little stock remains in first hands. Apricots, sun-dried, bleached, choice, 17½¢ to 18¢; prime, 15½¢ to 16¢; not bleached, 12½¢ to 13¢; peaches, peeled, evaporated, choice, 23½¢ to 25¢; good, 21½¢; unpeeled, unevaporated, fancy, 18¢ to 18½¢; choice, 16¢ to 16½¢; good, 14½¢ to 15¢; unpeeled, sun-dried, 13½¢ to 15¢; plums, pitted, new, 13¢; raisins, loose Muscat, old, 14¢ to 15¢; London hyans, 14¢ to 15¢.

California Products in New York.

NEW YORK, Sept. 11.—Canned California pears, 2½¢ and 3 lbs, \$3.25. Dried Fruits—California raisins continue jobbing at full recent advance in price, 2 crown, \$1.40; 3 crown, \$1.60 to \$1.70; London, \$1.75. Mustard—Yellow California, 4¢ to 4½¢; brown, same, 5¢ to 5½¢.

NEW YORK, Sept. 12.—The Commercial Bulletin reports that the new crop of California prunes is now offered for early shipment. California shippers have offered 60's (avg) at 12½¢ and 40's (avg) at 12½¢, though no sales have as yet been made.

Eastern Hop Markets.

NEW YORK, Sept. 9.—Advices are received concerning the hop crop from various parts of this State. The tornado of the present week damaged the crop to some extent. A sale is reported at Cooperstown of one crop at 20c. Oneida advices are that dealers' contracts are made for hops to be delivered later on at a range in price of from 18 to 20c. Growers have not been in so great a hurry as usual, the reason being the absence of vermin and mold, and a noticeable improvement in the quality of hops which are allowed to hang a few days longer on the poles.

NEW YORK, Sept. 11.—The market moves at an

easy pace and has not sufficient life to develop any remarkable strength. There is a firm tone in London, with a good demand for fine qualities. Coast crop, 1886, best, 13¢ to 14¢; same, common to good, 10¢ to 12¢; same 1885, good to prime, 6¢ to 9¢.

CHICAGO, Sept. 13.—There are no arrivals of new hops, except a few sample bales. The market remains very quiet. Brewers have placed a few orders for small lots, but there is no large demand from any source. New York advices say that the crop has been pretty well secured with most favorable results. Few lots have been sold. Holders are very firm in their views. At the same time buyers lack confidence and are not disposed to take hold. The market is yet hardly settled and for the present rules quiet. There was no change to note in values. Pacific's new crop, choice, 24¢ to 26¢; medium, 20¢ to 22¢; 1886, choice, 20¢ to 22¢; medium, 14¢ to 16¢; Pacific's 1885, 6¢ to 8¢.

Eastern Wool Markets.

BOSTON, Sept. 10.—The market shows some improvement, and although transactions are small, manufacturers are more willing to buy in advance of their actual wants, but prices are still too low to please owners. The total sales for the week are 2,000,100 lbs, as against 4,902,400 lbs, for the corresponding week last year. Among sales are 270,000 lbs spring California, part at 13¢; 250,000 lbs Eastern Oregon at 15¢ to 21¢, and 344,000 lbs Territory at 16¢ to 24¢.

NEW YORK, Sept. 11.—There is no decided change in the situation. Sales include 25,000 lbs spring California at 20¢ to 21¢; 50,000 lbs Territory at 21¢ to 25¢.

The Philadelphia market has not improved in any respect. Sales include 60,000 lbs Territory fine at 15¢ to 20¢; 90,000 lbs Territory grades at 15¢ to 24¢; 50,000 lbs same, medium, 20¢ to 21¢; 50,000 lbs same, choice fine medium, 23¢; 3000 lbs Oregon medium, 19¢.

Local Markets.

BAGS—The market is quiet but firm at from 7½¢ to 8¢ standard Calcuttas.

BARLEY—Receipts are falling off, but the demand holds up, causing a stronger tone to rule, particularly for the more choice grades. On Call there has been more doing at fairly steady prices. To-day's sales are reported as follows:

Morning Session: Buyer season—200 tons, \$1.12½; 300, \$1.12½. Buyer 1887—400 tons, \$1.04; 200, \$1.04½. October—300 tons, 95c. Seller 1887—100 tons, 94½¢ to 95¢.

Afternoon Session: Buyer season—100 tons, \$1.12½; 100, \$1.12½ to 1¢.

BUTTER—Receipts, compared with last year, are light, while the demand is larger. The increase in the call comes chiefly from the south. It now looks as if a still higher range of values will obtain.

CHEESE—The market shows another advance in sympathy with higher values at the East and light supplies here.

EGGS—Receipts continue light, and as the demand is strong, prices are higher for choice.

FLOUR—At the low quotations the market shows an improving tone. The demand is increasing.

WHEAT—Millers are in the market for all parcels of choice obtainable at quotations. Shippers are bidding down, but on Call options continue mysteriously high, when the low bids made by shippers are considered. To-day's sales on Call were as follows:

Morning Session: Spot—500 tons, \$1.27½; 200, \$1.27½; 100, \$1.28½. Seller 1887—100 tons, \$1.28½. Buyer season—100 tons, \$1.42½ to 1¢.

Afternoon Session: Buyer season—100 tons, \$1.43; 400, \$1.42½ to 1¢.

[COMMUNICATED.]

Market Information.

Cereals.

The London correspondent of the *Northwestern Miller* estimates the surplus of the wheat-exporting countries at 260,000,000 bu., and the wants of the wheat-importing countries at 248,000,000 bu.

Quantity of wheat on passage to France Aug. 19, estimated at 680,000 bu., against 1,280,000 bu. same date last year.

The average yield of wheat in the vicinity of Devil's Lake, Dakota, is estimated at 25 bu. per acre. The yield in Eddy county is estimated at 20 bu.

A letter from London, dated Aug. 20, says: Root crops, and those of hay, straw, and beans, are short, and much feeding stuff will be required during the next 8 months.

Quantity of barley on passage for the United Kingdom on Aug. 18, is reported at 1,190,000 bu., against 1,190,000 bu. last year.

The exports of wheat from Jan. 1 to Aug. 1 amounted to 6,696,000 bu., against 7,520,000 bu. for same time in 1886.

Quantity of wheat on passage to Antwerp Aug. 19 is estimated at 680,000 bu., against 1,000,000 bu. for corresponding time last year.

Exports of wheat from India for the week ending Sept. 3 were 95,000 bu., of which 64,000 bu. were to the United Kingdom and 32,000 bu. to the Continent. The total shipments from Jan. 1 to Sept. 3 were 24,796,000 bu., of which 12,204,000 bu. were to the United Kingdom and 12,592,000 bu. to the Continent.

The Cincinnati *Price Current* says: It is a significant matter that while the exports of wheat and flour at Atlantic ports during the past 8 weeks have been 10,000,000 bu. in excess of corresponding time last year, the marketing at primary centers have been 6,000,000 bu. smaller than last year, and the price of wheat in Chicago now 8c a bu. lower than a year ago.

The New York *Produce Exchange Reporter* says that the shortage in the crops of hay, rye, oats, barley, beans, peas, potatoes and beets here and in Europe, seems to be overlooked by the trade; they do not appear to attach much importance to the loss, while on reflection they admit that their places will have to be filled by some other food, but the great shortage in the corn crop in this country exceeds the deficiency in all other cereals, and the question naturally arises, how is this great deficit to be made good? We answer by drawing on the next cheapest food obtainable. The cheapest food now in use is wheat-flour; this is especially true of the lowest grades, and being cheaper than Indian meal, they are quite certain to be in active request for feeding

live-stock. When this becomes very general here and in Europe, then we shall look for a speedy change in the situation. Wheat and corn will command attention and will not require many friends to defend them. The exhaustion of old wheat in this country is every day becoming more and more apparent, and our visible supply of old wheat is more than 50 per cent less than at the corresponding time last year. Very few millers in the winter wheat States hold any old wheat of moment, and traveling correspondents assure us that farmers hold far less old wheat than usual on the 1st of September.

The latest statistics of the domestic movement at the East, of wheat and flour, are given in the following table:

WHEAT MOVEMENT, EIGHT WEEKS ENDING AUG. 27.

	Bushels, 1887.	Bushels, 1886.
Rec'd, 8 primary m't's.	26,488,042	29,335,225
Rec'd, 8 Atlantic ports.	35,730,159	29,772,439
Exp'd, 8 Atl. (and flour).	23,848,335	21,809,377
Exp'd, A. & P. (and flour).	32,379,613	10,154,027

—or about 28.15 per cent of our total probable wheat surplus available for export sent abroad in about two months of the new crop year. This is at the rate of 210,000,000 bu. per annum, while the calculated available surplus for export, wheat and flour, July 1, 1887, to July 1, 1888, is equal to about 115,000,000 bu. The visible wheat in the United States and Canada Aug. 27, 1887, was 30,572,750 bushels, against 31,998,593 bu. Aug. 20, 1887; 41,285,035 bu. Aug. 28, 1886, and 44,646,759 bu. Aug. 29, 1885, being 10,712,285 bu. less on Aug. 27, 1887, than it was a year ago, and 14,074,009 bushels less on Aug. 27, 1887, than on Aug. 29, 1885.

In this State farmers are reported to be holding, now that they have their wheat warehoused, under the impression that prices are so low that any change will be for the better. Millers are also taking this view and do not lose an opportunity in buying choice milling wheat at anything near \$1.45. As many commission houses or firms in this city working with English export buyers, managed to kill off Dresbach, there is no demand from exporters, and will not be if English exporters can help it, until they get wheat down at about cost of production. Many firms here working in their interest are said to be bearing the market, trying to get farmers to sell at very low prices.

Corn has ruled fairly steady throughout the week, the demand being restricted, owing to the near approach of the new season.

Barley has been in good request, and as receipts have fallen off stocks are lighter. There is a good shipping demand for both chevalier and brewing grades, for which good prices are paid. It is now generally conceded that the supply of barley will not equal the demand up to June, 1888.

In oats the market exhibits more strength, but as yet the demand is in a hand-to-mouth kind of way. Rye and buckwheat are steady, with the more choice grades fetching a slight advance.

Feedstuff.

The advance in bran and middlings was caused by the filing of a heavy order from Honolulu. The quantity taken was about 4000 sacks. The filling of this order leaves the market barely steady, with lower prices looked for, unless another heavy order is received. The home demand is quiet, owing to the high prices asked by millers.

Roller barley is firm, but no higher, as are other feedstuffs.

The late rains are reported to have taken the nutriment out of the old grass, which will operate in favor of hay. The consumptive demand continues free. Choice grades are firmly held under a growing scarcity.

Vegetables.

Onions, if choice and good keepers, sell freely at full prices, but poor are slow.

Potato receipts continue free, but under a good demand prices are well maintained, with, at times, something extra placed at our advance on quotations.

Summer vegetables fluctuate daily, being governed by the supply and demand; therefore, even daily quotations are misleading. All shippers have to take chances on receipts being light. Tomatoes are still taken by canners.

It is generally claimed that the West will take all of the cabbages later on in the winter, as the crop there was short.

Fruits.

Choice pears and peaches, suitable for canners and driers, are in good demand. Choice plums, prunes, and figs are in lighter supply, causing stiffer prices to obtain.

Apples are in heavy receipt, causing the market to drag for all that are not strictly choice.

Strawberries and blackberries sell for more money, as do choice figs.

Grapes are coming in freely, with prices favoring buyers. Wine grapes are being gathered, and as offerings are free, prices are a shade lower.

In raisins there is nothing new to report, although present advices indicate an active demand.

In dried fruits, to-day's *Herald of Trade* says that peaches are developing the main strength, though, as in canned goods, a reaction is slowly setting in. Good prices, however, are going to be maintained right straight through the season, handsome prices. Dried prunes are developing strength daily, owing to the concentration of forward French supplies and the rumor of a short crop. There has been an advance of one cent a pound over last quotations. The principal holders are asking an average of 12½¢ delivered East, and it is said that negotiations are on foot looking toward the control of the prune crop of California.

The London *Grocer* in remarking on raisins says that the quality and condition of Valencia are satisfactory for first arrivals, but the long prevailing dry weather has been prejudicial to the size. Of Sultanais the same journal says: The quality and size are stated as being much inferior to last year, and the overland samples which have arrived fully confirm this report. The quantity is estimated at about 20 per cent less than that of last year.

Live-Stock.

Bullocks are steady, with the more choice conditioned and handy sized fetching a slight advance. Mutton sheep are barely steady, under free offerings. Young calves are more inquired for. Hogs are weak at a shade lower quotations, owing to the offerings being in excess of the demand. The packing establishments are running to their full capacity.

(Continued on page 237.)

Complimentary Samples.

Hardware and Agricultural Implements. IMPROVED GRANGER GANG PLOWS.

WITH ONE EXTRA SHARE TO EACH BOTTOM.

The Improved
GRANGER GANG,
as now constructed, is con-
ceded to be the best Bench
Beam Plow in use. It has
superceded the reversible
Mold Gang wherever intro-
duced; it being more du-
rable, lighter draft, does
not require the amount of
team, and leaves the
ground in much better
condition.

WITH LIFTING DEVICE.

Its success has been unparalleled, and meets a long-felt want for a cheap and effective Gang Plow in a very satisfactory manner.

It has demonstrated conclusively that our plan of putting shares on the bottoms, instead of using what are called "reversible" molds, is the right one. We have proved that one of our small, thick, cast steel shares will last as long as both edges of a double-edged mold, and when it is worn out it can be replaced for less cost than a reversible mold.

A reversible mold is necessarily of an awkward, clumsy shape, being simply a concave piece of steel, just as a board would warp if laid in the sun.

By using shares on our bottoms, we are enabled to make the mold-boards of a form that will draw as easily, and turn as well as those used on any plow.

We put from three to eight plows in a Gang. They cut from 8 to 10 inches each, and will plow from two to six inches deep. This plow is made in a style never before attempted in this State. The frames, which are clear, well-seasoned lumber, are put together in the strongest manner, and are well painted. The wheels are provided with improved detachable hubs, that can be cheaply replaced when worn out.

One of the forward wheels is a castor, thus permitting the plow to run freely, and effecting a great saving in the draft. The bottoms are provided with our chemically-hardened steel molds, that will wear three times as long as the soft sheet steel molds used by other manufacturers. The shares, which are of double thickness near the point, are cast steel, and can be easily and quickly sharpened when necessary.

These Gangs do their work evenly, leaving the ground in light friable condition. They have been thoroughly tested in the field, and the set of the plows on the frame carefully adjusted to secure the lightest draft consistent with good work. SEND FOR ILLUSTRATED CIRCULARS AND PRICE LIST.

VALUABLE IMPROVEMENTS HAVE BEEN
ADDED THIS YEAR.

This Mill has been in use on this Coast for 6 years,
TAKEN THE PREMIUM AT THE STATE FAIR

Four years in succession, and has met with general favor,
there now being

Over 200 of them in use in California, Nevada & Oregon
It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

DURHAM, May 21, 1887.

Mr. M. L. Mery—DEAR SIR: In reply to yours of the 19th, would say that I crushed from two to two and a half tons per hour, but could crush three and a half tons per hour if my elevators were large enough to carry the barley from the machine. The No. 1 machine I used at Gridley was run on a sack a minute, but if we got behind we could run through five tons an hour, and do good work. The machine I use here is a No. 2.

Yours, WM. M. TAYLOR.

GRAINLAND,

BUTTE CO., CAL., June 9, 1887.

Mr. M. L. Mery—DEAR SIR: We have used one No. 2 Roller Barley Crusher now for eight years and have used it steady during that time; have crushed 45 tons a day, and the crusher is as good to-day as when it came out of your shop. I am satisfied that it is the best mill made. You may reconstruct this testimonial to the best advantage for you and sign our names, for you cannot overrate the merits of your mill.

F. E. REAM,
JOHN P. SUTTON.

ORLAND, CAL., August 5, 1887.

Mr. M. L. Mery—DEAR SIR: In reply to yours of August 1, 1887, regarding the mill I bought of you, would say that the No. 2 gives perfect satisfaction, and that I can crush from 1000 to 1200 sacks of Barley per day. I will recommend it to the public for good work and lots of it.

M. C. DILLMAN.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

The Land Boom Supplemented by an Immigration Boom.

To the non-resident, and even to the careless observer at home, it will doubtless seem that the people of California are greatly overdoing the business of selling real estate. That there has been, within the past year or two, a wonderful and unexpected activity in this kind of property, accompanied by a proportional rise in prices, must be admitted. But it seems equally true that this movement is based on a solid and enduring foundation. Were only land, town and city property included, we might consider these prices extravagant and this activity premature. But there has been in this State an advance all along the line. It has not been confined to any one industry or class of values, but has extended to nearly all. Almost every branch of business has here been prospered of late, a very material increment of population having meantime taken place. It is to this widely diffused prosperity, coupled with an abiding faith in its continuance, that we are to look for the underlying causes of these extensive sales and high prices of land. The movement is but an expression of popular confidence in the future of California; and, if in some few instances the business has been overdone, we need hardly anticipate anything like a general, much less a speedy and violent reaction.

The steady increase of immigration that has marked this era of advancement, appears likely above anything else, to insure for it permanence and stability. From 1872 to 1886, inclusive, the westward travel over the Southern Pacific Company's lines amounted to 815,656—eastward, to 500,828, denoting a net gain to the population of the State of 314,828, for these 15 years. Add gains, meantime, through other channels and increase for the present year, and there will have been added to the inhabitants of California during these 16 years hardly less than half a million people. Since 1880 the travel both ways has been steadily augmented, the westward bound for 1887 being estimated 120,000; eastward, 75,000, making a gain for this year of 45,000.

The natural advantages of California constitute its principal attraction to the immigrant, and yet low fares have much to do with promoting immigration, the periods of low prices being those in which the westward movement

has been most active. In 1875 first-class passage from New York to San Francisco by rail was \$138; emigrant, \$65. These rates are now \$95.30 and \$62.50 respectively, while immigrants are brought through in much less time than formerly. The latter rates were inaugurated in February, 1886, since which date travel over the S. P. Co.'s system has been increased fully 75 per cent. Should the rates by rail be reduced no further, California is bound to see an immense influx of people from the East, the calculation being that a much larger number

be that the company on full consideration will not see their way to such results as would warrant their carrying it into effect. But it is a grand conception, and put into execution would bid fair to fill the measure of California's prosperity to overflowing. It would do more—it would glorify the age in which we live. To carry the poor but deserving immigrant so long a distance free, or nearly free, of charge, were an act of provident magnanimity whose like has never been witnessed in the annals of commercial enterprise. In the countries where

A Mountain Home.

The accompanying illustration affords a glimpse into one of the most picturesque and lovely regions of the State. The scenery of the Santa Cruz mountains is world-famous for its variety and beauty. Glen and mountain, forest and stream, are there blended in delightful fashion. The combined effect is nowhere more pleasantly shown than at the Summer Home Farm, near Glenwood, owned by Mrs. B. C. Brown, of which the picture is a bird's eye view. The cottage is surrounded by vineyards and orchards of prunes and pear trees. On either hand the mountains rise to a great height, covered with redwood and fir. Here and there springs of cool, clear water ripple forth. Near by a mountain stream flows through a romantic gorge. At the farm, its waters are collected and formed into a lovely lake, which, lying in the deep shade, affords excellent facilities for bathing and rowing. Over all broods a climate at once delightful and salubrious. Intense heat and severe cold are alike unknown. A refreshing breeze comes from the ocean, only eight miles distant, and the surrounding air is always charged with the healthful odors of the mountain woods.

VIEW OF SUMMER HOME FARM, SANTA CRUZ MOUNTAINS.

will arrive during the next six months than have ever before come in a like period.

In fact, the land boom being well under way, there is now talk of an immigration boom, the latter a sort of corollary or sequence of the former. Having so much land to sell, we naturally want buyers, to which end there must needs be more people brought into the State. The majority of those already here either have as much land as they want, or are engaged in pursuits that preclude them from owning land to advantage. They are residents of towns and have their occupations therein, or miners, lumbermen, mariners, fishermen, etc. The land-hungry are oftener those who come to us from abroad, especially the peasant classes from continental Europe.

At this juncture there comes a rumor that the S. P. Company have it in contemplation to adopt a schedule of prices still more liberal than that now in force upon their system of roads—in fact, the new plan would virtually amount to the free transportation of certain desirable classes of immigrants were they minded to come to California.

This policy, however, has not been determined upon, but only talked about, and it may

they are, these poor people, work and save as they may, can make no more than a wretched living, and often not even that. Remaining there, they can neither escape from nor hope to improve their condition. And yet in California is room for them all, if by any means they could get here. To enable them to do this were the part of genuine philanthropy, though self-interest were the impelling motive. A very refined species of selfishness, this, that works its end through so much good to others!

Were this scheme, or something like it, carried out, it would make a new era, not only in the history of California, but also in the history of passenger transportation. As it would bring us generally people of the right kind, it would be the means of enhancing the value not only of land but of every species of property throughout the State.

THE sheepherders who make annual visits to the mountain ranges of Inyo, Mono and Alpine counties are causing great destruction by setting fire to the brush and allowing the flames to communicate to the timber, and large sections of the finest timber in the Sierras are destroyed.

IMPORT DUTIES ON FRUIT.—At the July meeting of the State Horticultural Society, B. M. Lelong, E. H. Rixford and Rev. A. H. Perkins were appointed to consider a circular sent out by the N. Y. Tribune in regard to revising the tariff on foreign fruits. The committee met on Tuesday last and agreed to refer the matter back to the society for further discussion at the meeting to be held Friday, Sept. 30th, at the rooms of the State Board of Horticulture, 220 Sutter street, S. F. All interested are invited to attend.

MORE than 200 men are at work at Palo Alto on the buildings of the Leland Stanford, Jr., University. The walls of the four main buildings are now about three feet in height. As grouped, the buildings present a combined front, to be joined by a stone arcade of 576 feet. The chapel, the foundations of which are laid, is in the center of the group of buildings as planned, and the entrance to it will be directly by the main entrance to the buildings.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Santa Barbara Notes.

EDITORS PRESS:—The Lima bean harvest has commenced. The crop does not promise to be heavy, but prices have an upward tendency and probably will be higher than for several years past. Some of last year's crop has been sold lately, and the new crop is being contracted for.

Walnuts are dropping unusually early. The crop is very heavy, and much of it has been contracted to San Francisco parties. A great deal of fruit has gone to waste, and that mostly on account of the high freight rates and length of time taken for transportation. The growers had hoped for a quick transportation at reasonable prices by the railroad, but were doomed to disappointment in both cases, and thus considered it better for the fruit to rot in the orchard than to ship without profit.

The Santa Barbara County Horticultural Society has become an incorporated body, with the following gentlemen as directors: H. C. Ford, P. C. Higgins, O. N. Cadwell, E. Harper, Thos. Hosmer, Jos. Sexton and S. L. James. The officers of the society are H. C. Ford, president; O. N. Cadwell, vice-president; Jno. Spence, secretary, and Edward Harper, treasurer. The members number 34. The society is a live one.

Mr. Higgins of Carpinteria has sold a quantity of asphaltum, and the buyers are now busy digging and blasting it out. It is being used for street-paving and sidewalk purposes. The deposits on the coast are immense and will prove a bonanza to the owners.

The real estate business is booming and affairs are greatly unsettled as a consequence. Five town sites have been, or are being, marked out in the Carpinteria valley, thereby cutting up some of the finest ranches, one or two in Montecito and so on up the coast on the line of the railway. Several franchises for street railways have been granted in Santa Barbara and building of the roads commenced. A franchise for a road to connect the valleys of Carpinteria and Montecito with Santa Barbara has also been applied for. New houses are going up in Santa Barbara with increasing vigor, and the lumber business is exceedingly brisk. Land in the vicinity of Santa Barbara is becoming too high in value for agricultural purposes, and many ranches have been sold for high figures. Several Carpinteria farmers have sold their places and bought land at Lompoc and vicinity, at which place they will make their homes.

Carpinteria. L. B. CADWELL.

Matters in Yolo County.

EDITORS PRESS:—Our part of the State is beginning to feel the impetus of the "boom," as is evinced by the activity of our real estate market. At first there was a good deal of "jack-knife trading," with a bonus every time between residents, but lately there has been a good deal invested by outside parties, some for speculation and others for locations. Town lots are most in demand; still vineyards and orchards are changing hands frequently. Last week a Mr. Hoffman, on Cache Creek, sold his 21-acre vineyard for \$4100 to a San Francisco gentleman; also Mr. A. J. Hall sold his 80-acre vineyard for \$250 per acre, and the purchaser has been offered \$2500 for his bargain.

Wildcat speculation does no good to a community; on the contrary, it does harm. But a healthy influx of home-makers from the overcrowded portions of the East is welcome, and to such we say: Come among us and help develop our vast resources and build up a home that can be surrounded by temperate and semi-tropical fruits, where one can sit under his own vine and fig tree, where there is no fear of blizzards, sunstrokes nor cyclones. These things alone are worth enough to justify investment in a home.

The writer has spent the greater part of his life on the bleak prairies of Central Iowa, and the contrast between there and here is so great that after nine years' residence in this State there is no question as to desirability of location.

After a stay of five years here, the writer had occasion to visit the East during fall and winter. A week was spent at his old home, and the blizzard that then interviewed him will never be forgotten. The mercury went down to 34° below zero—it almost makes him shiver yet, when thought of. But this is disagreeing. Judging by the preparations now being made, this winter will be the busiest one ever experienced in our county in the way of tree and vine planting. Along with that there are other enterprises afoot that will assist materially in business activity. Among them is a cannery, a paper mill, and a woolen factory in Woodland. The first is almost an assured fact, the others are likely to be, and there is a probability of our having communications opened to Marysville again over the old railroad from Knights Landing, on the Sacramento river, which was abandoned several years since on account of the grade being too low for high water, as it crosses the tules. Now, however, since communications are being opened up to Oregon it becomes valuable to the railroad people as a short cut. At least, that is the talk and general opinion.

Ruin-making is in "full blast" now, and

every available man, woman and boy is employed picking or packing grapes, and picking hops along the river. There never has been a time in the history of this county when our help was so scarce and in such demand. The hop-men very largely employed white help this year to the exclusion of the Chinamen. It is getting pretty thoroughly demonstrated that Chinese help, if cheap by the day, is dear by the job, and the tone is so healthy in that respect that any in the East who contemplate coming to this country to labor need not delay longer on account of the Chinaman, as he will not figure to any extent in the fruit and hop business if white help can be obtained.

J. R. SPRINGER.

Woodland, Sept. 1887.

Sonoma County Notes.

EDITORS PRESS:—The early rain has laid the dust, and roads are in fine condition. Dry feed was much damaged. The air is as pure as spring's, and were it not for falling instead of budding leaves, one might well think it the beginning of another year, so pleasant is out-of-door life just now. Thrashing was suspended for a few days, owing to the rain, but the grain was not damaged in the least.

Fruit harvest is well-nigh over. The yield has been very large, and prices have ruled high. Dried fruit, of which there is much in the county, is bringing profitable prices. Canneries and driers have done a slashing business this summer. The Santa Rosa Packing Co. is now busy putting up green corn.

Sheep-shearing—fall clip—is now receiving attention from those who are engaged in the care of the flocks. The wool is said to be unusually free from burrs and dirt and of excellent growth. No doubt the price will correspond.

The grape crop is much better than at first reported. The earlier varieties are now fully ripe, but the better sorts of wine-grapes are not yet mature. None of the wineries have commenced operations, but most of the cellars are being put in order, and about the 20th of this month wine-making will begin. The price for grapes has not been named either by buyer or seller, though indications are that they will be somewhat cheaper than last year.

Rumor, somewhat well authenticated, says that cars will be running from Santa Rosa to Benicia by the first day of January, 1888. We should all like the honor of celebrating New Year's Day by an excursion to Carquinez straits and the good old town of Benicia. One thing is sure—the road is to be built, and that soon.

Sonoma county real estate is in good demand at good prices. No boom, but a square, fair sale, with full value for the price paid.

Santa Rosa is soon to have another street-car line. This is a sure sign of steady growth. It is reported also that railroad fares to S. F. are to be reduced. We hope it is true.

OCCASIONAL.

Santa Rosa, Sept. 13, 1887.

METEOROLOGICAL.

Dr. Gally on Cloudbursts.

EDITORS PRESS:—Did you ever take note of a rural boy—a stout boy—at home, walking one way while looking another way, when he fell over a log? You did—all right. Now, if that young ruralist was possessed of an observant turn of mind, he would arise and investigate that phenomenon, and then, being possessed of a good memory (as, mark you, most investigators are so possessed), he would carry his conclusion, whatever it might be, forward into life as part of his stock of information. That is the way I, myself, became owner of several and sundry portions of information outside my regular business. I fell over them, unless, as was sometimes the case, they fell over me. That is what makes my contributions to the RURAL PRESS rather miscellaneous. Well, here we go again. When I was mining in Nye county, Nevada, and laying the foundation of the town of Tybo, in that county, I took a long, roundabout, roadless ride on horseback of over 100 miles, to Eureka, Nevada, "all on a summer's day" or two; and very hot days they were. I forget the day or the year, but perhaps it was in 1871 or 1872 A. D. All day long, the first day, as I rode the homeless, houseless, roadless desert alone, there loomed in front of me the tall crest of the Diamond mountain, situate some miles north of my destination, and on its side, away up toward the summit, was one spot of white snow—the snow of last winter still not thawed; and though I then supposed that there might be several acres of snow up there yet, in the long perspective of 50 to 75 miles of the distance I was shortening, stride at a time, it looked to be just about as much icy substance as I then needed to cool my "parched tongue." I could not help seeing that snow all day long, for I was riding right at it. It was a great aggravation, because in the clear desert atmosphere, 50 or 70 miles is to the eye but a short promenade, and I was plainsman or desertman (which you choose to have it), enough to know that. The nearness to the eye and the fairness to the fact concerning that exalted spot of ice-cold, "hope deferred" so forcibly reminded me of one of the

songs my best girl used to sing, when I leaned away back East, on the corner of the piano, turning the music sheets, that I thought I would sing to myself (and the horse):

"beautiful star,
Thou art so near and yet so far."

And now, whereas, in remote former times—*temporibus antiquissimis*, in fact—I could troll a ditty with the best beau in the county, on this occasion the failure was so dismal and the dry croak so alarming that I wheeled the horse about to see if some other fellow wasn't doing that; and when I wheeled about I saw a cloud in the sky coming from the southeasterly. I had not seen a cloud, barring a dust cloud, for many months, because in Southern Nevada a fog cloud or rain cloud is what you seldom see, and this was not a very big cloud—not to the eye bigger than a country schoolhouse, but it was flying toward Diamond mountain and flying pretty fast; and I noticed that it was a rather dark, though not what is called a black, cloud. I turned my horse's head again toward my spot of snow, and then I beheld another cloud coming, away off, from the opposite direction toward this first cloud, and both clouds heading for the Diamond. As they approached each other and the mountain they both grew larger and they both got blacker. I was approaching the Diamond at the gait of six to eight miles an hour, but my cloud (that is, the one I first saw) soon, like Mac's dagger, "marshaled me the way that I was going," and outran me as though I stood still; but I could see him all the same, and as he neared the mountain he began to growl and rumble in a sort of big, low roar. The other cloud set up the roar as he approached the mountain, and both clouds flashed red, now and again. By and by both clouds came together around or over the Diamond mountain, in a canyon of which is situate the mining town of Eureka, and there they roared and bolted and spit sheets, streaks and zigzags of lightning for about 30 or 40 minutes, and then all was again clear and still; but my spot of snow was gone.

I slept that night, after a very long day's ride, alone in the desert to the reverberant music of the cumulative coyote. Next day, about noon, I rode down the canyon into Eureka, but when I had reached the forks of the canyon, I found the bottom washed out of the road, and general destruction of everything that water could sweep away. Meandering among gullies and scaling along hillsides, I reached Eureka, and there was a scene of havoc, mourning and ruin. Several persons were dead—drowned—or rather choked with mud; and the main street of a prosperous town, almost a city, was a yawning ditch ten feet deep and twice that many feet wide. The rink, a large wooden structure, was whirled off its base, houses were torn to pieces, iron steam-boilers were carried clear below town, and great, heavy quartz-wagons broken into stove wood. Three to five miles below town, out of the canyon in the Diamond valley was a dump of debris about a mile long, consisting of parts of everything used by a civilized, industrious people, mixed with branches of trees, stones, and mud. And yet not one drop of rain had fallen in Eureka or within two miles of that town. The water—the flood—had all come of and from those two clouds which I had watched and listened to on the day previous. The same clouds which blotted out my spot of snow and destroyed my hope of a gulp of ice water. It was a "cloudburst."

The Theory of Cloudbursts

Is that two currents of electricity, particularly in our higher metallic altitudes, get up a sort of a footrace in a contest to find out and prove which can get to the summit of a high mountain first, and, being of a very thirsty nature (as is a well-known fact regarding electricity), and the race across the horizon being a long and dry one, they sometimes overdo it by carrying too much water, and, not steering straight, they come together kerwhack and spill everything on top of the mountain. This theory, however, does not suit me so well as the one upon which my pious father, who was a Methodist exhorter, used to rely when singing—

"God moves in a mysterious way
His wonders to perform;
He plants His footsteps on the sea
And rides upon the storm."

I am becoming each day more and more satisfied that my father's solution of scientific phenomena is based upon a very complete and handy basis. I think that eventually, if I survive my own errors long enough to be otherwise wise than in my "own conceit" I will adopt the parental philosophy.

I had another interesting—that is, it was interesting to me at the time, very—interview with a cloudburst, which I will probably relate on some future occasion.

Perhaps, when all is said, the "cloudburst" is but a form of the cyclone, modified by the shape of the country. At a cursory glance from an unscientific eye, the true cyclone on land is a phenomenon peculiar to great interior valleys opening toward the north or the south pole; and we will remember that the space of territory between the great ranges of the Rocky and Sierra Nevada mountains, though terribly tossed, tumbled and broken, is, after all, a great valley; and I am willing to suppose that if a philosopher could go ballooning about and around at a level of 6000 feet above tidewater for about 20 years in the territory I have last spoken of he would be struck by a regular cyclone. For I think the cyclone is up there. I have thought so ever since I saw those clouds

whirling across the sky in Nevada as hereinbefore related.

I would say that if any really scientific gentleman should wish to use the description of how the cloudburst at Eureka was born as an instance of that character of phenomena, he need not be deterred by the levity which seems to be evinced by this writer. The facts as set down are facts—the great cloudburst at Eureka, Nevada, is a historic fact.

Watsonville, Cal.

J. W. GALLY.

ENTOMOLOGICAL.

The Cottony Cushion Scale.

Important Discussion of its Identity.

We have been favored with the opportunity of presenting to our readers in previous issues several most important contributions to knowledge of the cottony cushion scale (*Icerya purchasi*). This week we have the first publication of an interesting letter from the entomologist who named the insect, W. M. Maskell, Registrar of the University of New Zealand, and comments upon the letter by Prof. C. V. Riley, U. S. Entomologist. Though the letters include some technical matters, which only an entomologist can fully appreciate, we deem the publication still of value to all our readers as an incentive to more wide and close study of the pest which is doing such great injury in some parts of this State. We omit the introductory paragraphs of Mr. Maskell's letter and begin at the point where he takes up the subject at issue:

Mr. Maskell to Prof. Riley.

I will come now to the points directly raised in your letter of May 19th, viz., the original dwelling of *Icerya purchasi* and its identity with, or difference from, *Icerya sacchari*. First, as to its home. I have not myself much doubt that it came originally from Mauritius, as I indicated in my letter to Mr. Klee; but it is quite probable that it came to us in New Zealand and from Australia. I say no more than probable, because much Mauritius sugar comes to Auckland, and *Icerya* might have come direct; still, its appearance here, and at the Cape, and in California, on Australian plants, points to Australia as the "distributing center." You did not send me the extracts from Mr. Kirk's letter to you on this subject which are referred to in your article in the PACIFIC RURAL PRESS, but I understand from him that he considers Fiji made us a present of *Icerya*. Certainly, it might be indigenous there as well as in Mauritius, though I doubt it; but Fiji was out of the lines of communication when *Icerya* traveled to the Cape and to California, and the suggestion is, I think, quite erroneous. In my letter to Mr. Klee I went no further than saying that Australia presented this pest "to you and to us." I clearly indicated that, in my opinion, Australia had received it from Mauritius, and I hold that opinion still.

For one reason I regret that this conclusion should be correct. I gather that your object in America in ascertaining the home of *Icerya* is that you may attempt the introduction of some parasite or other for its destruction. I fear much that the prospect is not encouraging. It is held by some that climate does not greatly affect insect life; this view I have heard supported by many "practical" men. It is not easy, in the face of facts, to see how it can be seriously entertained. That care and attention, combined with time, may acclimatize anything, may be true. But would not the difficulties be very great, if not insurmountable, in the case of insects from a tropical climate transported to a temperate one? In your Southern California districts the change may, perhaps, be startling, but even there could you venture to turn out loose a few specimens of Mauritian Hymenoptera in the hope of their breeding on *Icerya*? As for this country, I feel convinced that the experiment would be useless. Insect parasites are of no help to us now, and there is little hope from introduced ones. It may be said that *Icerya*, having borne very easily a change of climate, its parasites might also bear it. But *Icerya* is exceptionally and, indeed, wonderfully hardy, and may form by no means a good criterion.

Secondly, as to the identity of *I. purchasi* to *I. sacchari*. As you have asked my opinion on this point, I venture to trouble you with it in some detail. Should you find my notes too long or wearisome, I beg you to pardon me. In my paper of 1878 (N. Z. Trans., Vol. XI, p. 221) I mentioned the following points as marking the specific differences between the two:

1. Color, yellow for *I. sacchari*, reddish-brown for *I. purchasi*.
2. More complete cottony envelope for *I. sacchari*.
3. More hairy larva, and different arrangement of the hairs on larva of *I. sacchari*.
4. Tritubed lobes (*lobes en troffe*) on abdomen of larva of *I. sacchari*, not on *I. purchasi*.
5. More distinct segments of *I. sacchari*.
6. In my paper of 1883 (N. Z. Trans., Vol. XVI, p. 140) I added the following:
7. Absence of longitudinally grooved ovicac in *I. sacchari*.
8. Absence in *I. sacchari* of the great tufts of black hairs.
9. Smaller number of circular spinneret-orifices in *I. sacchari*.

In my letter to Mr. Klee I remarked: "May there not be two in Mauritius?" The question

was based on the foregoing points of difference, on which I now proceed to remark.

Nos. 1 and 5 may be set aside as of little importance. All the specimens of *I. sacchari* which I have seen are undoubtedly yellow and *I. purchasi* is always brown or reddish brown; but a difference of food (sugar as against citrus or acacia) might account for this.

2. *The Cottony "Envelope."*—By this I meant to indicate, not the ovisac, but the cotton on the dorsum and sides of the adult. Here I am still of opinion that there is a difference, but am open to the view that it may be accidental, as I have seen so few specimens. Still I observe two things: First, that my specimens of *I. sacchari* do show more dorsal cotton than *I. purchasi* show in New Zealand; secondly, that Signoret says that adult appears "sous la forme d'une masse cotonneuse." This could hardly be said of *I. purchasi*.

3. *More Hairy Larva and Different Arrangement of Hairs on Larva of I. sacchari.*—Here we have a clearly "specific" difference. I based it originally on Signoret's description of the larva: "Excessivement remarquable par la longueur de la pubescence... sur les cotés et à l'extrémité de l'abdomen." I have compared specimens of larva of both insects quite lately, and it seems to me clear that the hairs of *I. sacchari* are probably more numerous, and certainly longer and thicker than those of *I. purchasi*. I would therefore feel inclined to alter my opinion on this point.

4. *The "Trifoliated" Lobe.*—This I must abandon, as examination shows me that the larva of *I. sacchari* has not a "lobe en trefle," but the six small lobes of *I. purchasi*. Signoret seems to have been in error here.

6. *Absence of Longitudinally Grooved Ovisac.*—I am still unable to decide as to this, as none of my specimens of *I. sacchari* show a fully developed ovisac. Yet I remark that in every specimen I have seen of *I. purchasi*, where the insect is just beginning to form the ovisac, the grooves, even from the first, are plainly to be made out; and this is not the case with any I have seen of *I. sacchari*. For the present, therefore, I am inclined to adhere to the opinion that the ovisac of *I. sacchari* does differ somehow from that of *I. purchasi*.

7. *Absence of the "Tufts" in I. Sacchari.*—This character must, I think, be maintained. When I received specimens from Dr. Signoret I dissected one and mounted another on a micro-slide for my cabinet of coccids. In neither of these two was there any appearance of the great black tufts so characteristic of *I. purchasi*. The body exhibits a number of short, fine hairs indiscriminately scattered, and possibly these may be more numerous at the two extremities; but I see nothing like those of our insect. Here and there some longer and thicker hairs are seen, sometimes singly, sometimes in pairs or threes, but no "tufts."

I recognize as very important the statement in your article in the PACIFIC RURAL PRESS that "the tufts of black hair are extremely variable in quantity, sometimes making the insect look quite dark; at other times, so scarce that the insect has an almost uniform reddish-brown appearance." But you do not affirm that in any case they are absent altogether, as in the specimens I have examined of *I. sacchari*. And as regards *I. purchasi* in New Zealand, I think it may be said that the tufts are always present and conspicuous. I never, in my earlier examinations, saw one without them, and since receiving your letter have examined 16 others, adult females, and they all exhibit the tufts, even the lightest colored among them.

I venture, therefore, for the present, to maintain as a specific character this, which appears so constant in *I. purchasi*.

8. *Smaller Number of Circular Spinnerets in I. Sacchari.*—This character again was taken from the two specimens I examined, one dissected, the other mounted. Comparing to-day my mounted specimen with one of *I. purchasi*, I find that the number of circular orifices on our insect may be considered as nearly double of that in *I. sacchari*.

Considering, therefore, the whole of the above points originally supposed by me to be distinctions, and after eliminating those which may be taken as untenable, there seem to remain quite sufficient to warrant the retention of *I. purchasi* as a distinct species. I allow, of course, that if plenty of specimens of *I. sacchari* can be obtained, and if they fail to corroborate what I have advanced, the two insects must be taken as identical. To make this clear, however, a search at Mauritius itself would be desirable; for, if examination is confined to specimens sent from there, one could never be sure that the sender was fully conversant with the insects. My own impression is, as I said to Mr. Klee, that there are two in Mauritius, and this would have to be well ascertained first of all.

The distinctions which I draw are, of course, purely for purposes of scientific classification. As regards economic purposes, it does not matter whether the insects are distinct or identical, provided that we are sure that Mauritius is the original home; and this, I take it, seems irresistibly the conclusion from the evidence.

Permit me to add a word or two about the male insect. At the time when you wrote your Departmental Report and your article for the PACIFIC RURAL PRESS, you could not have been aware that I had already described the male. Our New Zealand transactions unfortunately can only be issued once a year—about June. I read in January last a paper embodying a description of *I. purchasi*, male. The

paper was really written three or four months previously, but I kept it back to the last moment, in case I might have some other coccid to add to it, and my "Eriochiton hispidus" so turned up. I forward to you herewith a copy of the paper in question, together with another on coccid honey dew. At the time I wrote I knew of no published description of the male *Icerya*.

Dr. Signoret sent me six females of *I. sacchari*. Of these, as I said above, I mounted one and dissected another. Two I presented, along with a large collection of coccids, to the Colonial Museum here. One I propose to keep for myself for future use; and the sixth I send to you herewith, in a small registered box which I trust will reach you safely. In the box I have ventured to include also some specimens of a few of the more curious of our New Zealand coccids; it would give me great pleasure to send you more, but my collection has been so denuded by repeated gifts to different people that I have none to spare. However, should you wish it, I shall be glad to collect for you as many species as possible. Those sent herewith are in alcohol, which has taken all the color out of *Ctenochiton viridis*, which should be bright green.

Comments by Prof. Riley.

EDITORS PRESS:—Just as I was about to sail for Europe several interesting communications from New Zealand came to hand, among others the foregoing from W. M. Maskell, which contains so much of importance bearing on the question of the original home of the Fluted *Icerya* that (having his permission) I send it to you. From Mr. Maskell's own showing, differences Nos. 1, 4 and 5, which he indicates between *I. purchasi* and *I. sacchari*, may be set aside. They have no specific value whatever. Nos. 2, 6 and 7 have been discussed in my last communication to your columns on the subject. They may, without serious question, I think, be disposed of, as sufficiently accounted for by known variation in the species and the condition of Signoret's materials. To dry cabinet specimens, Signoret's expression "sous la forme d'une masse cotonneuse" will often apply, and there is great variation in this respect, while the absence of an ovisac in *sacchari* with all the other structural characters generally similar is inadmissible until we have more positive knowledge of *sacchari*. The tufts of black hairs, as I have already shown, are a very variable quantity, and often entirely lacking, their obsolescence being, in fact, a characteristic of the male larva. I noticed also that these tufts were obsolete in the females in proportion as the general surface was covered with the white or greenish-white secretion.

We have, therefore, but the differences Nos. 3 and 8 to seriously consider. As to the former, Maskell finds that the hairs in the larva of *sacchari* are "probably more numerous and certainly longer and thicker" than in *purchasi*. But all the range of difference mentioned is found in our species, according to the stage of growth and the sex. Your readers who have followed my description will remember that I separated the male larva in the second stage, not only by his narrower form, but by his longer and stouter legs and antennae, and by his body being more thickly clothed with the stout hairs than is the corresponding female stage. So that such differences have no specific value until stage with stage and sex with sex are strictly and accurately compared.

In this connection, let me state a fact not yet published, viz., that not only can the sexes in *Icerya* always be separated after the first molt (2d stage), as I have shown, but even from birth. In order to get at the differences, I had very large numbers of newly hatched larvae collected and mounted, and found that the male may be separated from the female even in this first stage by his smaller size, narrower, more elongate form, stouter femora, stouter terminal joint of antenna, longer anal bristles and longer hairs around margin of body. Finally, in reference to No. 8, or the number of circular spinnerets, this must also be a variable quantity, according to age and sex, as it is from these that the surface secretion arises, and in the rough sketch of their appearance in *sacchari*, which Mr. Maskell sent with his interesting communication, the proportion seemed wonderfully similar to those shown in the figure in my report of those of *purchasi*. (Pl. II, Fig. 6.)

For these several reasons my suspicion as to the specific identity of the two insects is yet as strong as ever, and will not be weakened until we know more of the sugar-cane form from Mauritius or Bourbon. I have taken steps to obtain material, and hope soon also to be able to study Signoret's material in person. In 1871 I was in correspondence with, and visited this veteran homopterist in reference to the identity of an insect (*Phylloxera vastatrix*) which, like *Icerya*, was of international importance, and which had also been described under different names. The settlement of what appeared at first a mere question of synonymy or a quibble between specialists, was one involving vast and material consequences, as history subsequently proved. It may turn out to be equally important in the case of *Icerya*. C. V. RILEY.

On board City of Rome, Aug. 18, 1887.

A NOVELTY IN DOOR KNOBS.—The newest thing in door knobs have a glass end, like a bull's-eye lantern, in which the number of the house is seen in black paint by day and black by night when the little lamp inside the knob is lighted.

THE STOCK YARD.

Colorado Stock-Women.

"I assure you," said a prominent cattleman to a representative of the Denver Republican the other day, "that of all the failures made in stock-raising in this Western country, not one of them has been made by women. You can say what you please about the gentler sex not being able to 'rustle' with the stern necessities of bread-getting, but you can trust the stock women, sir, to look after their own interests every time, and never, to my knowledge, has one of them been left. They are worth altogether several millions of dollars, and they have got the clearest heads and the best judgment as regards managing stock that I have ever seen displayed by anybody."

"No, sir, I never heard of a stock-woman failing in business yet, and I don't believe you ever did. They take their risks, of course, but not unadvisedly. They know what they are doing, and invariably make instead of lose. If you don't believe this you can consult all the stock journals in the country, and they will prove that what I say to you is true."

"Are you personally acquainted with many women engaged in the business of cattle-raising?" asked the reporter.

The cattleman gave a long, low whistle. "Well, I should think so," he said. "I've studied them for years. You want to know what kind of women they are? I'll tell you what sort they are, young man; they're ladies; that's what they are. Now, I don't mean by that that they would be afraid of soiling their hands if occasion required; no, indeed; nor of doing a charitable action which would necessitate some personal exposure on their part, for they are generous to a fault. What I mean to say is that they are, as a rule, refined and intelligent women, who read and think, and are capable of making a good appearance in society. I don't know as I have ever seen one of them who is phenomenally intellectual outside of the judgment they exercise in the stock business, which is phenomenal. Most of them have a genius for business, and nine-tenths of them know how to appear in a drawing-room."

"In most instances they are rich and know well how to use their money to advantage so as to get the most out of life. Many of them are wives and mothers, and when they are such I assure you they are both wise and kind. You will find that they rule their households with firm hands, and that their husbands and children, to use a biblical expression, 'rise up and call them blessed.'"

"I dare say you thought that women who engage in stock-raising were all centaurs. Come now, didn't you?" continued the cattleman. "Riding like the wind, half clad, their tresses flying behind them, and all the rest of it, for all the world like a picture from mythology. Confess now, didn't you?"

"I assure you, you could not have had a more erroneous impression. Stock-women are much like others, save that they have wider judgment on practical subjects. They are thoroughly business-like, because they appreciate the vast interest which they have at stake, and the quick conception with which all women are gifted enables them to see clearly what the inevitable results would be of one false move. They know that their decisions must be well weighted, that they must act only under the most careful consideration, and that once having acted they must abide by their decision with a calm, unswerving spirit. It is a good training school for a woman. It takes all that idiotic nonsense about nerves out of her and gives her brain a cool, common-sense poise which many a man might envy."

"I know of no position in life which I had rather my daughters would fill. It is one burdened with great responsibility, of course, but what mode of life is not where there is anything to be gained? I assure you I should not consider that a clear understanding of the cattle business interfered in any way with the refinement of those whom I hold most dear."

"But you have doubtless met stock-women of a directly opposite class, have you not?"

"Oh yes; there are necessarily exceptions to all rules. The uncouth woman of the ranch, who rounds up her own herds and sleeps in the saddle, is not altogether a creature of the imagination. Uncouth and ignorant she may be, but she is always a good woman, and one whom all the cowboys respect. I know several instances where these women can swing a lariat like a man and know quite as well how to manage the herd. A very few of them personally supervise their own animals, however, and these in most instances are those who have not as yet accumulated much wealth, although there are some very rich cattle-women in Colorado who ride after their own herds. This, however, is very unusual. A woman usually manages her cattle through a foreman, whom she often supplies with brain-power. She does not usually live on the ranch, but rather in a handsome house in some neighboring town. But all the same she is the bone and sinew of the business. Her clear head manages it all, and it is through her directions that her foreman always proceeds. She often spends the summer on the ranch, where a comfortable dwelling is fitted up for her, much on the order of an English shooting-box."

"You want to know something about the un-

married women who are great stock-raisers? Well, the main thing that can be said of them is, that men of position and prominence everywhere want to marry them, and not purely out of money considerations, either, for some of these unmarried stock-women have a fund of good sense and useful intelligence which cannot be eclipsed, and besides this many of them are quite accomplished and good looking. But few of them are 'on the marry.' Most of them are past their first youth, and they have a shrewd way of looking at things, which augurs ill for the stranger who looks with longing eyes upon their flocks and herds."

"Colorado women generally have gone into the stock business," concluded the cattleman, "through a direct line of inheritance—that is, they have inherited small herds, vast ones, or a taste and inclination for the life. I know of numerous instances where a father has died leaving his daughter a very small herd, and she has gone steadily on with it, making thousands where her father before her made hundreds of dollars. Again, there are widows who have come into possession of vast stock interests through the death of their husbands, and who have managed the business left to them until its receipts run way up in the millions."

"I know resolute women, too, who began without a dollar, and have gained wealth and standing in the stock business. The most highly novel sight I ever saw was a 14-year old girl herding cattle away up in Montana, with only her little brother to assist her. The father of these children had died, leaving them a small herd of cattle, and I would be willing to wager my last dollar that that little brown-skinned girl away up there in that wilderness will yet count her dollars by thousands. Of the 800 stock-women now doing business in Colorado, all are well and favorably known among cattle and sheepmen, any one of whom would gladly befriend them in case of an emergency, but whom, on the other hand, they are quite capable of advising in many practicable matters relating to stock-raising."

The Lifetime of Alfalfa.

We have often been asked, says the Denver Field and Farm, how long will alfalfa live and produce without being reseeded? We conclude that there is no one living who could answer the question with intelligence. It has lived on in the country from which we have obtained it through many generations of men, and nowhere in history can we find it has ever died out. We read that 300 years ago the Jesuits from Spain sailed the south seas, and as a precaution against starvation of shipwrecked mariners, planted alfalfa on the little barren islands of the ocean, and left a few pairs of goats—male and female—that they might eat this ever-living plant, and reproduce their kind, and possibly be the means by their flesh of saving human life.

We have knowledge of fields of this plant still flourishing near the ancient City of Pueblo that were planted in the days of Cortez, the invader. In talking on this subject with Col. Eli M. Wood of this city, he who traveled Old Mexico long before the reign of Santa Ana, we learned some interesting facts about the plant, and from one who has observed its growing for half a century. Said the Colonel: "I was in Chihuahua as early as 1844, and to feed my mules purchased alfalfa cropped from a field near the city. Forty years later—in 1884—I again returned to the country, and on seeing the same field fresh with that beautiful grass plant, I inquired of the proprietor—who was the same Castilian I had purchased the hay of in the olden time—if this had ever been reseeded or the land fertilized, and was told it had not. He informed me that from his best information the field had been planted by his ancestor 100 years prior to 1844."

In the grand valley of Taos, near the village of that name, is a small field of this plant growing that has yielded three crops per year for more than 100 years. We were informed by the proprietor of this Taos meadow, a few days since, that he had cut the grass from this field for 60 years, and he believed the crop of the present season was stouter than it had ever been before. Now from all these evidences, we conclude that the alfalfa is a never-dying plant.

KEEPING SWEET POTATOES.—The season of the year is now at hand when this crop will be ready to gather, and as it is still a debatable question as to the best method of keeping them, we give the following from a Georgia standpoint: "I have tried several methods of keeping sweet potatoes in the winter. The best of all is putting in old-fashioned banks or hills, filling the interstices between the potatoes with perfectly dry sand. Dig, if possible, in dry weather; if warm, do not cover too deeply at first, but as cold weather advances put dirt on freely."—Rural and Workman.

ELECTRIC RAILWAYS.—It will surprise many to learn that there are now running in this country 11 electric railways, equipped with 68 motors and motor cars. It is estimated that they are now carrying at the rate of three and one-half million passengers a year, and when the roads now under contract are completed twice that number will be carried.

VARNISH FOR HARNESS.—A good, black bright varnish for harness may be made by grinding "black" into a quick-drying body varnish.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

A Good Grange Day at Oakland.

Last Saturday Temescal Grange, by the assistance of a large delegation from Eden Grange, had another good Harvest Feast. After conferring the third and fourth degrees on Miss Lucy Blackwood of East Oakland and (by request of Eden Grange) Mrs. Capt. Armstrong of Hayward, Bro. Joel Russell, who was present with his son and Sister Russell, gave some leading remarks at the festive board. He spoke of the social and educational aims and purposes of the Order in an eloquent and impressive manner, not forgetting to show up not only the uselessness but the baneful influences of the drinking saloons in elections and their costliness to the general public. Farmers should certainly unitedly try to protect themselves from all abuses and nuisances which may threaten the welfare of themselves and their own families and those of coming generations.

Bro. Blackwood spoke of the necessity of farmers discussing and acting advisedly as concerning taxation, the protective tariff and other matters which will properly come before the State Grange. The woman suffrage question he thought would receive a good share of attention. Brother Blackwood was in favor of having all intelligent women who wished to vote do so.

Brother Goodenough kindly welcomed the new candidates to their new field of Grange work and spoke noble and encouraging words to both old and young members, urging all to strive faithfully on and persevere to the end and receive the reward that must surely come of good doings.

Brother Dennis recited one of his interesting incidents. Brother Kelsey gave some extended views on the tariff question. Brothers Perham, Renwick and Frink, and Sisters C. Deming of Vallejo, Kinney of the Girls' Union, Smith of Yuba City Grange, Babcock, Sheldon, Kelsey, Brooks, Blackwood and Dewey all assisted in making the after-dinner occasion a lively and exceedingly delightful literary repast. Sisters McGrew and Clara Deming MacLise, Past Pomona of the State Grange and members of Temescal Grange, were listened to with interest.

Brother Perkins was obliged to retire, saving, no doubt, for the State Grange or the next Harvest Feast a first rate speech.

Among other welcome visitors were the mother and sister of Sister Sharai, Secretary of Eden Grange.

The tables were, as usual, well and handsomely filled and beautifully decorated with floral offerings.

The absence of Brothers Webster and Bagge and families was mentioned with regret. The loss by death of Sister Heller, a charter member of Eden Grange, was alluded to with sincere sympathy by the Master of Temescal Grange.

Repairing to the Grange Hall, Sister Jessie Weed gave an interesting recital in a most eloquent manner. She was followed by a nice recital of a humorous poem by Sister Smith, a young member of Yuba City Grange.

Sister Roxy Dennis, receiving a hearty encore, favored the audience, by request, with a solo, "The Last Rose of Summer," accompanied by the organ, all seeming more than usually delighted with her successful efforts.

Several good speeches were made by different members which we wish could have been listened to by a larger number.

A resolution was adopted favoring the holding of the State Grange session of 1888 at Oakland, and requesting the representatives of Temescal and Eden Granges to confer on the matter with the representatives of neighboring Granges.

An application for membership was duly received and referred. Eden Grange holds another session to-day in which matters relating to the State Grange session will receive a large share of attention. Temescal Grange will hold its last meeting before the State Grange, Saturday evening, Oct. 1st.

Eden Grange has largely increased in membership and interest during the last year. Temescal has received but few new members, not being surrounded by a populous farming district. Its meetings, however, have usually been well attended, and its exercises quite interesting.

Last Saturday will be numbered among the bright and happy Grange days harmoniously enjoyed by the sister Granges of Alameda county. The wish was heartily expressed that all present should meet at Santa Rosa with many more of their fellow-Patrons from their own and other counties throughout the State.

National Grange, P. of H.

The following notice has been issued by the secretary of the National Grange:

WASHINGTON, D. C., Sept. 15, 1887.

In accordance with the provisions of its Constitution, and the resolution adopted at the session of 1886, the twenty-first session of the National Grange, Patrons of Husbandry, will be held in the city of Lansing, Michigan, com-

mencing on "the first Wednesday after the second Monday in November," 15th, at 11 o'clock A. M.

The sessions of the Grange will be held in Representative hall, in the State House, which has been kindly tendered by the Board of Control for the use of the National Grange.

Accommodations for the National Grange have been secured at the Lansing house, at the rate of \$1.75 per day each, where two occupy the same room, or \$2 where there is only one occupant, including the heating of rooms. By order of the Executive Committee.

JOHN TRIMBLE,
Secretary National Grange.

For Santa Rosa.

As the time for the next meeting of the State Grange draws nigh, the common question among members of the Grange is: "Are you going to Santa Rosa?"

It is six years this fall since the annual session of the State Grange was held in the charming "City of Roses." All who attended the session in 1881 will testify to the charms of Santa Rosa. It is but fair to say that during these six years she has grown wonderfully. In the way of public and private buildings, remarkable advances will be noticed. Street improvements will also be worth the special notice of all who may attend.

From all reports, Santa Rosa Grangers, assisted by the members of Sebastopol, Two Rock, and Bennett Valley Granges, are doing everything in their power to make the session a success, to render the visit of all Patrons enjoyable, and to see that the true worth of their respective localities is fully known.

Judging from the importance of the work that is to be done, there is every reason to expect a large attendance of Patrons. The election of officers of the State Grange for the term of two years ensuing is of itself a sufficient reason why every Subordinate Grange in the State should be represented.

There is no one thing of more importance to subordinate Granges than that a corps of competent, energetic officers, from the Worthy Master to the Lady Assistant Steward, should be selected. Let every subordinate Grange and its proper representatives remember this and attend at Santa Rosa and participate in everything that tends to the "Good of the Order." A careful selection of proper officers is a big start in another term of success.

The amendments to the Constitution of the State Grange are also of vital importance to the Order. Let them be considered carefully, and if adopted be adopted wisely. There are many other important subjects which will claim attention at the next session of the California State Grange, so remember and be at Santa Rosa Tuesday morning, Oct. 4th, at 10 A. M.

Buy your ticket via Donahue broad-gauge line to Santa Rosa and return. Pay \$2 for it. When at Santa Rosa be sure to have the ticket countersigned by E. W. Davis, otherwise it will not be good for return trip. The regular fare to Santa Rosa is \$1.75, but the Grangers get the round trip from San Francisco to Santa Rosa and return for \$2—a very liberal reduction. But be sure to ask for "Grangers' round-trip ticket," and then be sure to have it countersigned at Santa Rosa as above directed.

Good and Faithful Servants.

In an interview with a reporter for the Marysville Appeal, Dr. C. E. Stone, the newly chosen president of the Anti-Debris Association, said that the past management of its affairs had been in every way honorable and satisfactory. When a member of the Board of Supervisors, he thoroughly investigated the appropriations made by that body for anti-debris purposes, through the association, found all correct and so reported. The board, he says, is now owing the association for money expended for the county's benefit. He further says that the association has accomplished a great deal, and all that could be expected, considering the difficulties it has had to contend with, among which have been the suits to prevent the supervisors of Yuba from paying anti-debris bills. The county is now owing anti-debris claims to the amount of about \$10,000, and these should be paid without further delay.

Dr. Stone is as uncompromising as ever in his opposition to debris and debris dams.

In speaking of C. E. Sexey's many years of faithful and arduous service as president of the Anti-Debris Association, the Sutter Farmer says: "That he was honest and sincere, no respectable person ever doubted. He never received as much as a penny for his services and always contributed his full share in money when called upon. His chief abuse came from those who had never contributed anything.... Of his successor, Dr. Stone, it is but justice to say that he is the life-long friend of his predecessor; that he has been a member of the association from the beginning; that as a private citizen or Mayor of the city he has been an uncompromising enemy of hydraulic vandalism; that his integrity was never questioned, and that our knowledge of these facts has been obtained through 30 years' intimate acquaintance.... Our hydraulic enemies gave themselves liberty to vilify the late president in unmeasured terms; they are welcome to all the comfort derivable from the change."

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

THERE are some who believe the Grange is short-lived. On what ground do they rest their supposition? It contains the elements of endurance and permanency not found in organizations that have lived and flourished much longer. It is helped on and sustained, not by one member of the family, but by two and often by half-a-dozen, who feel that they owe to the Grange much of the happiness and prosperity which has attended them for the past five or ten years, and they would almost as soon think of giving up their homes as their Granges. We believe the founders of the Order built upon solid masonry with the hope and expectation of a grand and noble future, and to-day there is every indication that the Grange has come to stay, and with increasing years and experience will come increasing benefits to all. To make our Order perpetual, then, let us "strive to secure entire harmony, goodwill and vital brotherhood among ourselves."

—Grange Home.

QUESTION for discussion by Subordinate Granges: What is the full Grange meaning of the words, "noted for fidelity"? On opening the discussion of this question the Lecturer will please read to the Grange the obligations of the four degrees, the obligations of the officers and the Grange charter.

NEVER in the history of agriculture in Massachusetts and New England has there been such earnest and wide-spread interest in the Order of Patrons of Husbandry as right now. Farmers are beginning to realize that organization and co-operation alone can solve their problems and overcome the difficulties which beset them. Giant Monopoly on one side and Giant Labor on the other threaten between them to annihilate Giant Agriculture, who, more powerful than both together, slumbers on in blissful ignorance of his own strength and danger, and the farmers, their lands and their homes are in jeopardy. Besides many local questions of importance, there are national questions which command our attention and action. The Department of Agriculture should, at next session of Congress, be enlarged and rendered more useful and its chief made a Cabinet officer. Interstate commerce must be properly protected. The Agricultural Experiment Station appropriations are to be secured and carefully used in the interest of the tillers of the soil. The patent laws are unjust and need remodeling on the basis of fairness to innocent purchasers of patented articles. We must make progress in agricultural and industrial education. The great labor and liquor questions will not be settled by the cities. Brother, is there not work enough? We must have all the progressive agriculturists working with us.—A. A. Brigham, Mass.

REFORMS have been agitated in our legislative halls that in a short time must elevate our calling to an equality in the benefits of legislation with those enjoyed by other industries, and agriculture be made to flourish and acknowledged to be, as it really is, the most important of them all.—H. H. G., Virginia.

The central idea of the Grange seems to be the development of brains by friction of the wits. The founders of the Grange saw the error of farmers doing too much work. While disposed "to do good" as scripturally commanded, the last part of the sentence "and to communicate forget not" was unheeded, hence the farmers' isolation and loss of influence in the affairs of men. This is a condition the Granges aim to correct. At our district meetings the past winter, literary exercises have been the leading features, calling for much thought and action, many taking a part and contributing to their stock of ideas. None seemed to regret their attendance. These meetings break up the isolation of farmers and other members and lessen their dumbness in meeting. Also in the local Granges there is talent developed. Much could be said of the benefit of our meetings from a social standpoint, all of which goes to prove the proposition that the central idea of the Grange is the development of brains by friction of the wits.—B. F. R., Vermont.

PARTY ORGANIZATION is no doubt a very convenient thing, but a great many people feel—and I feel very strongly with them—that when loyalty to party means disloyalty to country, and means what it seems to me is still worse—disloyalty to conscience—it is asking more than any good man or citizen should concede.—James Russell Lowell.

Fourth Degree.

Let it be borne in mind that nearly all meetings of the State Grange are held in the fourth degree, and that all Matrons and husbands are not only privileged to be present, but are heartily invited to come at the beginning of the session and stay to the last. They will not only be well rewarded for their attendance at the session, but will leave with pleasant memories of the enterprising and hospitable citizens of the beautiful "City of Roses," the home of Past Master Coulter and family, Worthy Steward Davis and other well-known Sonoma county Grangers.

SACRAMENTO GRANGE holds its next regular meeting Saturday, Sept. 24th—the last day of the State Fair—and cordially invites all brothers and sisters visiting the Capital to meet with them on the occasion.

Anti-Debris Funds and Yuba Supervisors.

At a meeting of the Board of Supervisors for Yuba county, held in Marysville Saturday, Sept. 17th, a communication in the shape of preamble and resolution was read, as follows:

WHEREAS, The Anti-Debris Association of the Sacramento Valley, through its Board of Directors and officers, have, at their own expense and out of the funds of the association, carried the anti-debris litigation to a successful issue so far as law and injunctions are concerned, and have also expended large sums in the enforcement of the law; and

Whereas, The Boards of Supervisors of the several complaining counties have from time to time paid from the county funds to the Board of Directors of this association;

Resolved, That it is of the greatest importance to the valley interests that we should know whether your honorable body desire to continue the policy heretofore pursued, or whether you wish all litigation should cease. An immediate reply to this communication is very respectfully requested, as, in our opinion, matters of such very grave concern need early attention, either from your honorable body or from this association.

C. E. STONE,
President of the Anti-Debris Association.

B. T. Walton, secretary, read other communications with reference to outstanding anti-debris claims against the county for counsel fees and other expenses for litigation, aggregating about \$10,000. No action was taken in the matter, consideration of which was postponed till the October session. Two supervisors from the mountain districts oppose payment of any anti-debris claim, but those of the valley portion of the county, including Marysville, are united with the Anti Debris Association.

AGRICULTURAL NOTES.

CALIFORNIA.

Amador.

WATERMELONS.—Jackson Dispatch: A fine specimen of a watermelon of the Cuban Queen variety, raised on Mr. Chapman's ranch, about four miles above town, weighing 47 pounds, was left in our office yesterday, and we were shown others of the same variety which weighed more. But it is not the size of the melon that we wish to brag on so much as the flavor, which is much superior to that of similar articles produced in the valleys.

Colusa.

ORGANIZED UNDER THE WRIGHT LAW.—Orland telegram, Sept. 11: The election in the Orland irrigation district yesterday was warmly contested by a few anti-irrigationists. The vote was 29 for and 13 against. This organized the district and elected the officers. The people are joyous over the result. This opens about 14,000 acres of good land to water, which has previously been confined to the production of wheat. This is the first district organized under the Wright Act in Northern California, and much interest has been taken in the matter all over the county. It is thought that other districts will now be formed.

Contra Costa.

GIANT SUNFLOWERS.—Antioch Ledger: S. P. 'age has a row of giant sunflowers growing in his yard, which were raised from seed received from the Agricultural Bureau at Washington. Several have attained a height of 15 feet, and none are less than 12. The flowers that vainly endeavor to turn their heavy heads to follow the sun are from 10 to 15 inches in diameter.

El Dorado.

RESISTING ROOST-HOBBER.—Bee: Mrs. Orr, who resides near Salmon Falls, in El Dorado county, has had a number of her chickens stolen recently. Her husband was not at home, and thieves took advantage of the occasion and raided Mrs. Orr's hen-roost several times. She grew tired of this, and a few nights ago stood guard near the chicken-house, armed with a shotgun. She saw two men in the act of tampering with the fowls on the roost, and fired the contents of one barrel into the legs of the man in front. The shot was small and the man got away. He is not likely to interfere with Mrs. Orr's chickens again.

Fresno.

MONEY IN PEACHES.—Republican: A. C. Brayn has a 20-acre tract in Washington Colony, set mostly to peaches and nectarines. The trees are nearly all young, and therefore not in full bearing. He has 54 Early Crawford peach trees, now five years old. This season he picked 10,800 pounds of fruit from these 54 trees, and sold the same to Geo. W. Meade & Co. at 1½ cents per pound—\$135, or an average of \$2.50 per tree. These trees occupy just one-half an acre of ground, are good average trees, have been properly taken care of and give an unequivocal affirmative answer to the oft-repeated question, "Does fruit-growing pay in Fresno county?" At the rate of \$270 per acre, there is a net profit to the orchardist of about \$240 per acre.

Lassen.

HEREFORDS FOR THE FAIR.—Susanville Mail: B. A. Bell, agent for Albert Gallatin, has six head of Hereford cattle at John Masten's ranch, which he proposes to exhibit at the exhibition to be held at Susanville in October. The herd consists of the bulls "Earl of March" and "Horace 22d," two sons, half-breeds, of the "Earl of March," and two heifers, sired by "Horace 22d." The bulls were raised by

the New Zealand Stock & Pedigree Co. The cattle at Masten's have had no particular care, but fared the same as other range cattle. Their condition shows the wonderful hardiness of the breed.

Los Angeles.

FRUIT-GROWING AT CRESCENTA CANYADA.—The *Herald* acknowledges the receipt of some choice fruit raised by General J. H. Shields of Crescenta Canyada. It consists of late Crawford peaches, second crop early York peaches, and a cluster of 16 white figs. Heretofore the General's fig trees have borne but three figs to the cluster, but this year he pruned off about six inches from the ends of the limbs, and was rewarded with an immense increase of fruit. His Hale's early peaches have produced two crops, and his apple trees, now loaded with fruit, are blooming for a second crop. The fruit is very fine. The General attributes the production of two crops to the fact that the trees are so far removed from surface water, with its attendant coolness, that the warm soil stimulates growth and production of fruit. It may be that the warm uplands will make deciduous fruit trees into evergreens.

Marin.

TALL DAHLIAS.—San Rafael *Journal*: County Clerk Bonneau is a floral connoisseur, as his beautiful garden attests. Among his especial pets are some lovely dahlias, which bend their proud necks and look down upon you from a height of 111 inches.

NOVATO APPLES ABROAD.—A large consignment of choice apples will be sent out from this place to Australia by the next steamer. The fruit is carefully assorted and packed with such care that it makes the long voyage of over 7000 miles via Honolulu, Auckland and Sydney, crosses the equator and reaches its destination in excellent condition.

OSTRICHES.—San Rafael telegram, Sept. 15: Stone & Knapp have leased the Austin ranch for ostrich farming, and have arrived with their herd of ostriches. Ostrich farming will be carried on extensively here.

Modoc.

LIVE-STOCK IN THE COUNTY.—The Adin *Argus* has been furnished by the assessor with an itemized list of Modoc's cattle, horses, etc. The total valuation is \$871,060. The list includes 11 thoroughbred horses, value, \$2750; 1683 American horses, \$89,945; 6889 graded horses, \$203,531; 2185 colts, \$30,845; 539 mules, \$19,577; 105 oxen, \$2410; 20,438 sheep, \$30,832; 647 beef cattle, \$12,799; 10,702 calves, \$85,467; 24,551 stock cattle, \$349,693; 110 fine cattle, \$4400; 1790 cows, \$35,283; 2830 hogs, \$3558.

HAY AND PASTURE.—*Shasta Courier*: Modoc raises more hay on an average, to the acre, than any other county in the State. It is the best county for stock-raising and pasturage in Northern California, as well as good for general farming.

Nevada.

PEAR PROFITS.—*Transcript*: John Ducray picked and marketed 1500 pounds of pears from two trees growing in his "bedrock" garden at Nevada City. Mr. Peabody, living near the railway in Grass Valley township, picked 1200 pounds of Bartlett pears from three trees, the trees growing in uncultivated ground and having been untrimmed or cared for for several years. John Rodda, nurseryman at Grass Valley, marketed last year 26 boxes of pears from a single tree 12 years old, the boxes weighing 40 pounds each. Felix Gillet sold \$11 worth of pears from a single Clairgeau pear tree last year. The tree is less than 15 years old and is growing in his Barren Hill nursery. E. Booth sold 130 boxes of pears from 18 trees growing in his orchard at Nevada, a majority of the trees being small and having only recently commenced bearing. The largest yield was 900 pounds from a tree 12 years old, the average of all the trees, large and small, being 350 pounds of pears to each tree. These pears were sold at 1½ cents per lb. on the tree, and the owner received \$2.50 per day for picking the fruit in addition to that amount, receiving his money as soon as the fruit was ready for shipment.

SOME PUMPKINS.—North San Juan *Times*, Sept. 16: The other day we shipped for exhibition at the State Fair a pumpkin which was raised in the garden of John German, and which weighed 153 pounds. On the same day a squash raised on the ranch of Henry Wichman, less than a mile from town, was shipped, which weighed 185 pounds.

Sacramento.

IRRIGATION ENTERPRISE.—Sac. cor. *Bulletin*: A new water company has been organized to take water from the American river to irrigate a large portion of the lands in Sacramento county. Three surveys are being made from points on the river; one to take water out at Folsom, another one and one-half miles below, and a third to take water out four miles below. The papers filed claim 80,000 inches—the canal to be 50 feet wide on top and seven deep. The Assistant State Engineer is making the survey. It is intended to run the canal so as to divide between the American and Cosumnes rivers, and follow down the divide, covering an immense area. Albert Gallatin and Judge Denison have charge of the matter.

San Bernardino.

CANNING AND DRYING.—Lugonia *Citrograph*, Sept. 17: The Colton cannery is running to its utmost capacity, handling about 15 tons of fruit daily. Pears and peaches are the staples

now. Over 250 hands are employed. The output for the season is estimated at 20,000 cases of canned goods and 40 tons of dried fruit. Lots of fruit from this section has been hauled 10 miles to this cannery because there was no market nearer home.

REDLANDS FRUIT ACREAGE.—We have been at the trouble of getting the figures regarding the area of land in the east San Bernardino valley set out in deciduous trees, orange and lemon trees and grape vines. The figures are very nearly correct and may be relied upon:

	Acres.
Apricots.....	541
Peaches.....	1028
Nectarines.....	15
Pears.....	25
Raisin grapes.....	510
Wine.....	375
Olive.....	12
Prunes.....	4
Figs.....	18
Walnuts.....	23
Oranges.....	499
Lemons.....	7

Total..... 3057

To this must be added the acres upon acres of young trees recently set out and not yet in bearing. The locality embraces all that country lying this side of the Santa Ana river, and all naturally tributary to a cannery here were one in operation.

FINE BANANAS.—San Bernardino *Index*, Sept. 17: Specimens of bananas grown by G. W. Beattie at East Highlands, in this county, are of good size and of fine flavor, and in the latter respect superior to any California-grown we have ever tasted. It is the best evidence we have yet seen of the wonderful fitness of our climate for the cultivation of semi-tropical fruits.

San Joaquin.

PREPARING FOR THE FAIR.—Stockton *Independent*: The directors of the Agricultural Society have had a large force of men employed at the park for several weeks past, putting everything in shape for the fair, which opens next Monday. The stables have been renovated and a large force of active whitewashers is now engaged in giving the place a neat appearance. Forage for stock is being delivered and a large sprinkling wagon drawn by four horses is kept on the streets leading to the entrance to the park. The track is in first-class order, and will be fixed for fast records when the fair opens. The demand for stable-room this year will exceed that of any previous year, but the directors have made provision to accommodate more stock than was ever shown here before. Cattle stalls east of the racing stables have been increased in number, and the row of stalls at the southeast corner of the grounds have been cleaned and made ready for cattle to be exhibited. The society furnishes forage free to all stock exhibited and entered in races, and the expense is very heavy. The State Society has placed a limit on the amount used daily at Sacramento, as follows: Cattle, 20 pounds per head; horses, 20 pounds per head; sheep, three pounds per head; show stock, one bale straw; racing stock, two bales straw. Here there will be no limit on the amount furnished, notwithstanding the fact that good hay is selling at \$14 per ton.

San Luis Obispo.

CROPS.—Thrashing is regarded as finished in San Luis Obispo county, being a month earlier than usual, which indicates a light crop. Wheat is of good quality and the yield on the coast about the same as last year, and in the interior half that of last year. Of barley the yield is more than last year. No wheat rusted, as it often does in very wet winters. The product of the county is about 350,000 centals of wheat. The bean crop is larger than last year and of excellent quality.

Santa Barbara.

FALL CLIP.—Santa Barbara *Press*: Sheep-shearing will begin on the Santa Cruz islands about the 25th of this month. An extra good yield is expected, as the season has been favorable.

A ROYAL IMMIGRANT.—She is one of the blue bloods of nobility, with such monarchs of ancestry as Exile of St. Lambert, Stoke Pogis 3d, Lord Lisgar, Victor Hugo, Bismarck and Jerry, and such queens as Fann of St. Ida, Allie and Anne of St. Lambert and Jersey Bell of Scituate. Her granddam Allie and her full sister Ida are the two largest officially tested butter and milk cows in the world. She and her offspring will make their future home with the Pioneer herd Jerseys of E. J. Packard.

HORTICULTURAL SOCIETY.—*Press*: The September meeting of the Santa Barbara Horticultural society was held at Burton Mound. There was not a very large attendance, but the order of business was preceded by a fine lunch. The general discussion on fruits elicited the fact that the yield this year was unusually large, and that apricots were among the best products of the orchard. The question of establishing a fruit-drier was debated at length. If built at Carpinteria, and properly managed it was thought it would yield a good profit. After the freights have been paid, there remains such a small profit to the farmer that he realizes very little for his time and labor, consequently tons of fruits go to waste yearly. An exhibit of grapes by Mr. Cadwell was very good. The scale-bug received some attention from Mr. Harper. Walnut production in this county was discussed at length by Mr. Opdyke and several other members.

It was decided not to hold a horticultural exhibit this fall as a society, but the members were asked to take part in the county fair. A new set of by-laws were adopted and the following members were elected directors: H. C. Ford, O. N. Cadwell, Edward Harper, S. L. James, Jos. Sexton, P. C. Higgins. After the meeting adjourned the Board of Directors met and elected the following officers: H. C. Ford, President; P. C. Higgins, Vice-President; John Spence, Secretary; Edward Harper, Treasurer.

Santa Clara.

CHAMPION PEACH-PICKERS.—San Jose *Mercury*, Sept. 17: N. Lee and E. M. Mott, whose ages average 61 years, picked in one day, for H. L. Woodburn, in the Willows, 164 40 lb. boxes of peaches. The peaches weighed over three and a quarter tons, and sold for \$100. Now let us hear from the boys.

Sonoma.

FOREST FIRES.—*Argus*, Sept. 17: Monday and Tuesday were exceedingly hot in Petaluma. It was occasioned by extensive forest fires in the neighborhood of Freestone. The lands of Hegelar, Crayne and Shuster were badly damaged. Several miles of fencing, hay, grain, feed and timber, standing and cut, have been destroyed.

GRAPES AND HOPS.—Healdsburg dispatch, Sept. 18: Picking of the hop crop is completed in the valley of the Russian river. The crop is of excellent quality and an average one. Grape-picking commences to-morrow. The vintage will be larger than at any previous harvest, from the fact of increase of bearing vines. The grapes are of good quality, and the crop will be an average one.

Stanislaus.

PROPOSED CANAL.—Modesto telegram, Sept. 16: The Board of Directors of the Turlock Irrigation District, at a meeting to-day, received estimates for a canal and distribution ditches for that district, from Engineer Manuel, under the provisions of the Wright bill. A call for an election to vote \$600,000 for the works has been issued. The election takes place Saturday, October 8th. The proposed tax is about \$3.30 per acre in the district, and the election will probably be carried by a very large majority.

Tehama.

BEARDESS BARLEY.—J. M. Howell in Red Bluff *Cause*, Sept. 17: Three years ago I received three sacks of this barley from a friend at Modesto, and have found it very profitable and valuable. 1st—I find it will produce full as much to the acre, if not more, than the bearded varieties, to winter sown; and I find it equally good for summer-fallow. 2d—I find it makes the best hay. 3d—The straw alone is nearly equal to hay on account of having no beard. 4th—It makes the best hog feed of any grain; and hogs will leave a wheatfield to feed on it, as the grain is soft and free from husks. 5th—I find it the best barley when you feed whole grain, for there is no beard to annoy stock. 6th—I find the stubble the most valuable pasture of all my stubble-fields, for the straw is soft, and there is neither beard nor chaff to bother or punish your stock.

COTTON.—Red Bluff *Sentinel*, Sept. 10: Last spring S. Doane of this place found a few cotton seeds and gave them to his children, who planted them in the rear of his residence. No attention was given the young plants except to put water on them occasionally. Sunday Mr. Doane showed us as fine cotton from the young plant as any one would wish to see. The plants are thrifty, and the pods large and well filled with fine cotton.

Yolo.

SIX WEEKS' RUN.—Woodland *Democrat*, Sept. 15: Geo. Dinadale this week concluded the season's run with his thrasher. He has, doubtless, had the longest run of any machine man in the county, 71 days. For the first 50 days the average was over 1200 sacks per day. The last 20 days the machine was engaged in tulle grain, where the yield was lighter. During the 70 days only two members of the original crew were displaced, which is saying a great deal for the employer and the employees.

FIGS BY THE TON.—One of the largest fig orchards in California is that of Wm. Russell, four miles north of Winters. It comprises 22 acres, and contains 1000 fig trees, all in bearing. Mr. Russell shipped 15 tons of dried figs last year, besides many more tons of green figs to the S. F. market. Most of the trees were planted in 1884.

Yuba.

BEARING BANANA.—J. G. Cohn, in Marysville *Appeal*, Sept. 16: I have been experimenting in the growth of a fruit that is not accustomed to this climate, and, after six years, have the satisfaction of seeing a bearing banana tree in the yard of my residence on D and Fifth streets. People, when I planted it, said that I was crazy; but by the first of next December, when I take down the bunch, they will see that my notions that bananas could be grown here were correct.

SMARTSVILLE ENTERPRISES.—Wheatland *Graphic*: The Excelsior Water and Mining Co. seem to have turned their attention from mining to farming, stock-raising and fruit-growing. Their 40-acre peach orchard, planted in the spring of 1885, has made an astonishing growth, and stands to-day heavily laden with luscious fruit, a living evidence of the superiority of our foothill soil and climate for fruit-raising. The company has a large supply of

water, and dug about nine miles of ditch last winter. They will probably extend the same the coming season to convey water on all the places north and west of Wheatland. What a transformation to contemplate! Our sheep ranges and wheat-fields turned into alfalfa meadows, orchards and vineyards. As an illustration of what may be done by irrigation, we noticed that Daniel McGanney was preparing to cut his fourth crop of alfalfa for this year, from a 60-acre field on the sidehill, about three miles south of Smartsville.

FOREST FIRES.—Marysville, Sept. 13.—Word has just reached here that forest fires have been raging near the Oregon house, about 30 miles northeast of here, for two days, but are now under control. Two houses, many miles of brush fence and a number of head of live-stock have been burned.

WHEATLAND CROPS.—C. J. Ripley brought up from Wheatland last evening some specimens of corn, 12 feet high, from Kelsor's ranch. A corn crop is growing there from seed planted June 15th, after a crop of four tons of hay to the acre had been cut. The corn will grow 80 bushels to the acre. Mr. Ripley reports the hop crop in fine condition. A yield of a ton to the acre is anticipated. On alfalfa land the fourth crop of hay this season has been cut.

NEVADA.

EDITORS PRESS.—Fifteen miles east of Paradise valley, the Jordan Valley Stock Co. have 10,000 acres of land—1500 acres of it being meadow and 250 acres in alfalfa, with an irrigating ditch 20 miles in length. They have 6000 head of cattle, including some white-faced imported Herefords; also 200 head of horses, including four fine stallions of Norman and Hambletonian breed. There is a nice vegetable garden on the place. I was shown one Centennial potato which weighed three pounds. One thousand tons of hay have been cut this year, but water has been scarce. Mr. H. G. Pratt is superintendent of the place and has erected a fine two-story stone building with 12 rooms. Five miles northeast of Paradise valley and just as you enter it, with the Santa Rosa mountains on your north and west, is S. B. Pierce's place. Mr. P. has a flour mill run by water power, with a capacity of turning out 50 bbls. in 24 hours. He has a two-acre orchard in apples, plums, pears and cherries, and 30 acres in alfalfa.—W. J. F., Sept. 18, 1887.

WOOL-GROWERS' ASSOCIATION.—Winnemucca dispatch, Sept. 18: The Nevada, Eastern Oregon and Idaho Wool-growers' Association closed its annual meeting here last night. There was a large attendance and the following officers were elected: President, Thomas Nelson; Vice-President, Charles McConnell; Secretary, George Turritin; Treasurer, L. A. Blakslee.

NEW MEXICO.

FRUITS OF THE TERRITORY.—Dispatch from Albuquerque, Sept. 13: The first annual exhibition of the Southern New Mexico Association opened to-day at Las Cruces and will last three days. The principal feature is the fruit exhibit, the production alone of Southern New Mexico, which, it is claimed, is not excelled by the far-famed fruit regions of California. Word from Las Cruces states that the opening was attended by an immense crowd, far in excess of the management's expectations.

The Advancement of Science.

The American Association for the Advancement of Science, which recently met in New York, numbered 721 persons present, of whom 321 were new—the largest meeting for several years. The papers offered were 272 in number, of which 256 were read before the several sections, of which there were eight.

One of the most useful and practical papers read was by Prof. W. O. Atwater, on the "Physiological and Pecuniary Economy of Food." This paper called for nearly a whole day's discussion. He said, in substance, that the cheapest food is what furnishes nutrition at the least cost; while the most economical food is what is both cheapest and best adapted to the wants of the user. Vegetable foods are, as a rule, less costly than animal foods, but not so richly nutritive. Flour is cheaper than potatoes, because the protein in the latter is inferior and less digestible. The worst form of American wastefulness is the waste of beef, lamb, veal, fish, flour and potatoes, fruit, and other kinds of food, and this is chargeable both on the rich and the poor. People buy more than is needed, and eat more than can be digested. Much of the excess is actually thrown away. Costly materials are used where less expensive ones would do as well. False economy is practiced in buying what seems to be cheap, but is really dear. Add to this the evils of wrong selection in marketing, careless keeping, bad cooking, and unskillful using in the home, and it will be seen that the financial loss is very great. The physiological waste is still greater. More harm is done by unwise eating and drinking than can be estimated. The rich suffer both in health and in purse, but the poor suffer most of all. The food of the wage classes is large in amount and costly in kind. The German standard calls for 118 grains of nutritive ingredients *per diem*, whereas the American workman consumes from 95 to 254 grains. But, on the other hand, the latter can do more work, and his superior capacity is largely due to his better nourishment.

Things That Never Die.

The pure, the bright, the beautiful,
That stirred our hearts in youth;
The impulse of a worldless prayer,
The dream of love and truth,
The longing after something lost,
The spirit's yearning cry,
The striving after better hopes—
These things shall never die.

The timid hand stretched forth to aid,
A brother in his need;
The kindly word in grief's dark hour,
That proved a friend indeed;
The plea for mercy softly breathed,
When justice threatens nigh,
The sorrowings of a contrite heart—
These things shall never die.

Let nothing pass, for every hand
Must find some work to do;
Lose not a chance to awaken love;
Be firm and just and true;
So shall a light that cannot fade
Beam on thee from on high,
And angel voices say to thee—
"These things can never die."

—Victorian Freemason.

The Love Cure.

"Aunt Emily, that girl will be the death of me."

The speaker, who had raised himself to a sitting position to deliver the energetic protest, sank back upon a lounge with a sigh of utter exhaustion.

The room, shaded from the summer sun by window awnings, expensively furnished, and speaking of invalidism in every detail, was painfully quiet, but from an apartment not far away came the sound of a rich contralto voice, indulging in the most astounding gymnastics of which the human voice can be supposed capable; while rapid fingering upon the key-board supported the vocal acrobatic feats. What the original air might have been could hardly be surmised, in the right scales, trills, cadenzas, and flourishes with which it was embellished. Suddenly a sweeping rush of notes, a crash of chords, and the piano lid fell with a bang that startled the speech above quoted from Craig Warrington. Aunt Emily, Mrs. John Chester, a blue-eyed widow, with one idol, her nephew, sighed, as she answered:

"She is a great trial, Craig! But we must endure it for a month or two."

"Down the burn, Davy, love!" floated in the open window, and in a moment a tall, handsome girl of seventeen came up the porch steps, having made a circuit of the house from the drawing-room window.

"Dear," said Mrs. Chester, holding up a warning finger, "do try to be a little quieter; your cousin is very nervous this morning."

"The idea of a man not 24 having any nerves," said Helen Warrington, putting aside the lace curtains to step into the room. "Poor little fellow!" she added in a soothing tone, approaching the lounge, "did it want to be quiet?"

Craig flushed under the keen sarcasm of the great black eyes looking down upon his tall figure, but said, rather fretfully:

"People in rude health have no idea of the sufferings of invalids."

"I suppose it is shockingly vulgar to have no aches or pains," was the reply, "but refined laziness was never my temptation."

"My dear, sickness is not business," exclaimed Mrs. Chester.

"No—but—"

That was all; but again Craig flushed under the scrutiny of the dark eyes.

A grating of wheels upon the gravel, and a voice calling Nellie, caused Miss Warrington to dash through the open window again, and in another moment she was standing beside a buggy in which was seated an elderly gentleman.

"One more drive, Nell?" he asked.

"Wait until I get a hat, papa."

She was seated beside him a moment later, her face very grave.

"What have you been doing?" her father asked.

"Singing to keep from crying; it is so hard to let you go."

"I know it, Nell; but it is my duty; your poor aunt is certainly alone in Nice, and some one must go to her. I will return as soon as possible. In the meantime this is a pleasant home."

"Pleasant!" the girl cried, with an expressive grimace. "Papa, you are a doctor; tell me if my cousin Craig is really sick."

"Yes, and no."

"I thought as much."

"He is certainly delicate, and both his parents died very young. But he pets his ailments till from dwarfs they become giants. If Craig were a poor man he would probably overcome all his weaknesses. As a rich man, he will probably die in a few years, of sheer want

of exercise and purpose. He is a dyspeptic from lying about on beds and lounges instead of walking and riding. He takes cold by keeping himself ever in an artificial atmosphere."

"And he has nerves," said Nellie contemptuously.

"Unfortunately he has, keenly sensitive ones," was the grave reply, "with only self-indulgence to foster all their vagaries. Understand me, Nell, your cousin does suffer more than you can realize, and he will suffer more and more as he encourages his troubles."

"Wants shaking up?"

"Exactly, mentally and physically."

"One thing is certain," said Nell; "either he or I will die before you return. I feel smothered every time I go into the sitting-room, and he groans every time I raise my voice above a whisper. It is too bad, papa, to see him so. I think he is the very handsomest man I ever saw, and he converses well, too."

"A fine fellow," the doctor replied, with a quizzical look Nellieward, but unobserved; "but I want to talk about you, now. While I am gone—"

And the doctor began a long string of directions for this, his only child, he was leaving for the first time in her life. It was bitter work for both, but they had made duty and self-sacrifice watchwords for so long, and there was no hesitation when these called for separation. Dr. Warrington's sister, widowed at Nice, was ill, and her brother had been summoned to bring her home. In the time of his absence Mrs. Chester had consented to give Nellie a home.

It roused Craig Warrington's chivalry the following morning to see the still, white face Helen turned from the last look at the carriage taking her father to the depot to start for New York. For a moment Mrs. Chester thought the girl would faint, but she rallied, saying with a dreary smile:

"We were never separated before. But I promised papa not to fret. But he lets me help him. When I left school a year ago, he had teachers for music and language come to the house for two hours every day. The rest of the time I work for papa. I have a ward in the children's hospital under my care, and I sew for the patients, and keep the laboratory of that ward in order."

"Keep it in order?" questioned Mrs. Chester.

"See that the medicine bottles are always filled, bandages rolled in the drawers, lint scraped, sticking plasters ready, the instruments at hand, and everything in order for instant use. In case of an accident, life may hang on one second for promptness or delay. Papa has taught me how to act in emergencies before physicians or surgeons can be summoned."

"A female doctor," said Craig, with a suppressed sneer in his tone.

"No, Cousin Craig; but, I hope, an efficient nurse. I have no desire to step out of woman's true sphere, or to usurp any of the duties and privileges of a man; but I try to do faithfully such duty as lies under my hand. We are very rich, as you know, and papa is training me to fill a noble, useful place in the world as far as I can."

"Forgive me," said Craig, frankly; "I was rude."

Helen bowed gravely, and walked out of the room to visit one or two of the village patients her father had left under her care. And Craig half pettishly wondered why her words had left such a sting. He was rich, too; but what human being was the better for any noble use of his wealth? His home was luxurious, and the most elaborate of invalid devices were arranged in his bedroom and sitting-room, but he could find no comfort that morning. His easy-chair might have been full of thorns for any ease he found there; his novel had lost its interest, and his nap was an impossibility.

"Craig!" his aunt cried, aghast, half an hour later, "you are surely not going out in the broiling sun?"

"Only for a walk to the village."

"But you can send Tom for anything you want."

"I will not walk far."

The sun was hot, and Craig was not strong, in spite of his tall figure and broad chest. Very soon he felt that he must either sit down or fall down, and, very pale, he entered a little porch and sat upon a seat there. When the first dizzy sensation was over, he heard a familiar voice on the other side of the window beside which he sat.

"Remember," the voice said—and Craig wondered at its low, sweet tone—"you are to make no exertion for the present. I have engaged Mrs. Riley to come here and do all the work and care for you. When you are quite strong again I will see that you have sewing to do."

"God bless you, miss! Your father and yourself are the true Christians!"

A rustle at the door, and Craig saw Nellie looking at him with such utter astonishment that her face was actually ludicrous.

"I came here to escort you home," he said, "and the heat was too much for me."

He was still deadly pale; but Nellie, stepping back to the house, returned with her handkerchief dripping with cold water, to lay it upon his head.

"You had better postpone your next walk till after sunset," she said, dryly; "meantime wait here and I will go for the buggy."

"No; I will walk back."

Nellie's ample sun-umbrella was a help on the return walk; but Craig fully justified his aunt's fears by the condition in which he

entered the house. Nell pelted him with sarcastic inquiries, all the time keeping cold water on his head, and otherwise taking such precautions as seemed best against injurious effects.

"You see what a useless animal I am," he said to her.

"I see that you chose a wrong time to walk after living in this cell all summer," was the reply. "This room is like a vault. I should die here."

"But you are strong."

"Very true. And I keep strong by activity and plenty of fresh air. If I took a drug shop every day I am not sure I should live a week. 'Three times a day,' she read, taking up one bottle. 'After each meal,' was on another. 'At bedtime,' a third directed. 'Do you know, Craig, my whole ward in the children's hospital would not puzzle me so much as keeping track of that table of bottles.'

"But I cannot sleep or eat without medicine."

"Poor fellow!"

Craig winced; Nell had an inflection on those two words that cut him to the quick.

He saw very little of her during the next week. Dr. Warrington, rightly judging that work was the best cure for loneliness, had hunted up a few cases during his week's stay in the village where Nell could minister to the sufferings caused by overwork and poverty, and Nell, missing her daily labors in the hospital, entered heart and soul into the field of duty. The first cases led to others, and home hours were taken up with sewing for some of the poorest of the children.

But in the intervals of work Nell took a mischievous delight in upsetting Craig's nervous system. She sang only her most dashing bravuras at the hours of noonday repose. She stole bottles of tonic and filled them with molasses and water. She made bread pills and put them upon the tray of dainty food especially prepared for the patient's delicate appetite. She put red pepper in the eau-de-cologne, pins in the lounge pillows, and paste on the afghan. She roused Craig to energy, if only to protest that she was the plague of his life.

He tried to save his conscience by offering Nell money for the proteges, and she told him brusquely that she had all she wanted.

Letters from Nice informed Nellie that her aunt was far too ill to return home, and after two months' death released her; and Dr. Warrington, being in the city once more, sent for his daughter.

A sudden dismay seized Craig. For the first time he realized how much of sunshine Nell would carry with her. He studied it well, and, to his cousin's unbounded astonishment, made her an offer of marriage.

"Thank you," she said, shortly. "I do not fancy home hospitals." Then, seeing the pained face, she added more gently: "When I marry, Craig, my husband will be a man doing a man's work, not a miserable hypochondriac, whining out his life upon a sofa."

It was caustic medicine, and Craig rejected it at first, but as the days wore on, the sting, ranking deeper, touched chords of conscience, and Craig Warrington roused himself to self-communing that was bitter but wholesome. It was not easy to cast off habits that were lifelong, fostered by some actual surgery, encouraged by his aunt, and most assuredly not discouraged by the village physician drawing a yearly income therefrom.

Nell's astonishment reached a climax at the new year, when Craig Warrington walked into the room where her father was giving her a lesson in practical chemistry.

"Uncle Rolf," Craig said, "Nell objects to home hospitals, but I have come to you professionally."

"My dear boy, what can I do for you? Look out, Nell; if you mix those acids we will have an explosion."

"To avert which calamity I will retire while Craig tells you his new ailments. Poor fellow!"

She flashed away, and Craig, looking after her, said:

"Uncle Rolf, I love Nellie!"

"Dear me! I thought she tormented you to the verge of insanity."

"So she does. Nevertheless I want her for my wife. She objects to nerves, so I have come to get rid of mine. Seriously, Uncle Rolf, I want you to take me for your patient, and see if there is stuff in me for a man useful and honorable, a man in short, that you will not reject for a son-in-law if Nell will have me."

"With all my heart!"

Nell was saucy and sarcastic when Dr. Warrington told her Craig was to be their guest, and yet the invalid knew that she gave him sweetest encouragement in a thousand ways. It was a hard task to follow Dr. Warrington's rule, and Craig might have often fainted by the way only Nellie was there to see, to rouse him by her wit, or by her gentleness to help him on.

With physical strength came a mental health, a desire to be up and doing in the world's work. Wealth, seen through this healthier medicine, was ennobled as a means of usefulness, and even labor became honorable where there was good to be wrought out.

It aroused Nell's respect first to see how selfishness was trodden down, how actual physical pain and weakness were conquered by resolution. And where Nell's respect was given, her heart followed, till she bent her proud, saucy head and owned her master.

"But if I marry you," said she, half laughing, "I may be the death of you as you feared."

"Not now; it will kill or cure; and I think I am cured."

And Dr. Warrington finds in his life works of charity and usefulness an active helper not only in the child his love trained to the duty, but in Craig, his son-in-law.

The Old Home Revisited.

A sharp-nosed, poverty-stricken "tender-foot" from a worn-out "red hillside" in an Eastern State, concluded a few years ago to "go out West" and try his fortune.

He came to Los Angeles, got thawed out in our golden sunlight, fattened on our "grapes of Eschol," amassed a fortune by investing in "gilt-edge real estate," had his "youth renewed like the eagle's" by quaffing of our perennial fountains of health, and then, being of those who would be discontented in heaven, concluded that he had had enough of California—he was going back to "the States," where the people took some comfort in living, etc.

He girded up his loins and went back.

He went in July, in order that he might be there "to smell the new-mown hay," etc. He smelled it.

He took in its fragrance by mouthfuls as he fled, pursued by a hoarse-voiced, red-eyed, slaving, 50-pound, "bedbug-crazy" dog that met him at the gate of the old familiar homestead.

As he sat in a stunted orabapple tree moping his brow and waiting for the neighbors to come and shoot the dog, he already began to think of Los Angeles, where there are no mad dogs.

The next day he went out "to live his boyish days over again by tossing the fragrant clover," etc.

A sunstroke and a race with a mad dog in two days. His thoughts relative to Los Angeles grew sorer and more serious.

The next day "a good, old-fashioned July thunder-storm" came to visit "the wanderer from the wild West." When it had taken its departure, with a little display of electrical pyrotechnics, for his especial benefit, that set the barn on fire, he went out to see "how Nature looked refreshed," etc. The hailstones went about six to the pound.

As he looked at the remains of the apple orchard he could not help thinking the apple crop would be light this fall. That night he laid awake and thunk, almost lovingly, of Los Angeles.

About a week later the grasshoppers made him a call. They did not take "the whole earth," but were contented with everything that grew upon its surface.

Then a cyclone visited the returned prodigal. It left nothing of "the dear old spot" but the bottom of the well and the cellar.

In the latter place the prodigal had retired to muse when he saw the wreck of a neighboring town whirling through the air to visit him.

But he swore he would stay until "Indian summer" anyhow, and enjoy "the sad and melancholy days of October." He staid until its close.

It closed unexpectedly. He retired one evening lulled and soothed by the poetic influences of the time and place.

He awoke to find both feet frozen and the thermometer 30° below zero. It was only one of the refreshing "changes of season."

In regard to Los Angeles, his thinking was now about 100 pounds to the square inch.

By great care he saved his feet, and as soon as the doctors would allow him to draw on his boots, he seized his overcoat and gripsack and started for the nearest station. He bought a through ticket to Los Angeles, and as the train whirled him away from "the beloved scenes of his boyhood" he remarked feelingly that "he should never see them again except in fancy."

He did not weep, either. In fact, the conductor says he swore.

That man now lives in Los Angeles. "His name is Legion." Beware how you mention to him a return to "the States" to live once more "amid the scenes of his boyhood," etc. He has been there.—Los Angeles Times.

A WELCOME FRAGRANCE.—It is prettily told in the current number of *Vick's Magazine*, how a party of Eastern friends, last spring, reached Alhambra at midnight, having been delayed several hours by an accident on the desert. It was a dark night, and as they walked up Garfield avenue, the main thoroughfare from the station, they were unable to distinguish their surroundings in this new, strange land. They were plodding along after their guide to the hotel, not knowing whether they were in the midst of sagebrush and cactus or palms and olives, when a wave of overwhelming sweetness came over them, and one lady cried, intuitively, "Orange blossoms! M—m!" And the others responded, "Yes, it must be! M—m—m!" And during the rest of that fragrant midnight walk the fatigue of travel was forgotten, and speculation ran rife as to the size and appearance of these wonderful trees, so near to one sense and so far from another.

YOUNG HOUSEWIFE.—"What miserable little eggs again! You really must tell them, Jane, to let the hens sit on them a little longer."

YOUNG FOLKS' COLUMN.

Nellie's Queer Idea.

(Written for the RURAL PRESS by O. B. SEEVER.)

Wee Nellie, with her dolls at play,
Was in the nursery one day,
Trying to teach them how to spell,
When ting-a-ling! pealed the door bell.

Straight to the window ran Miss Nell,
Throwing the dollies down pell-mell,
When, looking out, who should she see
But sister Emma's Mr. Lee.

A puzzling theme had vexed her brain
For many weeks; now came again
To bother her, and this, she thought,
The time to have the problem wrought.

So, hurrying down the stairs, she ran
Into the parlor, where the man
Greeted her with: "My little pet,
Your eyes are lovely—black as jet."

Then in came sister Emma, when,
The caller, like all other men,
Left little Nellie, and a flood
Of nonsense into Em's ears poured.

But Nell was not to be thus snubbed,
And climbing in his lap, she rubbed
Her fingers 'gainst his diamond quick,
And said in wonder, "It don't stick."

"Of course it don't," said Mr. Lee,
And then, the idea all at sea,
"You foolish child, why should you think
That diamonds stick?" (This with a wink

To sister Em.) Then Nell replied,
In accents grave and dignified,
Without a bit of mirth or haste:

"Why, Emma said your pin was *paste*!"

San Francisco, Sept., 1887.

A Day and What Came of it.

(Written for the RURAL PRESS by DAISY CAMPBELL.)

They were only two little Irish girls with shabby clothes, and barefooted, coming home from the great public school in East Haddon, one lovely day in June. Yet underneath rags there may be heartache, and an Irish heart can be as quick to feel unkindness as one of American nationality.

"Sure'n I wouldn't care at all if it was something we could help, but whin it isn't—" here Mary O'Reilly, the elder sister, stopped short.

"I hate 'em all," said Maggie, the younger, her black eyes flashing. "I wish to goodness we could lord it over 'em all once."

"We'd be as bad as any of 'em thin, Maggie, cushla," Mary answered, smiling through her tears. "It's just no disgrace to wear poor clothes whin you can't help it, and we must go to-morrow in the clothes we've got."

"I won't go and be laughed at," cried Maggie passionately. "I'll run away."

"Ah, no you won't, now, and make the mother feel so bad when she has so little to please her," Mary said coaxingly.

"Oh, why does the father drink? Why should we have all the troubles, and those dreadful girls have everything?" asked the younger girl, her bosom heaving with all the thoughts in her troubled heart.

"Well, we have 'em and we've got to bear 'em, and the only way is not to mind 'em, and have all the fun we can," Mary said with unconscious philosophy. "Come, Maggie, let's run a race to the nearest tree there beyant," and off they went toward home.

They were the poorest children in one of the four large schoolhouses in Haddon, and to-morrow was to be the last day of the school year, at which time there was always an exhibition and many visitors.

At recess this particular day the girls—most of them daughters of well-to-do mechanics in East Haddon—were talking over the coming event.

"I'm to wear the loveliest dress," said a bright-faced girl. "Mamma's been nearly killing herself to finish it in time. It's a white dress trimmed with the loveliest embroidery, and Aunt Ellen sent me a blue satin sash to wear with it."

"Hoh!" said Bridget O'Connelly in great scorn, "a white dress! I'm to wear a red surah silk trimmed with lace. And what are you to wear?" she asked suddenly, turning to the two O'Reilly girls.

Maggie flushed painfully and said nothing, but Mary answered gayly, "Oh, the finest dresses in the world; just wait 'till you all see them to-morrow. They'll take the shine off all the rest, but we won't be proud; and Mary's eyes twinkled merrily.

"Well, they'll be a sight better than any you've had since I've known you," said another girl, suddenly.

"Say, why do you girls go barefooted?" asked Kate Dunn, while the rest giggled.

Maggie opened her lips for an angry reply, when Mary answered quickly: "Sure'n it's coolin' to the blood on a warm day, and what's the use in botherin' with leather?"

There were several other slighting remarks, interrupted by the great bell calling them to school

once more. And this was what sent these two to their miserable home with sore hearts that bright June day. Maggie felt the taunts more keenly than her sister, but Mary felt them for Maggie. The elder sister had always shielded and protected the younger ever since she could remember. She inherited her happy, easy disposition, as well as her sense of the ludicrous and Irish humor, from her mother, who, poor woman! had need of it all to carry her through the trials which had fallen to her lot.

In Ireland, many years ago, Nora O'Connor was a pretty, gay girl with well-to-do parents, and singing and laughing from morning till night. Then she met handsome, dissipated Tim O'Reilly, and lost her heart immediately—poor Nora! In spite of the opposition of friends and family, she not only married him, but followed him to America. Her father gave her money enough to buy a nice little home on this side the ocean, and household effects for her marriage portion. For awhile all went well, then—it was during the war—Tim joined the army and took to drinking hard again. They were twice helped by well-to-do relatives West, but down they went from bad to worse, till now they lived in a miserable place, and had hard work to keep from starving, with a growing family to feed and clothe. In the meantime Nora's parents had died and she never would hint to her home folks how ill she had fared, partly from pride and partly from loyalty to Tim. Mary, the eldest child, was bright in her studies at school, and Nora was determined to keep her there as long as possible. She went out washing and house-cleaning, worked like a slave, yet through it all kept her sunny disposition, and, better than all, her firm faith in God.

The next morning Mary and Maggie started off for the exhibition. Nora had stayed up late the night before to laundry their dark calico dresses. Their hair, dark and abundant, was neatly braided and tied with bits of blue ribbon taken from an old hat. But shoes could not be bought. Mary had lain awake nights trying to think how Maggie could have a pair, but even her quick wit could not conjure a way out of such a difficulty.

Off they went, and Nora, as she watched them, said with motherly pride: "Now, where's a prettier face than my Maggie, and a quicker, smarter girl than Mamie?"

But Maggie's pretty eyes filled with tears as they left their mother far behind. "How I wish it was over!" she sighed.

"Ah, now, never mind them girls; let's play we're the queen's daughters in satin and velvet," said Mary; but her heart belied her words this time, for she dreaded the ordeal, too.

The superintendent, however, was not so blind as he seemed. He saw and heard more than the children imagined, and he and Miss Ryan, the teacher, determined to do what they could at the last moment to make their lot easier.

Mary was to take part in the second piece, and personate an Irish peasant girl. She was a born actor and threw herself into the character with all her heart, and kept the many visitors convulsed with laughter. She stood well in her studies, and the superintendent brought her out as much as possible.

Maggie was but an ordinary scholar, but she had a sweet, expressive voice. Miss Ryan whispered to her to sing a duet with Mary the sisters had sung before. Maggie's heart beat fast at thought of getting up before so many in her plain dress and bare feet, but Mary whispered words of cheer, and when they were on the platform Maggie's fright gradually left her, and she sang the last verse with all her heart. The applause was so great that Miss Ryan whispered to Maggie to stay and sing a little ballad she knew. The air was simple, but full of pathos, which brought tears to many eyes.

There was considerable interest in the two little girls, and after the exercises were over a tall, handsome lady stepped up to the superintendent and questioned him about them.

"Well," she said decisively, "this is what I'm to do with my money." Then she explained to the interested man before her that she had set apart a sum of money for a thank-offering for her only daughter's recovery from a severe illness, to be used in educating and clothing some deserving girl. "And," she concluded, "Mary O'Reilly is the girl to have it."

"And I, with the teachers in the building, have decided to help Maggie through the public schools with books and clothes."

"And sure'n Mamie, the dear Christ sint the help to you gyrls, whin me faith was most gone; for where the money was comin' from to let you go next term to school I didn't know. I don't ask for myself—I'm reapin' the fruits of my own willfulness; but for you and little Maggie I wanted some of the brightness of heaven." This was what Nora said when Miss Ryan had brought the good news to Mary.

"And it's meself that'll be prayin' night and morning for blessings on the dear lady's head, and the rest for helpin' us," Mary said to Maggie as they lay on their straw bed that night looking at the clear, starry sky.

"To think that we'll be dressed loike other folks at last," said the younger sister. "I'm sorry, Mamie, I got so mad," she added in a subdued voice, and in a few moments both little girls were fast asleep.

THE foolish virgins in the Scriptures came with no oil in their lamps. Now she comes with a four-gallon can of kerosene to pour on the kitchen fire, and her funeral expenses are added to the cost of the oil.—*Ex.*

GOOD HEALTH.

Use of Toilet-Soap.

The opinion that such a necessary article as soap for the toilet one cannot use too much, says Hester M. Poole in *Good Housekeeping*, is an opinion which late researches in science disprove. The attraction of the alkali in it for the oil of the skin, as well as its unclean accumulations, constitutes its cleansing property. Out of the 7,000,000 pores through which nearly two pounds of poisonous exhalation daily pass from the adult, come enough materials in a short time to produce fatal and filthy diseases. An eminent physician has declared that, "if the skin be moderately active, three or four days suffice to form a layer which may be compared to a thin coating of varnish or sizing." As this accumulation increases and decomposition follows, it is not necessary to describe the result. What agency but soap can remove it?

Many good authorities declare that water alone is sufficient, except at rare intervals. There are oil glands as well as excretory ducts, and for no idle purpose has nature produced these tiny human oil wells. Inunction, or the external use of oil, has a recognized place among the prescriptions of some famous modern physicians, who in this way seek to restore the necessary property of which the body has been deprived by the excessive use of soap or by disease. They claim that it enables the patient to resist cold, that its nutritive qualities convey heat to those organs which require it, that it gives a sense of exhilarating freshness, and that it is not only soothing in cases of nervousness and depression, but is capable of strengthening weak lungs. For this purpose almond oil, coconut, olive oil or vaseline are daily applied by the aid of vigorous rubbing. To all such treatment, and in most cases where inunction is not required, the daily application of soap is injurious.

"What uncleanly habits!" some one exclaims. Not so. Plenty of soft water, a coarse wash-rag, hand friction and a Turkish towel, with soap applied at rare intervals, and the skin should retain the delicate smoothness of an infant. Those milk baths indulged in by the ancient Roman emperors and empresses owed their emollient properties to the oil contained in the milk. Every old nurse knows, too, that weakly children are sometimes injured by too frequent ablutions. Dry rubbing is often the safest opiate for a nervous little one, answering many of the purposes of soap.

An eminent physician and scientist lately told me that he seldom used soap in his daily bath. "It makes the skin dry, hard and harsh, and renders me much more liable to take cold through any changes of the weather," said he. "At the same time, no rule can be given for the use of soap. Some persons secrete oil much more readily than others, and to such soap is more of a necessity," and he spoke much upon the desirability of using a pure soap or none at all.

Health in California.

Southern California is not the only part of the State which is noted for the health-producing influences of its climate. Dr. Tyrrell of the State Board of Health well observes in his August report, that "if reports of prevailing diseases are to be taken as fair evidence of the sanitary condition of a State, then California must be considered just now the freest from disease of any State in the Union. Nearly 100 different localities have been heard from, comprising towns and cities in every county, and not one announces that any serious disease is prevailing."

The total mortality for August in 70 localities outside of San Francisco, which are estimated to contain a population of 362,500, was 372, a trifle over one in the thousand. This was in what is usually one of the most unhealthy months of the year. Moreover, of the deaths reported nearly one-sixth were from consumption—a disease rarely contracted here. Nearly all these cases were of those who had come here with the disease firmly implanted in their systems, hoping to prolong their lives under the genial climate of California.

Next in fatality come diarrhea and dysentery—diseases almost always traceable to irregularities and for which the climate is in no way responsible.

The next in order is diphtheria, which, unlike this disease in the East, is never epidemic here. In this city last month there were 61 cases. The difficulty with diphtheria in a city like San Francisco is to isolate the cases so as to prevent the spread of the disease. It is now well established that diphtheria and membranous croup, which are substantially one and the same disease, is the most contagious of all disease, and is communicated by proximity and even by contact with the clothing of a patient. In families where it is impossible to isolate the patient, or where from ignorance of the laws of health he is surrounded by visitors or relatives, the odds are always in favor of the spread of the disease. Hence it is generally more destructive in crowded parts of cities than elsewhere, and hence, to some extent, the prevailing error with regard to its necessary connection with defective sewers.

DOMESTIC ECONOMY.

STEWED MACARONI.—Half a pound of "pipe" or "straw" macaroni, one cup of milk, one teaspoonful of minced onion, one tablespoonful of butter, half a cupful of cheese, pepper and salt to taste, bit of soda in the milk. Break the macaroni into short pieces, and cook about 20 minutes in boiling water, salted. Meanwhile heat the milk, dropping in a tiny pinch of soda with the onion, to the scalding point. Strain out the onion, drain the water from the macaroni, and put the milk into a saucepan. Stir in the butter, cheese, pepper and salt, and finally the macaroni. Cook three minutes and turn into a deep dish.

CUSTARD EGGS.—Put the washed eggs in a saucepan of cold water and let them just come to a boil; then take them up. Or, lay them in a hot tin pail, cover them with boiling water, put the top on the pail and leave them on the kitchen table for four minutes. Drain off the water, pour on more boiling water, and replace the top. Wrap a hot towel about the pail and leave it four minutes before dishing the eggs. They will be like a soft custard throughout, and more digestible than if cooked in any other way.

FRESH MACKEREL.—Clean the fish, scald a bunch of herbs and chop them fine, and put them with one ounce of butter and three tablespoonfuls of soup stock into a stew-pan. Lay in the mackerel and simmer gently for 10 minutes. Lift them out upon a hot dish; dredge a little flour and add salt, cayenne, a little lemon juice, and finally two tablespoonfuls of cream; let these just boil, and pour over the fish.

HOMINY CROQUETTES.—To one quart of boiling water add a teaspoonful of salt; stir in gradually a heaping half-pint of the finest hominy; boil three-quarters of an hour, and put it on the back of the range, where it will remain hot an hour longer; then put in a large bowl and add the beaten yolks of two eggs, mix it thoroughly, and when cold shape into cones; dip the cones in beaten egg, roll in crumbs, and fry in boiling fat.

POTATO FRITTERS.—Boil and peel six large potatoes or a dozen smaller ones; mash them well and add four well-beaten eggs, a little cream or milk, chopped parsley, chives, salt and pepper, and mix the whole together. Raise on the end of a knife about a teaspoonful of this paste, and drop it into a pan of boiling lard or butter, when the paste will swell and form a light, round fritter.

CORN BREAD.—Turn boiling water upon four quarts of meal and stir until it is all scalded, but not very moist. Then add one and a half quarts of sour milk or buttermilk, two teaspoonfuls of soda, two cupfuls of sugar, and flour to make it as stiff as can be stirred. Bake in a six-quart pan in a moderate oven for two hours and a half.

TONGUE CHEESE.—Take one beef tongue, two calves' livers, three pounds of salt pork, and boil until thoroughly cooked. Mince together very fine, season to taste with spices, press the mass into a pan and allow to get cold. Slice thin and serve upon a napkin in a lunch dish.

FRIED APPLES.—Make a batter of two eggs, a pinch of salt, a cup of milk, and six tablespoonfuls of flour. Slice, pare, and core tart apples as thin as Saratoga potatoes. Dip them in the batter and fry. Eat with powdered sugar.

FRIED SALT PORK.—Cut as many slices as will be required for breakfast, the evening before, and soak till morning in sweet milk and water. Then rinse till the water is clean, and fry. For a change it may be rolled in cornmeal and then fried.

JELLY CUSTARD PIE.—Four eggs, whites beaten separately, one cup of sugar, two tablespoonfuls of butter; beat well; add one cup nearly full of jelly; last thing add the whites of the eggs; bake on thin pastry.

GINGER CAKE.—One cup of molasses, one cup sugar, two tablespoonfuls black pepper, two tablespoonfuls ginger, two of cinnamon, one cup butter, one-third cup sour milk, five cups flour, one teaspoonful soda.

GRAHAM GEMS.—One quart of buttermilk, one teaspoonful of soda, one teaspoonful of salt, Graham flour enough to make a stiff batter. Bake in gem pans hot and well greased, in a hot oven. Try it.

WHITE CAKE.—Whites of six eggs, two cups sugar, three cups flour, one cup sweet milk, three-fourths cup butter, two teaspoonfuls cream tartar, one teaspoonful soda.

SUGAR COOKIES.—Two cups of sugar, one cup of butter, one-half cup of sweet milk, four eggs, three teaspoonfuls of baking powder; flavor with nutmeg.

CORNSTARCH CUSTARD.—Put a pint of milk in a frying-pan, let it come to the boiling point, then add a pinch of salt and two tablespoonfuls of cornstarch. Serve with sugar and cream.

SUGAR COOKIES.—One cup butter, two cups of sugar and three eggs. Flour enough to make a soft dough. Flavor with cinnamon or nutmeg and bake in a moderate oven.

DOUGHNUTS.—One cup sugar, one heaping tablespoonful butter, one egg, one cup sweet milk, half a nutmeg, two teaspoonfuls baking powder, one quart flour.

PICKLED EGGS.—Boil hard and put into cold water; when cool remove the shells; stick cloves into them and put in cold vinegar.

The Week.

While the great displays of California's industries, agricultural, mechanical and ornamental, have been open and viewed by throngs of visitors at the capital and the metropolis, the district fairs have been taking their week's recess since our last issue.

The pilgrims from the Golden Gate to the G. A. R. Encampment at St. Louis are rolling eastward, accompanied by consignments of choice fruit and other products there to be displayed to excite still further interest in California, and aid, no doubt, in swelling the boom-tide yet higher.

The raisin-makers are now busy in various portions of the State; and the light showers, reported from Visalia as having fallen there about this Wednesday noon, and predicted by the Signal Office as likely to fall to-night in the southern counties, can hardly be too light to please the Muscat-curers.

At a special meeting of the Board of Trade at Los Angeles, resolutions were adopted favoring the project of a standard gauge railroad from Salt Lake City to Los Angeles, and pledging the support of the board in carrying out the plans proposed by the projectors at Salt Lake.

It is expected that the whole area burned over at Marysville will be speedily covered with new structures much better in most instances than those destroyed.

Forest Fires—Their Causes and Prevention.

As the season is upon us when the danger of forest fires is imminent, a caution to those most apt to cause such fires is in order. From this time on till the advent of the fall rains, the woods, the open land and the cultivated fields everywhere are dry as tinder. A spark now communicated to the stubble, the grass, the leaves, the bark, limbs, chips or other debris caused by the wood-chopper, the logger or the carbonaro, and a fire is started which it may be impossible to check until much valuable property is destroyed.

These conflagrations are generally caused by carelessness. To a partially burned match or the stump of a cigar thrown away by a smoker; the camp-fire of a traveling emigrant, a tramp, prospector or hunter left smoldering, or to some other heedless act, they are in most cases chargeable.

Property to the value of millions is thus destroyed every year, this property consisting mainly of growing timber, sawlogs, lumber, firewood, sawmills and fences; sometimes barns, houses and bridges are consumed. Occasionally, as happened last year in Shasta county, towns and costly reduction-works are threatened by the flames, from which they are saved only by the most strenuous exertions. In the mining districts of the State many quartz-mills, flumes and even dams have been burnt up. Frequently these fires, getting beyond control, sweep over vast areas before they are checked by running streams, deep, rocky canyons or other natural barriers to their further spread. Where this occurs, the whole country is devastated, everything in their track being destroyed save only the tall live timber, the dead trees being devoured and often creating so fierce a heat that the largest green trees standing near are killed. The saplings and trees of smaller growth, the chaparral, the wild grasses, are all licked up, the larger trees being killed and charred, but not always consumed, and thus converted into combustible material to help along the next forest cremation.

When these fires break out on the higher mountains, or in other unpeopled regions where most of the land still belongs to the U. S. Government, there being no one interested to stay their progress, they run till they exhaust their stock of material, or are stopped by the interposition of deep gorges, rocky heights, snow-fields, barren sage lands, or the like. The losses, here, however great, cause individuals but small concern. This being the case, it would seem that more effectual measures than any yet adopted should be taken, both by the local and the general Government, to prevent such frequent recurrence of these desolating disasters, an end that can, of course, be reached only through legislative enactments.

Among other remedial measures the Forestry Commission has suggested that the timber lands, which it is designed to preserve, be isolated into blocks of moderate area, separated by strips of waste land, wide enough to prevent the spread of the flames from one block to another. In selecting such preserves, topographical conditions would have to be consulted, such as the presence of rocky summits, deep ravines, and water-courses. Besides this, there ought to be appointed patrolmen or special guards to prevent fires being started, and to adopt prompt and effectual means for their suppression when started, the intentional or even careless starting of such fires being made a penal offense, punishable by both fine and imprisonment, the fine imposed to go wholly or in part to the informer.

THE MECHANICS' FAIR this year appears to be a great success financially. The receipts before it was half over amounted in round numbers to \$26,000, against \$32,000 for the entire run of last season. Now that the State Fair is over, we hope to pay more attention to the great and diversified show in this city.

NEARLY 10,000 sheep en route from the western end of the Manitoba track have passed Fort Benton, M. T., in five days. This is the first shipment by this line to St. Paul. The track is now only 25 miles of five days from the terminus.

PEACHES and prunes are a failure and the apple crop is light in the Yaquina valley, Or., this year.

The State Fair.

Notes of the Progress of a Grand Exposition.

[Editorial Correspondence.]

Since jotting down notes of the opening of the State Fair for the last issue of the RURAL, the work of setting of the exhibits has been completed, and the throngs of people who are now pouring into Sacramento from all directions find an exposition of industrial materials which is a credit to the resources, the productive power and the progress of the commonwealth. This remark is true both of the live-stock display at the park and the still-life exhibition in the pavilion. The racing interest is also active, and, as usual, claims much attention. All things are not smooth in this branch of the fair. We hear many mutterings of discontent with the way in which the rules are enforced, with the handling of the pool business, etc., but we are not able to judge of these matters and therefore refrain from comment. The people who believe things are not managed in the best way should act together and secure the enforcement of better methods. We know no other way in which it can be done.

The Live-Stock Parades.

We have given close attention to two stock parades thus far and have been much gratified at the quality of the animals shown. Probably there never was a better gathering of horses and horned stock in the State than that to be seen this year.

The display of horses reaches just around the track—a solid mile of animals, all of which can show good points, and many of them possessing singular merit and having most honorable blood in their veins. We have not room to specify many of the animals, for the collection is too great. Every owner can be proud of contributing to such a display.

Perhaps a group which attracts particular attention because of their airy grace and the striking manner in which they are ribboned for the display, is comprised of Joe Hooker and a lot of his get—yearlings of excellent growth and action, bright sorrel and wonderfully like one another.

An imported horse which has won many prizes on his native heath, but appears for the first time in the State track in California, is the Shire horse Exchange. He is a bright bay, six years old, standing over 17 hands high and weighing 2300 pounds. The lower half of his legs is covered with a long, heavy, wavy growth of hair, the hinder ones being snow white. He is owned by G. H. French of Santa Clara, and was imported last year.

Theodore Skillman of Petaluma makes a fine contribution to the display in a group of five stallions of his own importation from France, three being Norman Draft and two French Coach. They are grand animals and win much admiration. Mr. Skillman will take another start for France soon after the fair closes to secure another lot of Percherons and French Coach horses for importation to California.

Among the many others, we chanced to notice especially Mr. R. C. Sargent's four-year-old roadster stallion, a fine animal, Mr. Roberts' group of Clydesdales, Frank Cox's brace of draft stallions, one three and one four years old, and J. H. Glide's three-year-old roadster mare. Others perhaps on close attention are quite as worthy of mention. We must trust to the judges to give us a chance to name them in the premium list.

The Cattle.

There is a gathering of live-stock men from great distances to see the fair this year, and the value of exhibition to those who are breeding good stock will, no doubt, be apparent. The disposition to introduce thoroughbred sires was never greater than at present, and cattle-owners have made long journeys to inform themselves and to select animals which please them. These visitors were, no doubt, glad they came, for we heard some of them exclaiming, "Well, I never saw so many fine cattle in my life." And yet the exposition did not have exhibits from all our California herds. Quite a number were conspicuous by their absence this year. Perhaps the interest manifested this year will bring them all next year, and if so the State society will have to double its stall accommodations, which are none too great this year.

The two breeds which have the largest representation are the Shorthorns and the Holstein-

Friesians. The Shorthorns are shown by five California breeders and there is also a lot brought from Illinois to be auctioned. The California exhibitors are Robert Ashburner of San Mateo county; Wilfred Page of Sonoma county; R. J. Merkeley of Sacramento county; Peter Peterson of Colusa county, and Coleman Younger of Santa Clara county.

Mr. Peterson's herd is the largest, including 23 head, of which there are eight bulls. He has a young bull (two-year-old) at the head of his herd which weighs nearly a ton.

Wilfred Page shows 18 head, including twin heifer calves, dropped by Belle Sonoma on Sunday night. This herd has a way of recruiting itself at the fairs, as last year they took away animals not on the entry list. The herd is headed by Sonoma Second, a fine three-year-old, with Mugwump, a two-year-old, as first lieutenant.

Robert Ashburner has a good selection from his famous Baden Farm herd of milking shorthorns, which our readers know well by reputation. Mr. Ashburner has fine deep cows which win admiration from any experienced dairyman.

R. J. Merkeley's herd receives much attention. He sold during the fair a five-month bull calf, "Seymour," to M. D. Pullen of Port Townsend, W. T.

Col. Younger & Son have their usual collection of animals, with some young stock. The herd was well shown by Ed. Younger in the absence of the Colonel through illness. His commanding figure was greatly missed from the parade ground and the prize-ring.

Holstein-Friesians were shown in magnificent profusion, nearly 100 animals being on the ground. J. H. White of Lakeville, Sonoma county, came first in the stalls with his 18 head, finely formed, clean-cut color markings, and in such moderate flesh as one likes to see in dairy stock, because it shows that the food goes to the pail.

Leland Stanford's herd was next to Mr. White's. There was a fine string of over a dozen bulls of different ages, and a large collection of cows and heifers, including the famous deep milkers which were imported just before the last State Fair, and which we described at the time. Senator Stanford's herd shows liberal feeding and were in good show condition.

F. H. Burke showed 43 head, some of them brought up for the auction sale, which has already been noticed in the RURAL PRESS. Mr. Burke's stock attracts much attention, and we anticipate a good sale for his offering.

George Bement & Son have a clear field this year for their Ayrshire herd.

Henry Pierce shows a nice band of Guernseys. Mr. Pierce tells us that he has a steady demand for the Guernseys, and will import more. We are glad the value of the breed is being recognized. Mr. Pierce also has a representation from his Yerba Buena Jersey herd, beautiful animals carrying some of the very best blood of their kind.

Dr. Nichols of Sacramento shows a small band of Jerseys, including some excellent specimens.

There are two herds of Herefords, both recent arrivals to the State. The largest collection is by Vaughn & Williams, being the cattle bred by James Kay of England and brought to this country for sale. We have frequently alluded to this stock. Mr. Williams came to California about a year ago for the last State Fair. Mr. Vaughn, who is now associated with him, is a larger importer of cattle to the United States and Canada, having, it is said, imported about 1000 head per year for the last seven years.

A very nice band of Herefords is that brought from Wyoming by Geo. F. Morgan, manager of the Wyoming Hereford Association. This company won notable prizes with their Herefords over all beef breeds at the Chicago Fat Stock Show, last November. They have some of the best blood in existence, and they have brought some excellent animals to begin their trade in this State.

The County Exhibits.

Turning now from the park to the pavilion, it may be remarked that the county exhibits are now in excellent condition as to style and completeness. True, the perishable fruit begins to break down and the plates have to be replenished, but otherwise the displays are in permanent condition.

(Concluded on page 253.)

The California Sahara.

Having reference to its meteorology, that section of the United States lying west of the Rocky mountains may be characterized as humid, sub-humid, and arid. While Oregon and Washington Territory belong distinctly to the humid, the most of California is referable to the sub-humid district; Nevada, Utah, and the other Territories lying west of the great central Cordillera constituting the region of marked aridity, being that in which, save in a few spots, the cereal crops cannot be matured without irrigation. These exceptional spots, which are of limited extent, consist of narrow bottoms along the rivers and sloughs, or moist lands situate on the margins of the sinks and lakes. The arid portions of California consist of the large area of barren lands occupying the south-eastern part of the State and of the strip of country lying east of the Sierra Nevada, which includes the counties of Modoc, Lassen, Alpine, Mono and Inyo.

These barren lands, because of their lower altitude and their position in the isothermal belt, possess a climate wholly unlike that which obtains in other sections of the arid region, the temperature here being almost tropical throughout the summer and mild and equable the rest of the year; whereas, the summers elsewhere in these realms of drouth, though warm, are short, the winters that intervene being of great length and almost Arctic severity. The spring and the autumn here are very brief, the snow commencing to fall in November and sometimes earlier, and continuing till May with showers often in June and July. With such a climate the agricultural capabilities of the countries basined between the Sierra Nevada and the Rocky mountains are limited in extent as well as in the variety of their products. While the more hardy fruits and vegetables and the cereal crops can, with irrigation, be successfully cultivated, none of the semi-tropical fruits can be grown there.

But what may yet come of these warm, lowlying waste lands that occupy the south-eastern angle of California no one can tell. Looking out on this vast expanse, so desiccated and dead, the beholder might well ask, with the prophet of old, "Son of man, can these dry bones live?" Perhaps they cannot; yet this is more than we would dare affirm. We are not, in truth, bold enough to speculate on the future of these arid lands. With our past experience in this State, we will not presume to say or even guess what powers of production slumbering in the mold of these deserts, experimentation aided by science may yet quicken into life. Much of the soil here is good, having resulted, not so much from vegetable decomposition as from the disintegration of the surface rock. In some localities it is largely mixed with marine shells, for this region is supposed to have once been the bottom of an inland sea, sections of it being still depressed many feet below the present ocean level. At these points of depression occur valuable salines, some of which yield the borates of lime and soda, and others the carbonate of soda and the chloride of sodium, large quantities of these several salts being gathered here every year. In a few places the soil is impregnated to an injurious extent with alkaline constituents, but this soil, once these ingredients are eliminated by a free use of water, becomes exceptionally productive. It is likely

that gypsum, and possibly other fertilizers, might have the same effect upon it.

While there is, perhaps, as little surface water here as on any area of like extent elsewhere on the continent, an abundance of good water has been obtained at several places, and at no great depth by artesian boring. By the same method there is reason to believe water, in limited quantities at least, could be obtained almost anywhere on these deserts. Should this prove to be the case, it will go a good way toward helping on the work of their reclamation, since almost anything can be raised here with the aid of irrigation, the barrenness being due not so much to the infertility of the soil as to

perhaps, it may prove useful for making paper, which there is a chance of its doing. The mountains on these deserts do not occur in long ranges, but in detached and scattered groups of comparatively small elevation. As a consequence, they fail to catch and condense what little humidity the atmospheric currents passing over them may carry. But very little moisture ever reaches thus far inland, what comes in from the ocean being arrested by and precipitated on the Sierra Nevada, the San Bernardino and other high mountain ranges to the west. The yearly precipitation between these mountains and the Colorado river averages hardly more than four inches.

ness constitutes our agricultural elephant, the powers that be will have to look after help if they hope to ever get it off their hands.

Many years ago the general Government did give enough attention to these lands to have them surveyed or at least to order their survey; a movement necessitated by the political exigencies of the times, which, there not being enough offices to go round, required that employment should be found for the seekers after place who could not otherwise be accommodated. These applicants for public favor were of the kind that knew the master's crib, and, braying vehemently, being hungry, what better could the master do than feed them on these husks, there being no more corn in the crib. The men sent to do this work were selected with special reference to their fitness for service on these parched and arid plains, being those little addicted to the use of water as a beverage.

Burial of Gov. Bartlett.

Funeral honors to the late Washington Bartlett—the first of California's Governors to die in office—have been fittingly rendered. All day Thursday, the 15th, and up to 9:30 on the morning of Friday, the burial-day, his remains lay in state in this city, at Pioneer hall, amid elaborate and lavish floral tributes, with a guard of honor from the Third Regiment; and 20,000 people filed by to look upon the face of the dead magistrate.

Friday morning, Sept. 16th, the casket was removed to Trinity church, which was filled, and more than filled, by a packed congregation. Rev. Dr. Beers delivered an address, which was rather eulogy than sermon, and the venerable Bishop Kip read the last prayers for the dead.

Among the pall-bearers were eight ex-Governors of the State of California, namely: Burnett, Downey, Stanford, Low, Booth, Pacheco, Perkins and Stoneman.

The imposing procession included a large detachment of troops, numerous dignitaries and civic organizations. It was considerably over an hour passing a given point, and was viewed by dense assemblages along the line of march to Laurel Hill, where the body was laid to rest.

Mountain Pears.

On the 9th inst. H. A. Frost of Dutch Flat wrote the RURAL PRESS:

I this day send per express a small sample box of our mountain Bartlett pears, raised on the 3400-foot level. Please set aside until mellow; then try them.

There is no boom here, but this is the home of the Bartlett pear and winter apple all the same.

We followed directions, keeping the case intact until the evening of the 15th, when we opened it and tried the contents. The box was a trifle short of 18x12x6 inches, inside measurement, and 40 pears filled it. The fruit was very handsome; several, around which we put the tape-line, showed a girth of from 10 to 10½ inches, and in the final test they proved high-flavored and meltingly delicious. The judges concur in the opinion that Placer pears are "away up" in more senses than one, and thank the donor for submitting the case for their decision.

IRON CARS.—Some hundreds of railway cars, almost wholly of steel and iron, are being built in England for Hindostan, in the expectation that they will prove less perishable in that climate than cars of wood. The time will soon come when steel and iron will be the only material aside from upholstery which will be employed in the manufacture of all first-class cars.

THE LATE GOVERNOR BARTLETT.

Photo, by Taber.

the lack of moisture. Bunch grass of several varieties grows on these "bad lands"; in some places sparsely, in others with the greatest luxuriance. They would, therefore, afford both summer and winter pasturage for an immense amount of stock, could only water enough for the support of the latter be had. The introduction of water from the Colorado on these deserts is a scheme that has long been talked of. But this water, even were the entire river brought in, would suffice to irrigate but a small portion of them; besides, doubts are entertained as to the feasibility of this scheme.

This California Sahara, while it possesses a better climate, labors under some disadvantages not common to the rest of the arid region. Elsewhere the country is traversed by long ranges of lofty mountains, which afford much water and timber. But here both are scanty, the only trees found being the mesquit and the yucca palm, growing only in a few places and there much scattered. The former makes a good fuel, but is of no account for lumber, the latter being utterly worthless, unless,

With so much good land elsewhere to be had and fit for immediate use, there is, of course, no urgent necessity for hurrying up the reclamation of this southeastern Edom. Certainly, it would be premature to attempt "booming" that section of the State just at present. But it is none too soon to begin thinking over the matter, and to be devising ways and means looking to the ultimate redemption of these barren lands. The general government, which still owns the most of these lands, ought to make provision for sinking artesian wells at eligible points upon them. It might also experiment to advantage in the direction of deep plowing, the application of fertilizers, tree-planting, etc. If only a tree or even a weed could, without much cost, be made to reach a rank and rapid growth here, the recovery of these lands would be insured, since this, besides enriching the soil, would tend to increase the amount of rainfall. What with their well-watered and timbered mountains, most other parts of the public domain are capable of taking care of themselves. But this California wilder-

THE FAIRS.

Golden Gate—First District.

The fair of the First District Agricultural Association, comprising the counties of Alameda, Contra Costa and San Francisco—otherwise called the Golden Gate Fair—has usually been held in Oakland, but this year it was decided to try the experiment of holding it at the Bay District track in San Francisco, where it came off Sept. 5th to 10th.

The early rain which fell on Sunday and Monday made the track so slippery that the opening of the races was deferred to Wednesday, but genuine agricultural interests, it is probable, suffered no loss on that account.

The show of fine cattle was considered very creditable. Of Holstein-Friesians there were J. H. White's, spoken of at some length in the RURAL of Sept. 10th, and F. H. Burke's 16 head from Menlo Park, a choice representative of whom was portrayed on our first page a month ago.

Seth Cook's Polled Angus herd, as well as his two splendid Cleveland Bay stallions, so much admired at recent fairs in Sonoma county, were here to be seen again. Small exhibits of Jerseys were made by P. C. Anderson and by Thos. Ward of Oakland. A band of Herefords was shown by Wm. Dunphy of Monterey county, and Ayrshires by Geo. Bement & Son of Redwood City. The favorite old Shorthorns were well represented from the herds of Wilfred Page of Sonoma, Seth Cook of Danville and Robert Ashburner of Baden, who divided the honors.

At the stock parade on the 8th L. Howlett, W. Behler of Petaluma, A. B. Spreckels, F. Lapham and B. E. Harris each drove a handsome team of large carriage horses. J. H. Newton headed the procession of roadsters with a pair of thoroughbred Hungarian ponies, somewhat resembling the Shetland pony in stature, but heavier limbed, dapple gray, with long white manes and tails. Robt. Ashburner took all the premiums for draft horses.

Beside their cattle, Bement & Son showed half a dozen prize Southdown sheep, and Andrew Smith of Redwood City had it all his own way with Shropshire sheep and Berkshire swine.

A large proportion of the animals on view at the Bay District track were transferred to the State Fair at Sacramento.

Petaluma—Fourth District.

Following are awards at the Fourth District (Petaluma) Fair, for products of agricultural and allied industries:

Horses.

THOROUGHBREDS.—P. Carroll took all premiums except one, viz.: J. McMillan, best 3-yr-old mare Alice T.

STANDARD TROTTERS.—Stallions—W. Page, 4-yr-old Polo, 3-yr-old Mortimer, 1-yr-old Eclectic; J. R. Rose, 2d 4-yr-old Gen. McClellan; F. W. Loeber, 2-yr-old Free Willie; J. R. Fritsch, 2d 2-yr-old McGregor. Mares—S. Sperry, 4-yr-old Debonair; A. Allen, 2d 4-yr-old Fannie Allen; I. M. Proctor, 2-yr-old Silky; W. Page, 1-yr-old Secreia.

ROADSTERS.—P. J. Shafter, stallion 3-yr-old Rustic Boy; W. Page, mares 4-yr-old Reka Patchen, 3-yr-old Patti Patchen; G. McDonald, mare 1-yr-old Alice M.

CLYDESDALES, ETC.—Stallions—Clydesdale Horse Co., 4-yr-old Morning Star, 2d 4-yr-old Sol. Gilmore; Sol. Gilmore, 2d 4-yr-old Pride of the West; W. Page, 3-yr-old Premier, F. Roberts, 2-yr-old Pointsman, Jr.; L. A. Hardin, 1-yr-old, no name; J. A. McNear, 1-yr-old Pointsman Second; Denman & McNear, colt under 12 mos. Pointsman, Jr.; R. H. Crane, 2d colt under 12 mos. Burnes. Mares—Denman & McNear, 4-yr-old Maid of the Mist, 2d 4-yr-old Blossom and 1-yr-old Belle; W. Page, 3-yr-old Dora and 2d 2-yr-old Freckle; R. H. Crane, 2-yr-old Annie; P. Hennelly, 1-yr-old Nellie Pointsman and mare colt under 12 mos., no name.

GENERAL PURPOSE.—Stallions—Seth Cook, 3-yr-old Royal Studley; John Poplin, 2d 3-yr-old Whippleton, Jr.; R. Crane, 2-yr-old Bob; G. McDonald, 1-yr-old Tom Paine; Jos. Purrington, colt under 12 mos. Grover Cleveland and 2d do. Star. Mares—L. A. Hardin, 3-yr-old Kate; Frank Roberts, 2d 3-yr-old; R. Crane, colt under 12 mos. Carrie D.; Jos. Purrington, 1-yr-old Mollie, 2d colt under 12 mos. Sallie Walker, also stallion showing best 5 colts, either sex, Alexander 2d and family.

CARRIAGE, SADDLE AND GENTLEMEN'S ROADSTERS.—Wm. Bihler, carriage team shown to carriage, Normans; J. Carter, 2d do.; F. Roberts, mare or gelding Bay Johnnie; F. Wickersham, 2d do.; Leonora; J. Yates, mares or geldings to pole, Katie & Mollie; J. R. Rose, 2d do.; Maud & Minnie, and single mare or gelding to buggy, Josephine; J. B. Hinkle, 2d do., Phoebe.

NORMANS AND OTHER FRENCH DRAFT BREEDS.—Stallions—Theo. Skillman, 4-yr-old Ernest Parroll; Sonoma Stock Breeders' Association, 2d do., Trumpette; T. Skillman, 3-yr-old Paradise; L. A. Devoto, 2-year-old Duke of Marin and 1-yr-old De Chartre; J. P. Rodheaver, stallion showing best 5 colts, either sex, Beaufort and family. Mares—P. Hennelly, 4-yr-old Queen of the Valley; Wm. Hill, 2d do., Annie, and 1-yr-old Bessie.

JACKS, JENNETS AND MULES.—J. A. Box, jack 3-yr-old Black Night; P. Mawler, jenny 3-yr-old Jenny.

Cattle.

SHORTHORNS.—W. Page took sweepstakes and all premiums except the following, viz.: I. R. Jewell, 2d bull 4 yrs. old. M. D. Hopkins, bull 2-yr-old Sharon Bell Duke; John Lynch, bull calf under 12 mos., Little Pet, Jr.

POLLED ANGUS.—Seth Cook took sweepstakes and all premiums.

HOLSTEIN.—J. H. White took sweepstakes and

all premiums except the following: E. Steiger, 2d bull 1 yr. old, Diamond Dick.

JERSEYS AND GUERNSEYS.—Bulls—Roy Bros., 4-yr-old Olimpo and 1-yr-old Romulus of Marin; Bliss Estate, 2d 4-yr-old Favorite and 3-yr-old Nantasket; Hall Bros., 2-yr-old Wildwood; P. Lawler, 2d do., Taurus of Situate; H. P. Brainerd, calf under 12 mos., Boom. Cows—Roy Bros., 4-yr-old Moorish Maid; Bliss Estate, 2-yr-old Juanita 2d; H. P. Brainerd, 1-yr-old Maggie.

AYRSHIRES.—Geo. Bement and son, all premiums and sweepstakes.

GRADED.—W. Page, cow 3 yrs. old, Ain't-She-a-Daisy; 2 yrs. old, Squeeze-me-bag; 1 yr. old, Belle of Tarweed Flat; Bliss Estate, heifer calf under 12 mos., Ustane.

Sheep and Fleeces.

SPANISH MERINO.—J. Lawler, all premiums.

SOUTH SHROPSHIRE, OXFORD AND HAMPSHIRE DOWNS.—R. H. Crane took all premiums except the following: Geo. Bement & Son, 2d ram 2 yrs. old and 2d 3 ewes 2 yrs. old.

GRADED FLEECES.—Pomona Grange, 5 fleeces combining wool.

Swine.

POLAND CHINA.—R. H. Crane, all premiums.

Poultry.

J. L. Winans, St. Brahma fowls and chicks; W. D. Freeman, 2d St. Brahma fowls, 2d Brown Leghorn fowls, Black Leghorn fowls and Houdan fowls; Mrs. Wm. Hill, 2d St. Brahma chicks, Buff Cochins fowls; P. A. Meadow, 2d Buff Cochins fowls, Buff Cochins chicks; S. H. Church, Plymouth Rock fowls, Blk Spanish fowls, Brown Leghorn fowls and chicks, Silver Spangled Hamburg fowls and 2d do. chicks; J. Blackburn, 2d Plymouth Rock fowls and 1st Wyandotte chicks. Mrs. Isabella Walker, 2d Plymouth Rock chicks, 2d Wyandotte chicks, 2d Dominique chicks, Black Spanish chicks, White Leghorn chicks, Silver Spangled Hamburg chicks and Bantam fowls; O. Elmore, Brown Red Game, Brown Red Game chicks, Duckwing Game fowls, Black-breasted Game fowls, chicks and 2 pr Toulouse geese; P. Mullally, 2d pr Black-breasted Game fowls and 2d pr Bantam fowls; R. H. Crane, 2d pr Toulouse geese.

Grain and Vegetables.

W. D. Freeman, sk Australian wheat, sk oats and shf oats; R. Crane, sk barley, shelled corn and corn on stalk; C. D. Grover, shf wheat; N. L. Wiswell, shf barley; Perival Milling Co., sk wht flour and sk buckwheat flour; P. Mullally, collection potatoes and single variety potatoes; Rollin Andrews, squashes and pie-plant; L. Vestal, onions; D. M. Winans, pumpkins; Jas. Bloom, beans and peas; C. S. Gibson, sugar beets and blood beets; T. C. Putnam, Mangel Wurtzels; Jas. Bloom, rutabagas and turnips; A. Weissand, cabbage and carrots; E. R. Charles, watermelons and muskmelons; C. S. Gibson, display of products raised by one person on one farm, and canteloupe melons.

Fruits, Nuts, Etc.

I. Parker, largest and best coll. fruits raised in one orchard, coll. pears, peaches; John Meritt, 2d coll. fruits raised in one orchard, apples, single variety apples and 6 varieties apples; Mrs. W. H. Pepper, single variety pears, coll. lemons, coll. oranges; R. Andrews, 6 varieties pears; F. F. Ennis, plums; Morris Bros., coll. grapes raised in one vineyard, foreign grapes. Calif. grapes, largest bunch grapes and coll. almonds; C. Wightman, collection English walnuts, kiln-dried fruit, sun-dried apples, 6 quinces, kiln-dried peaches, kiln-dried plums and raisins; A. H. Cassidy, sun-dried fruit, sun-dried plums, dried plums, seeded; F. F. Ennis, kiln-dried apples; DeLong, Ashby & Co., exhibit canned fruits; Mrs. J. C. Diamond, domestic canned fruits.

Butter, Cheese and Bacon.

D. S. Dickson, fresh butter; W. Page, 2d do.; E. P. Nisson, cheese; R. Crane, ham and bacon.

Wines, Etc.

G. F. Hooper, wines, red wine, white wine, brandy and olive oil; Mrs. A. H. Patty, blackberry wine, do. brandy, do. cordial.

Carriages, Saddlery, Etc.

Wm. Zartman & Co., exhibit carriages, buggies and wagons, top buggy and breaking cart; E. Hopes, two-wheeled vehicle and spring wagon; Ellsworth & Northrup, saddlery and harness; Gus. Walsh, 2d saddlery.

Agricultural Implements.

G. G. Wickson & Co., centrifugal milk separator; W. H. Worth, wine press; L. C. Byce, incubator; Bauer & Co., agricultural implements.

County Exhibits.

Pomona Grange, best display.

Plants, Bouquets, Etc.

W. A. T. Stratton, coll. trees, shrubs and flowering plants, and all other premiums except the following, viz.: Daisy Show miniature garden; Mrs. L. C. A. Hedges, cut flowers and pair vase bouquets.

Special Mention.

Stockton Agricultural Works, fanning mill; B. Carey, fruit grown on adobe land; Mrs. Dr. Burdell, citrons, oranges, etc. Healdsburg collection—M. Redding, hops; F. Cunningham, corn; J. W. Calhoun, oranges; W. P. Warren, corn.

Placerville—Eighth District.

Following are awards for products of agricultural and allied industries at the Placerville Fair:

Horses.

GRADED.—J. Knisley, stallion, 3 yrs. old; J. M. Bell, stallion and colt under 1 yr.; H. E. Barton, stallion, 2 yrs. old; G. L. Blakeley, filly under 1 yr.

HORSES OF ALL WORK.—J. M. Bell, mare; J. J. Miller, stallion.

Roadsters.

CARRIAGE HORSES.—J. I. Reed, buggy horse; W. A. Blakeley, saddle horse; J. Knisley, span buggy horse.

DRAFT HORSES.—James Askew, 1-yr-old stallion.

Cattle.

THOROUGHBRED.—Silas Brown, Durham bull; Jas. Askew, Jersey bull, 3-yr-old cow, 2-yr-old cow; Geo. Askew, bull calf, 1-yr-old cow, heifer under 1 yr.; D. H. Holdridge, Durham bull.

HERDS.—Jas. Askew.

GRADED.—W. Hendrix, 4-yr-old cow; Jas.

Askew, heifer calf; Geo. Askew, 2-yr-old cow, 1-yr-old cow.

Swine.

Jno. Fink, boar, 2 yrs. old; Jas. Gafney, boar, 1 yr. old; T. Gafney, boar, 6 mos. and Chinese sow.

Poultry.

Dr. R. W. Baum, carrier pigeons; Geo. Askew, black Leghorn, brown Leghorn, Pekin ducks, Toulouse geese and largest collection; Marco Varozza, game chickens.

Agricultural Implements.

Baker & Hamilton; Weatherwax & Culbertson.

Vehicles.

N. Wonderly, two-horse wagon and spring wagon.

Grains.

Chas. McCuen, 1/2 bu. wheat, 2d 1/2 bu. oats, 1/2 bu. sweet corn, 10 lbs. flax, do. hemp; Chas. Sibeck, flour; H. Tinney, oats; W. D. Carpenter, 2d shelled corn and rye; Geo. Blakeley, rye, barley and 2d wheat.

Vegetables.

H. L. Bryant, pepper, cucumber, purple egg plant, 2d sweet corn; J. C. Marsh, sweet corn, 2d tomatoes; Geo. Askew, bayo beans, coll. garden seeds, clover seed; I. S. Bamber, 2d Tuscarora corn; Jacob Lyon, squashes, table beets, stock beets, cabbage, 2d watermelon and muskmelon; Philip Kramp, onions, 2d cabbage, 3d potatoes; Stephen R. Tripp, potatoes and yellow muskmelon; P. Wilkinson, pumpkins.

Dairy and Farm Produce.

Jas. Askew, firkin butter; S. R. Tripp, roll butter; Geo. Askew, 2d roll and firkin butter; Mrs. P. Kramp, lard; Mrs. M. Hendrix, 2d lard.

Flowers, etc.

Jno. Waters, coll. flowers in bloom, ornamental plants and grass; Mrs. A. L. Tindall, 2d coll. flowering plants, coll. ornamental foliage, 2d cut flowers, ferns; Mrs. P. Vignaut, bouquet cut flowers; A. Vignaut, 3d coll. flowering plants.

Fruit, Nuts, etc.

GREEN.—J. Waters, blackberries and raspberries; S. Weymouth, 4th apples and 1st plums; I. S. Bamber, 2d figs, 3d appls, 1st pears, 2d peaches and 3d plums; A. S. Cook, 4th plums; J. C. Marsh, 2d nectarines, 2d plums and 1st peaches; Mrs. E. Knighton, figs; T. Fraser, 3d plums, 2d table grapes and 1st display grapes; W. B. Lower, apples; El Dorado Fruit Co., 4th peaches; J. Lyon, 4th pears and 1st nectarines; P. Kramp, 2d plums and 1st wine grapes; W. D. Carpenter, strawberries and display fruit; S. S. Tripp, 2d pears; Wm. Hendrix, 3d peaches; R. McKay, 2d apples, 2d pears, 1st plums, 1st table grapes and 2d wine grapes.

DRIED FRUIT, NUTS, ETC.—C. McCuen, sun-dried apples and plums, 2d dried berries and 1st peanuts; S. Weymouth, chestnuts; Mrs. I. S. Bamber, sun-dried pears, 2d apricots, 1st nectarines, plums, figs, blkbr's, 2d raisins and 1st s'd's raisins; P. J. Isbell, 2d kiln-dried pears, sun-dried peaches, 2d k-dr. nectarines, k-dr. pears and blackberries; A. S. Cook, k-dr. apples, pears, 2d plums, peaches, 2d prunes and figs; Mrs. E. Knighton, 2d sun-dr. plums; T. Hardie, display and quality raisins; H. Tinney, 2d sun-dr. nectarines and 2d sun-dr. plums; J. Lyon, 2d k-dr. peaches; W. D. Carpenter, k-dr. plums, apricots, 2d apples, sun-dr. nectarines, 2d sun-dr. figs, display dried fruit, sun-dr. apricots and soft shell almonds; Aug. Vignaut, 2d sun-dr. apples and pears; A. Eidinger, Eng. walnuts; Thos. Ward, 2d sun-dr. peaches; Mrs. M. Hendrix, 2d Italian chestnuts; Mrs. I. S. Bamber, fruit and prunes in glass and largest display; L. Carpenter, 2d fruit in glass.

WINES AND BRANDIES.—P. Kramp, all premiums.

J. AND J. BLAIR'S SPECIAL PREMIUMS for best display of fruit, R. McKay 1st, and J. C. Marsh 2d.

W. H. H. FELLOWS' SPECIAL PREMIUMS for best display of vegetables, J. Lyon 1st, and C. H. McCuen 2d.

SPECIAL MENTION.—Mrs. E. W. Witmer, 15 var. green beside bottled fruit; F. Veerkamp, display green fruit, oranges, watermelons, muskmelons, potatoes, etc.; C. W. Geoble, exh. fruit; T. Ward, small but excellent display green and dried fruits; J. W. Killough, exh. green and dried fruits and nuts; Mrs. M. Schluter, exh. bottled fruit, put up without heating; W. R. Strong & Co., Sac., exh. green fruit, coll. from different fruit-growers in county; H. Tinney, exh. grapes, Hungarian prunes and persimmons.

Marysville.

In addition to the premiums on live-stock, published in the RURAL PRESS last week, the following awards were made for products of agricultural and allied industries at the Marysville Fair. They are arranged alphabetically, according to the names of exhibitors:

A. F. Abboot, best apples, peaches, plums, prunes, nectarines.

C. R. Boyd, for Farmers' Union, exhibit of wheat; John Burns, cheese; J. J. Bradley, blue Japan game chickens; A. Bligh, brown Leghorns; Mrs. E. Brown, black, white crested Polish fowls.

A. J. Cumberston, sweet potatoes and watermelons; Jos. Chandon, 1st evergreen millets, Egyptian corn; Mrs. G. Crosette, pomegranates; N. D. Coombs, chestnuts on limb, 1st walnuts, Egyptian oats, 2d barley, wheat sheaf.

Mrs. Devolt, flowers and cactus, pair Brahmas.

Mrs. J. Evans, dried apples and blackberries, Japanese walnuts; G. B. Easton, 2d black Langshan fowls.

Miss Lelia Fisher, pomegranates; Mrs. C. Frye, exhibit apples, pears, peaches and prunes; Mrs. M. Farrell, China geese, bronze turkeys, black Spanish fowls, ducks.

Mrs. A. C. Gray, exhibit fruit, dried figs; A. C. Gray, gen. display, grapes; do. raisin and seedless, nuts.

G. W. Hutchins, pears, 1st apples, 1st plums, almonds, potatoes, 2d gen. exhibit; G. W. Hicks, special on peaches, plums and prunes, dried and fresh, 2d pears; T. B. Hull, gen. exhibit wheat, barley, pears, gen. display nuts, pop-corn, almonds, squashes, melons, potatoes, etc.; L. Hall, blackberries; Richard Hoskins, 1st almonds, 1st dried prunes, Hungarian prunes, Japan plums; J. Holister, best var. pears, 1st table grapes, 2d wine grapes.

W. M. Jeffers, green corn, plums, 1st 2 kinds

game fowls and blue Leghorns; Hugh Jones, 1st dried peaches, 2d dried apricots, best quinces, 2d peaches, special on peppers and canteloupe.

Mrs. R. Keck, best gen. exhibit fruits and melons, special on pears, apples, peaches and figs; R. C. Kells, gen. exhibit dried fruits, plums, peaches, nectarines, prunes and apricots; Mrs. H. A. Kells, gen. exhibit Langshan and Leghorn fowls and chicks; Mrs. Mary Karr, oranges, lemons.

J. Monger, table grapes, quinces and almonds; Mrs. Ellen Matthews, roll and crock butter, bronze turkeys; Fred Mahle, Bartlett pears, peaches; S. Marcuse, silk.

C. J. Newton, 5 samples wheat in sheaf.

J. P. Onstott, 2d apples, 1st figs, 2d grapes, 2d varieties, 1st dried figs, wine grapes.

J. H. Purkiss, prunes; Mrs. Frank Parks, 1st pomegranates; G. W. Peacock, peaches and squashes; Mrs. C. E. Putman, 2d butter.

T. Smith, 1st exhibit proper wheat; Sutter Canning and Packing Co., canned fruits; Wm. Stafford, 2d seedless grapes; Elisa Stevenson, tomato tree and pomegranates, 2d oranges; Mrs. R. Salas, pomegranates.

Geo. Thompson, table grapes, banana melons, best bunch grapes; F. Terstege, pomegranates; Mrs. Jas. Taylor, 1st carrots, 1st beets, 2d cheese, Houdan chickens; N. F. Todd, 1st Salt Lake club wheat.

B. F. Walton, Egyptian corn, wheat in ear; J. B. Wilkie, gen. exhibit almonds, walnuts and olives; Mrs. J. B. Wilkie, gen. exhibit fruit in glass, etc.; White, Cooley & Cuts, gopher trap, grain separator, hay and straw cutter.

Shasta County—Redding.

Live-Stock.

Stallions—Best 2-yr-old, S. Charles; 3-yr-old, Jas. D. Campbell; 5-yr-old, W. W. Asberry; 4-yr-old, E. R. Jones; roadsters, 1-yr-old colt, D. N. Honn; span carriage horses, J. S. P. Bass. Yearling Durham bull, C. H. Behrens; 2-yr-old Jersey bull, to months bull calf, cow, M. T. Kite; heifer calf, Geo. Groves. Poland China boar and sow, E. A. Reid. Display poultry, M. T. Kite.

Agricultural Products.

Best barrel flour, A. F. Smith; five lbs. butter, J. S. P. Bass; bushel wheat, bu. barley, six stacks corn, table beet, cabbage, pumpkins, tomatoes, potatoes, bacon, lard, Wm. Hawes; bu. beans, peas, stock beets, onions, F. W. Fish; table carrots, R. Baker; squash, W. W. Williams; watermelons, Jonathan Garner; muskmelons, M. T. Kite; cucumbers and potatoes, J. N. Logan. Special mention, best wheat (not entered for competition), W. C. Deakin; tomatoes, J. B. Campbell.

Fruits—Green.

Best display fruits of all kinds, best five named apples, disp. pears, grapes, F. W. Fish; quince, Dr. J. H. Miller; prunes, P. Seamans; plums, W. W. Morley; peaches, H. Stacker. Special mention—Gen. exhibit, J. N. Logan; apples, J. J. Wheelock; peaches, S. Armstrong; grapes and figs, Williams & Son.

Fruit—Canned, etc.

Peaches and pears, W. K. Reid; blackberries and plums, Wm. Hawes; apricots, Mrs. H. E. Parker; general display preserves, Mrs. J. N. Logan; gen. disp. canned fruits, W. K. Reid; gen. disp. dried fruit, Mrs. J. N. Logan.

Flowers.

Best display, Mrs. P. Glaszer; 2d, Mrs. J. M. Gleaves; 3d, Mrs. J. Culverhouse; bouquet, Mrs. Ed. Reid.

Special Premiums.

A variety of special premiums, which had been offered by different parties, were also awarded as follows:

Best display of farm produce, J. N. Logan; best exhibit of fruits, best display of grapes and best display raisins, F. W. Fish; best display of grain in sheaf, D. N. Honn; best display of dried fruits, J. N. Logan. Special mention, Mrs. B. Oliver, Mrs. D. N. Honn, Mrs. W. K. Reid. Best display of grain thrashed, Wm. Hawes; best display canned fruits, Mrs. W. K. Reid; best display of vegetables, J. N. Logan. Special mention, Wm. Hawes, F. W. Fish. Best display of nuts, F. W. Fish. Special mention, Mrs. E. G. Parker, Mrs. F. M. Swasey. Best display of butter, J. S. P. Bass; largest and fattest calf, Geo. Groves; largest and fattest hog, E. A. Reid; best display of wine, F. W. Fish.

PROVIDING FOR WORKMEN IN OLD AGE.—The plan of the German Government to provide for workmen in their old age will be applied at first only to industrial workmen, of which it is estimated the number is 7,251,000. The minimum pension to be allowed is 120 marks yearly, the State, employers and workmen each contributing one-third of the pension fund, which will be a tax on each individual of three marks yearly. It is estimated that a State credit of 22,000,000 marks will be required. All workmen over 50 years of age, when the bill is passed, will be excluded from its benefits.

FIFTH DISTRICT FAIR.—The San Mateo and Santa Clara County Agricultural Association for District No. 5 will hold its seventh annual exhibition at Horticultural hall in San Jose, October 10th to 15th, inclusive. The list and amount of premiums have been enlarged, great efforts are being put forth to induce people to exhibit, and a fine display is looked forward to. The person making the most meritorious exhibit is to receive a "boom medal" worth \$100.

N. Y. FIREMEN IN S. F.—Quite a large number of Veteran Firemen from N. Y. City, accompanied by Cappa's band, were visiting in this city last week. Their old-fashioned hand engine and unique uniforms awakened a good deal of interest, and considerable hospitality was extended to them.

A MORE NORTHERN CITRUS FAIR.—The Marysville folks are agitating the plan of holding a citrus fair in their pavilion next winter, wherein Shasta, Tehama, Butte, Colusa, Sutter and Yuba counties, and perhaps Nevada and Placer also, should be invited to co-operate.

CENTRAL ARIZONA.

[NO. 4—CONCLUDED.]

[Written for the RURAL PRESS by O. C. WHEELER, LL.D.]

Salubrity and Perpetuity.

The northern portion of Arizona, from about the 34th parallel of latitude to the Utah line, has a general elevation of 4000 to 6000 feet, with mountain peaks twice these heights; and parts of it are covered with pines that will furnish timber not only adapted to ordinary building purposes, but for operations in mines of which the vast mountain ranges are full. This topography generates climatic conditions peculiar to itself, and quite distinct from those found farther south. In Central Arizona, the elevation is from 3000 to 5000 feet less than in the northern portion, which affords the best of reasons for its greatly modified climatic phenomena.

The salubrity of any district will, other conditions being equal, be in proportion to the evenness of the temperature, the dryness of the atmosphere, the steadiness and regularity of the wind, the purity of the air and the amount of clear sunshine. In this view Central Arizona is probably peerless on the American continent, and perhaps in the world. The extensive plains of arid sands lying between the coast of the Pacific ocean and the western boundary of Arizona constitute an almost perfect desiccant to all the sea-breezes that reach these valleys, so that they are, when here, dry to the last possible degree. This, with other causes, produces an atmosphere so extremely void of all humidity that absolutely no dew ever falls in Salt River valley. And yet the breeze is regular nearly every day in the year, lowering the temperature and affording measurable relief from undesirable heat that may have obtained during the day. There are no swamps or quagmires exhaling malaria; no chemical compounds in action to fill the air with poisonous fumes; no sulphurous lava flows from burning mountains or gaseous exudations from pits, surcharging the air with asphyxiating ingredients. The air is as pure as the proper mixture of oxygen and hydrogen can produce—a perfect life-giving inhalation at every breath.

The temperature is wondrously even. No chills from banks of snow, no wet from sloppy breaking up of frozen ground, no taking colds to plant tubercles in the lungs, from sudden shifts of heat and cold. They never come. Men in the harvest-field make full hours and do heavy work with Fahrenheit at 110° in the shade, suffering less from heat than they would in any of the seaboard or Mississippi Valley States, with the thermometer at 90°. There is no record of a case of sunstroke since the whites began to occupy the Territory. And yet there are no statistics showing that any portion of the earth has a greater number of cloudless days with clear sun than Central Arizona. In other words, no section of the country enjoys more cloudless, clear sunshine in the year than this district. In short, the elements essential to the most perfect healthfulness are here so combined as to insure a state of salubrity equal to the most favored spot on earth.

Perpetuity.

Facts may indicate, and philosophy may show, and logic may prove beyond all doubt, that an enterprise, or undertaking, or a course to be intelligently entered upon and energetically and persistently pursued, will—must—be profitable; and yet the careful, the good business man will ask, "Will it last?" "How long will it continue to be thus profitable?" "Has it, inherently, the elements of certain perpetuity?" It may be a placer mine of gold of incomparable richness, and yet, if vigorously and persistently worked, it may be—it surely will be—long, "washed out." It may be a ledge of gold or silver-bearing rock, rich and extensive, and may rapidly produce fabulous wealth; yet its continual development will surely exhaust and destroy it. It may be a timber belt containing the elements of untold millions of lumber, still, constant depletion will cause constant exhaustion, and, in time, its utter destruction. Hence the pertinence of the careful man's question, "Will it last?"

To this query, the answer in general is, the longer land is properly cultivated and properly fertilized, the stronger and more productive it becomes. As applied to Salt River valley, the answer is, while the mountains surrounding the valley continue to disintegrate under the operation of the elements, and while the detritus thus eliminated continues, under the law of gravitation, to descend and work its way over the plains, so long will there be perennial additions to the amount of the producing element, in a state of refinement and assimilation. And so long as the water flowing from these mountains, holding in solution the debris which is always present, in some degree is spread upon the land in irrigation, so long will the fertilizing properties of the soil continue to receive additions, and its fecund power will continue to be increased. And so long as water containing more or less of salts and ammoniac compounds, as all water does, is used for irrigating purposes, and so long as the process of cultivation continues to throw up the soil, exposing it to the indispensable and ever-fructifying influences of the atmosphere, so long will the soil continue to be refreshed and invigorated, and prepared to give larger reward to the labor of the husbandman.

While the conditions just enumerated are in perpetual activity, can there be any failure in the great substratum of all agricultural prosperity, the producing power of the soil? Is not perpetuity in this department absolutely guaranteed? "How long will it (not) last?" But the inquirer (very naturally) asks, "Will prices continue, and hence profits not be reduced?" Suppose they

Ruler of all things has stamped the financial profits of tilling the soil in Central Arizona with the changeless benediction, "esto perpetua," "be thou perpetual," thus assuring to this enterprise absolute perpetuity.

Condensations and Conclusions.

Raisin-making in Salt River valley has these advantages over any other place where the industry has been prosecuted, almost an entire immunity from rain during the whole drying season; and no dew ever falls. This continues long enough for the second crop (which is often nearly equal to the first) to ripen and be entirely cured; thus making nearly double the amount of raisins that could be made from the same amount of grapes in Southern California, where rains are so early and dews so heavy that producers seldom attempt to dry the second crop.

Raisins made by the pure heat of the sun properly applied, cannot fail to be superior to those made by artificial heat, or those whose drying is interrupted by dews and rains.

There are few lands where soil and climate so combine as to make almond trees good bearers. But in Salt River valley they do, and the profits of the crop are quite equal to those realized from grapes, or any of the fruits above enumerated.

Alfalfa, green or in hay, makes sweeter, richer, better beef, pork and mutton than any other known feed. Animals turned to alfalfa after they have ceased to fatten on the mountain ranges, or upon the common grasses, or on the ordinary feeds used for the purposes of fattening, take on fat with great rapidity, until

It is not known that any body of land taining 350,000 acres in any part of the world has a more efficient combination of natural and artificial facilities for irrigation than the Salt River valley.

Railroads are centering in this valley that will, in a short time, place it on a par with the most favored spots in the country for communication with the whole world.

The minerals shown in 1885 at the World's International Fair, at New Orleans, from the mines of Arizona, held the first place among all exhibits, from every part of the world.

The alternate sections of land originally granted to the Texas & Pacific R. R. Co. on certain conditions, 40 miles on each side of its line, through the entire length of Central Arizona, having been adjudged forfeited by the company, have all been thrown open to settlement, aggregating 8,960,000 acres.

Agricultural lands in Salt River valley, taken up less than five years ago at \$1.25 per acre, and covered with water rights at \$7.50, are now worth \$30 per acre, exclusive of all other improvements. Town lots in the city of Phoenix are now selling more than 500 per cent higher than the same lots sold for five years ago.

Labor is demanded all the time, in all departments of manual and mental effort, and always commands good wages.

Conclusions.

1. People in poor health will not be likely to find a place more conducive to the restoration of human vigor (physical or mental), and the assurance of health and happiness during the future of life, than at Central Arizona.

2. Investors will find very few fields where returns will be so rapid, and profits so great, and accumulations so continuous.

3. Men of small capital and great will-power, in the use of good muscle and common sense, can nowhere apply their resources to better advantage than in Salt River valley.

4. A man with a little money can purchase more land, that will, in five years, be worth \$100 an acre, than in any other place we know.

5. A woman skilled in any of the arts, or in any kind of labor, will find, in the city of Phoenix and its vicinity, more opportunities for desirable employment, either in her own business or in the service of others, than elsewhere within our knowledge.

6. We know of no place where people in early life, with good habits and per-

severing industry, even with limited means, can so easily secure a good living, and so rapidly accumulate a competence.

7. A country abounding in such universal resources cannot long remain without a dense population, and that population will rapidly achieve wealth.

8. Such laws as here obtain, in the hands of an intelligent people, with such a system of free education, cannot fail to sustain order and promote the culture of high moral virtue.

A TOWN WITH EIGHT RAILROADS AND NO HOUSES.—It is not often that eight railroads are at the same time under construction to any one place, however important it may be. And yet our correspondent, writing from Estilville, Va., points out the fact that eight roads are now either actually being built, or soon will be, all to meet at a place where a town has not yet been laid off even. Big Stone Gap is the name of this remarkable place. It is a great gap in the range of mountains dividing Southwest Virginia and Eastern Kentucky, and of necessity the railroads building in that direction must cross the mountains at this place. It is one of nature's marvels. Just by the side of the river, which has broken its way through this great mountain range, there is said to be a most beautiful site of 1200 acres for a town. Here it is proposed to build an industrial town, and with the unlimited supplies of fine ore and the Elkhorn coking coal and limestone in abundance, this place ought to grow very rapidly under judicious management.

EGGS IN THE ARTS.—Eggs are used largely in the arts. Albumen is made from the white and egg oil from the yolks. The egg oil is used for oiling leather and wool in woolen-mills. Then there are egg pomades, desiccated eggs and preserved eggs (for farmers' use). Egg albumen sells in France at the rate of 75 cents per pound.

ALFALFA PASTURE ON BRILL'S RANCH, SALT RIVER VALLEY, ARIZONA.

are reduced 50 per cent, will they not still be large? Where else can equal profits be continuously depended upon? There are, however, abundant and reliable reasons why prices should not only continue, but should continue to increase, and constantly enhance all legitimate profits. Here is a territory, large as a first-class principality, a small empire of itself, a very large proportion of which will continue to interest and occupy a numerous population in pursuits other than the cultivation of the soil; indeed, where the soil cannot be cultivated. The extensive mountain ranges and elevated plateaus, while under conditions forbidding agricultural pursuits, will reward the lumberman, the miner and the herdsman, in all the future, and they must receive their green supplies from the comparatively few and circumscribed valleys. This will insure a continuous demand for fresh fruits and vegetables, quite equal to the most increased supplies. It is a fundamental fact, upon which assured hope of continued profits in the production of raisins, nuts and citrus fruits relies, that there are only comparatively few and limited districts on the face of the whole earth where they can be successfully and profitably produced, and that these districts can by no supposable circumstances be augmented in number or enlarged in area; that when these districts are occupied and developed, the maximum supply of these articles will have been reached, while the consumers will be continually multiplying, and hence the demand increasing throughout the world. Add to this the fact that as civilization advances and luxury supplants the use of bare necessities, the demand for these more delicate and desirable articles of food will be enlarged to such a degree that, instead of lower prices and diminished profits, there will surely be enhancement of both.

Now we submit that the above unquestionable facts and immutable principles, examined in the light of nature's invariable laws, give to an unprejudiced, intelligent mind all needed evidence that the decree of the

all desire on the part of the owner for more fat ceases. Salt River valley grows alfalfa without interruption 12 months in the year, and thus produces a perennial supply of meat, not surpassed in any market in the world.

Grapes come into essential bearing one year earlier than in any other country where they are extensively grown, and are ripe, fit for market or for raisin-making, from 14 to 24 days earlier in the season than anywhere in California.

There are now in the Salt River valley more than 500,000 grapevines and more than 250,000 fruit trees in successful rapid growth, and room for many millions more.

In Central Arizona extremes of cold are never known, and a very hot day is so seldom that laborers in any department of life can make full hours every day in the year without inconvenience.

Vegetables of every desirable variety attain the highest quality, and size enough, with least possible attention.

Citrus fruits, though not yet so extensively planted as in Southern California, have been sufficiently tested to dispel all doubt of their future abundant production and profit.

Indian troubles, which never affected more than one-tenth of the Territory, and that in the extreme northeast corner, a hundred miles away, are unquestionably disposed of forever.

The Arizona canal, at a point near its center, only a few miles from the city of Phoenix, is dropped about 15 feet, affording more than 1500-horse power, sufficient to run a score of large manufacturing establishments, supplying Phoenix and other towns with light and heat and everything dependent upon machinery and mills for reducing the ores of a multitude of mines within practical distance.

Sand and gravel, in immense quantities, are, by the floods of each year, washed down and deposited in the immediate vicinity of Phoenix sufficient in quantity and quality to meet all demands of construction for a large city.

POULTRY YARD.

American Langshan Club.

The following are the most important rules of the club:

1. That a poultry club be and is hereby established, to be called and known by the name of the American Langshan Club.
2. That the object and purpose of this club is the honorable protection and extended cultivation of the Langshan fowl, as introduced from Langshan, China, into England in 1872, and from thence into the United States in 1878, as well as to protect by co-operation the interests of the breeders of this most useful fowl.
3. That to promote the above objects as many and as liberal prizes as the funds will permit be offered for the competition of the members of the club at such leading shows as the executive committee may determine, and that a notification of such shows be sent to each member.
5. That the power of admitting members shall be vested in the executive committee, and shall be by ballot—two adverse votes to exclude.
7. Any person may become a life member, subject to rule 5, upon the payment of \$5 at the time of joining the club, or at any time after becoming a member, but such sum shall not include any previous amounts paid.
8. That any member, who in the opinion of the executive committee behaves dishonorably, may be expelled by a two-thirds vote of said committee, but not until said member has had an opportunity to defend himself.
9. That any member who shall be accused or convicted of breeding cross-bred birds as Langshans shall be dealt with as provided in Section 8 of these rules.
15. That a register of all imported and prize-winning birds belonging to the members shall be kept by the secretary, with a list of prizes won, and when sold notice shall be given the secretary, with the name of purchaser, and should said purchaser desire a list of prizes and record of same, he can obtain it by the payment of \$1 to the secretary, to be placed in the funds of the club.
16. That all members shall make a report to the secretary of all importations and prizes won, and also the score, date of show and by whom judged.

Following are the officers: President, F. A. Mortimer, Pottsville, Pa. Vice-Presidents: Capt. R. W. Sargent, Kittery, Me.; W. O. Dakin, Toledo, O.; H. H. Forester, Denver, Col.; E. P. Kirby, East Chatham, N. Y.; W. H. Hamilton, Danielsonville, Conn. Secretary and Treasurer, A. A. Halladay, Bellows Falls, Vt. Executive Committee: J. Stewart Kennedy, Cowanville, P. Q. Ca.; P. H. Jacobs, Hammoniton, N. J.; H. H. Stoddard, Hartford, Conn.; R. A. Sargent, Kittery, Me.; G. W. Bowly, Winchester, Va.; W. L. R. Johnson, Buckley, Ill.

Preserving Eggs.

When farmers or poultry dealers only wish to keep eggs in a good condition for a few weeks, it is not necessary to use any particular mode of preservation. All that is requisite is to have a good cellar, larder, or even closet, fitted with perforated shelves. The eggs should be placed broad end downward on these shelves, but they may with advantage be turned about twice a week, keeping them, however, almost all of the time with the broad end downward. The reason for this is that when so kept the air space does not increase in size, and the eggs seem to keep better. It is a very good plan to arrange the eggs in uniform rows from front to back, so that those laid first can be used first. Another plan much advocated by some writers on the subject is to keep the outside air as far as possible from the egg. This is done by wrapping each egg in wadding or cotton wool, packing them in jars and sealing a waxed paper over top. But it is no less essential in this case that the eggs shall be stored in a cool place, for eggs are not in so much danger from the germs of decay in the air without as from those within the egg itself. And these will certainly grow and destroy the quality of the egg, however carefully it may be covered and sealed, if the necessary condition of a high temperature is furnished.

Gypsum is said to be a good preservative for eggs. It is stated that they have been kept, packed in finely powdered gypsum, for six months. But this was in a cool place, and perhaps the cool air had as much to do with keeping the eggs as the gypsum. In fact, whatever substance is used for packing the egg, the place of storage should be cool for the reason that we have given above, to protect the egg from the development of its own internal germs.

The most generally used mode of egg preservation is that of keeping them in lime-water. This is undeniably the best for practical purposes, whether for house use or for sale. It involves the least expense and the least trouble, and has the least objectionable effect upon the taste of the egg. Pack the eggs, with the small end down, in casks or jars, and then pour over them a solution of lime-water and salt. Take a bushel of lime to 50 gallons of water, and add six quarts of salt. First slake the lime with part of the water, then add the rest of the water and the salt. Stir at intervals, and when

the solution is cold and the sediment has settled, dip out the liquid and pour it over the eggs.

The objection to packing eggs dry in sawdust, bran, oats, and the like is that the egg absorbs through its porous shell something of the musty taste that seems to belong to these substances. This may be prevented, however, by dipping the eggs first in a hot solution of alum. When cool they may be packed in any dry substance, the pores of the shell being now so entirely closed that no gases, taste, or smell can be absorbed.—*Inter-Ocean*.

Farmer's Steam Generator.

We give on this page an engraving of a patent steam generator and engine, made by E. H. Farmer of Gilroy. It is a compact machine, especially adapted for running printing presses, sewing machines, grinding feed, cutting hay,

FIG. 1.

ALBERT'S AUTOMATIC SAFETY ELEVATOR.

sawing wood, pumping water, etc. It is adapted for any purpose where small power is needed on farms, ranches, mines, etc. The boiler is a four-horse power and engine three, but other sizes than the one shown are to be made.

This machine occupies but little space and is easily accessible in all parts for cleaning, inside and out. The side plates rest on hooks at the bottom and fit in a recess at top, and can be lifted off, the soot brushed from tubes, and plate

Albert's Automatic Safety Elevator.

Henry Albert of Crescent City, Del Norte county, in this State, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency an automatic safety elevator which is on an entirely different plan from any heretofore constructed. Engravings of the device are shown on this page.

In the elevator well or shaft on each side are guides formed of double uprights between which are placed at regular intervals stout bars or pins. The vertical side portions of the elevator frame fits between these guides as shown in Fig. 1 of the cuts, but in such a manner that the cage slides up and down without striking the pins or bars.

Under the car on each side are the safety catches. They consist of stout bars pivoted on side timbers of the frame of the cage. Their outer ends project between the guides and into the vertical plane of the rack bars, so that they

FIG. 2.

Safety-Catch Holding Cage.

come into contact successively with said bars, but being pivoted they slip by them and by vibration return to an equilibrium. Small pivoted weights, forming part of the catches, serve to return the catches to a horizontal position after they pass each bar.

When the cage is ascending or descending at a rapid rate of speed, the ends of the catches slip by the rack bars and present no obstruction. But in descending, when for any reason

FARMERS STEAM GENERATOR AND ENGINE.

replaced in a few seconds, without tools. The water tubes each have a plug opposite the end of tube, so the scale or sediment can be readily removed without disturbing the tube. The water spaces at the front and back also have plugs for cleaning the inside. Any one that can use a wrench can clean this boiler inside and out in a few minutes. This is a novel feature, but essential to the life of a boiler, as the heat boiler will soon burn out with bad water if there is no way to keep it clean.

The boilers are thoroughly tested before leaving the shop by cold-water pressure, and are warranted in every respect. The engine is a model of compactness and has no delicate parts to get out of order, but is a good, plain, everyday engine, capable of doing a great deal of hard work without repairs. The boilers are sold with or without engine and are fitted complete and ready for water and fire.

THE Nineteenth District Fair is to be held at Santa Barbara, Sept. 27th to 30th, inclusive. We gratefully acknowledge the receipt of complimentary tickets, and hope some representative of the RURAL PRESS may be able to attend.

weights with the catches, whereby the proper operation is rendered more effective and certain, and the speed of the cage regulated, the pivoted balanced-stops for checking the vibration of the catches when operating normally, the fixed stops for holding the catches when thrown to position to stop the cage, and other details of construction. A special feature is the sliding spring-controlled or cushioned cross-head or bar by which the reversible catches, the fixed stops and the balanced stops are carried, and by means of which the jar occasioned by the sudden arrest of the cage or car is wholly obviated and relieved. This device is quite simple and appears to be effective.

The Buena Vista Rancho.

Hiram Corey has sold the Buena Vista Rancho, consisting of 7725 acres, to Tyler Beach of San Jose and J. C. Hoag of San Francisco, who represent a syndicate, at \$30 per acre. It is situated on the south side of the Salinas river, about five miles from Salinas City. Mr. Corey has occupied this rancho as owner or under lease for 14 years, and during that time, by a system of mixed farming, has acquired an ample fortune. We have seen a map of the rancho, showing subdivisions that would be most practicable in parcels from 100 to 1500 acres for making homes. It is the intention of the managers of this enterprise to make 25 lots or subdivisions and sell the same on easy terms, say one-half cash and the balance in one and two years at 7 per cent interest. Our knowledge of this great Salinas valley warrants us in saying that there is no large tract of land more suitable for the purpose. Living springs and never-failing streams run through various portions of the rancho, and there is over 5000 acres that is the choicest tillable land. There is a fine bearing orchard of ten acres and a vineyard of six acres. Cuttings set out this year have now, in some places, large bunches of grapes. On the river-bottom there is a field of potatoes that will produce over 200 sacks, and sugar-beets that will yield over 30 tons to the acre. If our large land-owners would follow the policy marked out by Messrs. Hoag & Beach, we should be in a condition to retain some of the desirable Eastern emigration pouring into our State. We have been laboring for years to settle this magnificent valley in small holdings, and we regard this move as an earnest of what will be the best policy to pursue in order to bring about that desirable consummation.—*Salinas Index*.

All sufferers with such chronic ailments as liver disease, dyspepsia, blood diseases, crutch, consumption (scrofula of the lungs), and kindred diseases should know that Dr. Pierce's "Golden Medical Discovery" is their best friend in such deep affliction. It comes to soothe, alleviate and cure.

Don't You Know

That you cannot afford to neglect that catarrh? Don't you know that it may lead to consumption, to insanity, to death? Don't you know that it can be easily cured? Don't you know that while the thousands and one nostrums you have tried have utterly failed, that Dr. Sage's Catarrh Remedy is a certain cure? It has stood the test of years, and there are hundreds of thousands of grateful men and women in all parts of the country who can testify to its efficacy. All druggists.

They Will Not Do It.

Those who once take Dr. Pierce's "Pleasant Purgative Pellets" will never consent to use any other cathartic. They are pleasant to take and mild in their operation. Smaller than ordinary pills and inclosed in glass vials; virtues unimpaired. By druggists.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Important to Tree Planters.

One hundred and twenty-five thousand Fruit Trees for sale at a bargain, consisting of Apple, Pear, Peach, Apricot, soft and hard-shell Walnuts; also 2000 Fan-Leaf Palms. Sales will be made in lots, or the Nursery and stock will be sold on the most liberal terms as to price and payments, or will be exchanged for real estate. Inquire of J. M. Hixson, Real Estate Agent, 75 N. Spring street, Los Angeles, or address the proprietor, Milton Thomas, P. O. Box 304, Los Angeles, Cal.

The Lubin Pulverizer.

Practical Tests and Demonstrations of Value.

The inventors of California have made many important contributions to the progress of improved agricultural implements and machines. A number of these inventions involve essentially new applications of mechanical principles and new methods of operation. The inventions have in many cases resulted from the peculiar conditions and needs of California agriculture, but will have great value as well in working the soil of other agricultural regions. Thus California makes a contribution not alone to her own advancement but to the advancement of agriculture everywhere. It is quite certain that in mechanics as applied to agriculture, California is doing important things for the

perfect mulch to prevent loss of moisture by evaporation and to keep the lower soil in proper condition for root penetration and nourishment. Directly opposed to this is the cloddy condition of the soil which is produced by imperfect cultivation. The clod is the rock upon which agricultural enterprise is wrecked. It is proper, then, to inquire into the nature of a clod and its evil work. Mr. E. C. Thorn, formerly farm superintendent of the Ohio State University, now associate editor of *Farm and Fireside*, says:

"Clods are just so much wasted land, and this is true whether the clods lie upon the surface or are buried in loose earth. This lesson has been learned slowly, and at enormous expense and cost in unprofitable crops."

This has been aptly illustrated by Prof. Hilgard of the State University, than whom there is no better authority on questions relating to the conditions

proved harrow, cultivators, clod-crushers and rollers, there has been great progress made in clod-crushing, but in certain particulars these implements have not reached perfection. What is required is something to crush and pulverize the clods and to thoroughly mingle and mix the soil, not only on the surface, but below, as deep as the ground has been plowed. With the ordinary harrows or other implements commonly used, clods at the bottom are left undisturbed, and the clods on the surface pass between the teeth or disks and are merely rolled from side to side. In certain naturally mellow soils, however, these implements do very satisfactory work. In refractory soils, rendered so from the tendency to cement the particles together, something essentially different in mechanical principles was required to pulverize the soil. This Mr. Lubin set himself to work to secure, and after a number of experiments

2d. A series of wheels with chisel steel teeth. These wheels revolve independently on a steel shaft. The teeth project from the wheel about six inches and are about four inches apart, and as the machine is drawn forward these chisel-shaped teeth revolve between the curved spring teeth or crushing bars in front.

The entire weight of the machine and that of the driver is placed on top of these revolving teeth, in which manner they are forced into the ground. The depth of cultivation is regulated by the depth to which the spring teeth are set.

The curved spring teeth raise the clods and earth from beneath the surface, and are then caught by the revolving teeth and cannot pass through without being mingled and crushed, so that not only the surface clods, but those from beneath, are thoroughly pulverized and mixed, thereby making a perfect seed-bed.

PULVERIZING THE SOIL WITH THE LUBIN PULVERIZER AND CLOD CRUSHER.

world's progress as she is ministering to other directions of human advancement.

A new illustration of this general truth may be formed in a new implement of tillage, invented by David Lubin of Weinstock & Lubin of Sacramento, and patented through Dewey & Co.'s agency. Mr. Lubin's experience in working his soil for orchard and vineyard was that a good condition of tilth was attained only at a cost of much time and the use of a number of implements, and he set himself to work to determine whether some different implement could not be devised, which would much more thoroughly pulverize the soil and do it quickly and cheaply. He worked earnestly upon this problem, and though his first attempts at constructing such a machine were not altogether successful, modifications readily suggested themselves, and now it is the verdict of scores of practical farmers, who have carefully studied the machine and its work, that the Lubin Pulverizer is a practical success and has many important advantages over old cultural implements.

Before alluding to the tests made during the State Fair, and the verdict of those who witnessed them, we desire to introduce a general description of the machine and the philosophy of its operation.

Philosophy of Tillage.

The production of a fine tilth is essential, first, in securing condition of soil which admits ready extension of the rootlets of the plants and thus making available all the resources of plant food in the land; second, in retaining moisture in the soil by preventing evaporation from the surface; third, in securing a condition of soil fitted for the continual absorption of moisture, vapor and fertilizing properties from the atmosphere. There may be other considerations, but these are the most important.

There are two extremes in soil conditions—one of perfect surface tillage, which may be called *dust*; the second, of defective tillage, which may be called the *clod*. These are the antithesis in soil-working. There are soils and seasons in which working the surface to dust is not desirable, but it is beyond question that in California, when the heavy rains are over, the production of a dust layer (as nearly as possible to attain it) at or near the surface is the most

and properties of the soil. He says: "Imagine a sponge, representing the loose soil, to be saturated with water; and a hard-burned brick representing the hard crust (or equally a hard clod). This hard brick placed upon the top of the wet sponge will

has reached great success, as will be seen farther on. At first we will give a description of the parts of Mr. Lubin's machine, which, in connection with the engravings on this page,

THE PULVERIZER REVERSED WITH SPRING TEETH IN REAR.

take all the water from the sponge; yet if the brick be soaked in water, and a sponge be pressed on the top of it, the sponge will not take up a particle of the moisture from the brick."

It is thus seen that a clod is not merely a mass of useless soil, interfering with the proper functions of the roots of plants, and preventing the passage of the water of the soil to them, but that it is a robber, ready at all times to take the moisture from the soil, but not willing to give it up again when needed.

Reducing Clods

From the earliest times the effort of the cultivator has been toward the reduction of clods to tilth. From the time of the first progenitor of the harrow, which was a branch of a tree drawn over the sod, down to the latest im-

will enable the reader to understand its mechanism and operation.

Lubin Pulverizer and Clod-Crusher.

The machine consists of two principal parts: 1st. A set of heavy spring teeth fastened to a pivoted cross-bar in front of the machine, as represented in the large engraving on this page. These spring teeth may be set to run any required depth by means of the lever shown.

These spring teeth serve the purpose of stirring up the ground, breaking the crust, raising the clods, and as crushing bars, being located so that the teeth of the revolving wheels pass between them.

When the land is broken and has no top crust, and only surface clods are to be crushed, or if in mellow lands the soil is to be stirred and mixed, the tongue or pole of the machine can be reversed, as shown in small engraving on this page, so that the spring teeth or crushing bars will be in the rear, with the back of the curved teeth forward, serving then as crushing bars for pulverizing surface clods and mixing the soil.

In this position it will be found lighter for the team, as the spring teeth are not in the ground. It can be used with wonderful effect as a cultivator in orchards, vineyards, and for corn.

This machine will reduce the clods and pulverize stubborn soil. Another advantage is that it makes no ridges or furrows, but levels down all such, leaving the ground smooth, soft, and mellow.

Practical Tests During the State Fair.

At different times the Lubin Pulverizer has been shown in operation at the Agricultural Park. A piece of hard, dry ground which has not been plowed for years was coarsely broken up and then worked with the pulverizer. The clods were drawn to the surface and broken up but not reduced to fine tilth. The machine in the form shown with spring teeth was not calculated to break clods from dry plowing. Mr. Lubin has a machine with *fixed* instead of spring teeth which will reduce such clods, and has, in fact, ground up clods from a traveled road which was plowed up as a test of its power. But the machine shown was planned to work in what might be called cultivated ground or land which had been plowed during the previous winter. It did, however, reduce the clods to egg or walnut size and bring them to the surface of the ground, while beneath them was a layer of well-pulverized soil, thus demonstrating the efficiency of the machine even on dry plowed land.

A number of leading agriculturists being favorably impressed by this test desired to see the machine at work in the vineyard and orchard and to examine the effect upon trees and vines upon soil which had been treated during the season with the pulverizer instead of the usual harrows, cultivators and clod-crushers. Mr. Lubin readily consented to arrange an op-

portunity for such test and examination, the results of which we will now briefly describe.

Weinstock & Lubin's Ranch

Is situated near Mayhew's station, on the Folsom branch of the Central Pacific, about nine miles from Sacramento. It is on the bench above the American river bottom, and is what is known as timber land. The soil, when properly treated, is well adapted to trees and vines, as their growth shows, but it is of a character to test well the powers of any pulverizing apparatus. The ranch has about 200 acres in trees and vines.

One day this week there gathered on the ranch about 20 persons, some of them well-known farmers, among whom were H. M. La Rue, Geo. W. Hancock and Chris Green, directors of the State Board of Agriculture, Daniel Flint, Senator Routier, Thos. McConnell, Jas. Rutter, and others of Sacramento county; Dr. Grattan of San Joaquin; E. W. Steele of San Luis Obispo, and others from different parts, including representatives of the press. A long time was spent in tramping around after the machines, watching their operation, stopping and starting them frequently, so that every point of action could be discussed, etc. Two machines were used, one with the spring teeth in front and one with the teeth behind, as shown in the two engravings on this page. It was found as claimed that operating with the spring teeth in front tore up the soil, brought the lumps to the top and ground them down by the leverage of the revolving teeth, using the spring tooth as a fulcrum. There was complete unanimity of opinion that for breaking up crust after rain, or otherwise securing thorough tearing up of the soil, lifting out and crushing of the clods, on land which has been previously plowed, the machine was successful beyond any known implement for this purpose. The same complete success was awarded to the machine with the spring teeth behind for thorough stirring and mixing of the soil and producing a fine layer upon the surface, such as is desired in summer cultivation. Thus arranged, the machine also exercises leverage upon the clods, and the revolving teeth also comminute the soil by throwing it against the spring teeth in the rear, breaking mellow lumps by pressure against these teeth. As the machine goes along the fine dirt falls in a shower behind it like the water from a stern-wheel river steamboat. The surface is thoroughly mellowed and disintegrated.

The effect of the use of this pulverizer in Weinstock & Lubin's vineyard and orchard was very apparent. Moisture was found by the hand or foot very near the mellow surface. Vines showed their abundant supply of moisture by the immense growth they had made even in this dry year and were still growing freshly even so late in the season. The orchard trees also looked fresh and vigorous, still holding their leaves well. This result is just what might be expected from thorough cultivation and good pulverization of the surface during the summer. The novelty lies in the apparatus by which such thorough culture was secured. The importance of the novelty is seen by the cost at which such a condition is secured. Weinstock & Lubin assure us that their cultivation, using the best old-style implements they could find, was much more per acre than with the new pulverizer, and much more complete work was done. But beyond the actual cost of work there is another matter which is often a more important factor, and that is time. With a single implement to use after the plow, the land can be very quickly worked, which is a very vital consideration when the soil is just right for working, and a few days' drying, sun or wind, hardens the crust and evaporates the moisture.

What They Think of It.

The expressions of opinion showed what a favorable impression had been produced by the investigation of the machine and its work. We have space for but a few of the remarks of which we have note:

H. M. LaRue—"There is no doubt of the value of the machine as a cultivator upon land properly plowed. In the orchard and vineyard it is a success. I believe it will also be found of use in wheat land, but it will have to be tested to determine that point. It evidently runs light and will be a durable machine."

Senator Routier—"If we had such a machine on every ranch, we could get along without irrigation. It works up clay land so that it looks like well-cultivated river-bottom. It does the work of at least two tools at one operation, and is, therefore, a great saver of time and teams."

Doctor Grattan—"I don't look at it as fit to break land, but for thorough pulverization of the soil to the depth plowed, it is a great institution. I am very favorably impressed with it in this direction."

Daniel Flint—"I am more than pleased with what I have seen of this machine. I can plainly see the benefit of its use on land which has been worked with it, as compared with that which has not. I believe it is a thoroughly good machine, and will be found of much value in the hopfield."

Thomas McConnell—"This machine is a new illustration of what can be accomplished by concentration of mind on one's work. I regard it as a great improvement in implements of tillage."

James Rutter—"I was inclined to disfavor the machine when Mr. Lubin showed me the model, but when I saw it in the field I experienced a complete change of mind. It is thoroughly new; I never saw anything like it nor

anything with which soil can be cultivated so well and so cheaply."

Mr. Hancock, Mr. Steele, Mr. Green and others also spoke favorably of the pulverizer and its work. The demonstration given was certainly a success.

The Pulverizer in the Grainfield.

Though the test described above was upon orchard and vineyard land, it is our opinion that the machine may prove of great value in the grainfield. Although it is not calculated to handle clods which have been baked all summer, it can be used after the spring plowing of summer-fallow, and if this is done, the soil can again be worked by it for dry-sowing; and it is intended to attach a seeder so that the soil can be stirred and the seed sown and covered all at one operation. This is a point upon which experiments will no doubt be made as soon as possible.

The machines are manufactured by P. P. Mast & Co. at Springfield, Ohio, and will be sold by the San Francisco branch of this firm at 31 Market St., S. F.

A Returned Colonist's Account.

[Our long-time friend and contributor, Mr. Rumford, who went down to Sinaloa last December with L. A. Gould and others, has but recently come back to San Francisco and sends us a brief review of the situation at Topolobampo. His version differs somewhat from others that have got into print, and we deem it of sufficient interest to lay before our readers.—EDS. PRESS.]

Back From Topolobampo.

EDITORS PRESS:—As we have finished the work for which we went to Topolobampo, Mexico, and returned home, you, with our many friends all over the State, will be pleased to hear of our safe arrival and that the statements made by unfriendly parties are essentially untrue. We found in Sinaloa a climate hard to excel—one in which we lived practically outdoors, without house or tent—simply a protection from the sun, made by covering a framework of poles with brush and soil, with thin curtains stretched around to shield us from the public eye. Much of the time the boy and I used not even this, but slept soundly on the damp sand of Los Copos island, so near the water that an extra high tide has often forced us to move higher up. Such is the perfection of the climate that, living so, we never took cold nor had any rheumatic nor other troubles, except disturbance of digestion or inflammation of the bowels, caused by the use of too much strong food, like corn and sugar, at a time when the supply of fruits and even vegetables failed us, because there were some 500 persons, largely women and children, where only 100 able-bodied men were needed.

The fine harbor, with its variety of fish, will ever find persons glad to remain and enjoy them, while the land only needs a supply of water to produce abundantly; but whether men can be found to work successfully in a co-operative way, as Mr. Owen proposes, is a question time alone will decide. The ease with which one can shirk, when there is no competition, has not yet found a remedy there; so little work is done in proportion to the laborers—still they may do much better when the number is reduced. About 73 left when I did, and 100 more could well be spared, after which 100 would be left—a plenty for the experiment.

After this Mr. Owen will select from those who apply, and thus send only such as are suitable to go there. Dr. Schellhouse and L. A. Gould, the company's agents in San Francisco, will send another supply of provisions on next trip of the Newburn, August 8th, also improved nets for fishing.

When you hear some returned colonist venting himself against Topolobampo's enterprise, remember what hundreds of hard men looking for soft places said of California between 1850 and 1860. We have yet to hear one person say as much against Sinaloa; still we advise people not to go there until those who are there have fully prepared the way, which may take a year or more.

As to the question about people starving to death there, my testimony is (and I closely watched the cases so reported) they died from too much food and medicine combined. Their first trouble came from excessive use of strong food, like corn and brown sugar, both inflammatory in their character if taken in excess, causing inflammation of the bowels and fevers which are continued and increased by soap, and other preparations continually fed to the sick ones with the idea of sustaining them until the medicine cures (?). I had charge of only three cases of the kind, and each of them was entirely cured by a complete fast of five days, followed by very temperate living. Those who died possibly might not have used so much corn and sugar had fruit been as plenty as it should, and probably will be in future. The most productive source of all trouble is panache—a dirty brown sugar made into cakes and eaten as maple-sugar by nearly all in excessive quantity. For such a climate all sugar is objectionable.

After all is said, the deaths, including small-pox, were but 16 out of 500 in eight months. The sickest people were the doctors and those who employed them. The difficulties were too many, especially women and children, want of suitable leaders, more competition and experience, too many looking for a soft place.

ISAAC B. RUMFORD.

Studies at Home.

Interesting Facts of the Way to Conduct Them.

We have given from time to time brief statements concerning the "Society to Encourage Studies at Home," and they seem to have been of practical value to our readers, because the secretary of the society assures us that they have received their "fullest assistance in the work in California through the columns of the PACIFIC RURAL PRESS." This is but natural, for we have a community of thoughtful, progressive readers, and many of them by the necessities of agricultural life are isolated, and not able to avail themselves of the opportunities for study at established institutions. Knowing this, we have welcomed the fullest statements of purposes and methods from all societies which aim to facilitate and promote home study.

We have just received from the "Society to Encourage Studies at Home" a copy of the Boston Herald, of recent date, which gives a review of the society and its work. We cannot give space to the full article, but we select the following paragraphs as of most interest and importance:

A society of this kind had been established in England, and by chance one of the reports fell into the hands of Miss Anna Ticknor, who became at once imbued with the spirit of the work. She showed the report to Dr. Samuel Eliot, a man whose enthusiasm in the educational work among the masses is too well known to need comment, and both were instantly inspired with a desire to work out the idea suggested by the title. A correspondence was at once begun with the secretary of the English society, and the details of the work were fully learned, the result being the formation of a society in Boston in 1873. The American society, however, differs in some respects from the English organization. The committee in the beginning consisted of ten persons, and six of its members undertook the entire correspondence with 45 persons, who entered as students during the first term.

The society has just held its 14th annual meeting in Boston. Nineteen of those who joined in the infancy are still active in the work. During the term just ended the society has been busy with 558 students. Of this number 284 are old students and 274 are new, the number of the old and the new being thus nearly equally divided; 191 correspondents have had these 558 students in charge, and thus 749 women have been held together by intellectual bonds of sympathy, though scattered from Maine to Texas, from Bangor to San Francisco. Several of the students represent clubs—28, in fact. Still others have husbands or sisters sharing their studies, and 92 are teachers, whose pupils, it is hoped, profit by the influence which the society exerts. The perseverance represents about 81 per cent of the whole—a very good showing when one considers the difficulties under which much of the work must of necessity be done. Such figures might be associated only with superficial methods and inefficient discipline; but the society claims that such is not the case. Among other proofs of this is the fact that the certificate—which by the way is rarely given—is sought not only at the South and West, but here at home, because the reputation for thorough work which the society enjoys gives it a real value. When a certificate is given it contains a statement of the exact nature and amount of work done, and how well it was done.

One of the questions most often asked by persons interested in the work of the society, and yet ignorant of its extent, is what area of country is covered, and which States give the most students. The answer is ready: Thirty-seven States and one Territory are covered; Massachusetts leads, while New York follows very closely. The group of middle seaboard States, with the District of Columbia, gives a similar number; that is, Massachusetts gives 126, New York, 104; the group referred to, 101. The five New England States come next with 85 students, and keeping still at the North, five States are found, namely, Ohio, Indiana, Illinois, Iowa, and Kansas, furnishing 38; and three others, Wisconsin, Minnesota and Michigan, 28; California, Oregon, Montana, Colorado, and Nebraska give 23, and all the South and Southwest, 48. This does not agree with the impression, which the secretary says some possess here, that the society and its workers are chiefly wanted in lonely western places where population is sparse and resources few. The South is pressing forward—in this as in almost every progressive movement—and comes nearer to the West and Northwest in its claims, but the crowded East still leads the way.

A new experiment this year, in the section of the science course, was the taking up of sanitary science. This was joined in by three persons, one living in Philadelphia, the others in small places in the interior, all of whom corresponded with one lady, a member of the Sanitary Science Club, by which the questions were prepared that formed the basis of the whole scheme.

The library of the society has been increased to 2070 volumes. During the year 1287 volumes have been circulated without the loss of a single one, 305 students have used the books, and 63 associates have used the library in the capacity of teachers. As a proof of the amount of work that has been done, take the following figures: Letters from students to their corre-

spondents count up to 4389; letters from correspondents to students, 4835; letters received by the secretary, 3208; letters sent from headquarters, 2071; printed matter of various kinds, 2628, besides 1080 copies of the Annual Report. The financial condition of the society is good, \$2639.58 having been received during the year, and only \$1834 expended, leaving a comfortable balance in the treasury to begin another year with. It may be as interesting to note

The Various Studies

And the proportion of students to taking them as it was to find the places from which the students came. During the past year the history department, which leads all the rest except that of English literature, had 192 students, of whom more than 70 per cent persevered, nearly one-third taking first rank, a full third second rank, and only a few the lowest rank or no rank at all. Only five were dropped, dropping being the sole form of ignoring which the society knows. The methods in history are very fine and produce good results. A written examination is undergone every month. Many students persistently get 90, 95 and 100 on such examinations—on a scale of 100—and one of these took 100 seven times during the year. Political economy has been added to the history department and is proving very interesting. In the department of science 64 students were entered, of whom five took two sections of the same department. Twenty were excused, and only one was dropped for negligence. Nineteen took botany, 10 took geology, 18 took physical geography, 19 entered the mathematical section, and three, as has been already stated, entered the section of sanitary science.

Fourteen names were entered for the art department, and three of these students took up two art studies; that is, entered two sections. Twenty-three ladies carried on the correspondence, and the industry was great. The mail of this department alone counted up 2000 letters. One hundred and forty-three works, all of recognized value, were read.

How Students are Received.

An inquirer, writing to the secretary, obtains the circular of the society, stating the rules and the subjects in which it offers help, of which there are 30 for selection, included in six departments, with section and subsection, and among these she is to select one only for the beginning. She then pays the required small fee. To the new student two papers are sent, a printed receipt for the money, with which are included these three general questions: How old she is, whether educated at public or private schools, and whether she is a teacher, and a copy of a short letter from the head of the department selected by her, asking other questions appropriate to the subject of the study and giving some directions. These answers to these questions guide the head of the department in her selection of the correspondent. No further direct communication takes place between the secretary and the student, but every month a formal report is received at headquarters from each correspondent, giving certain items for record about each of the students. Meantime the head of the department sends to the new student the name and address of the correspondent to whom she is assigned, with printed directions for the mode of work. The fourth book to be used is, if she desires it, sent from the Lending Library, and she begins to read with the practice of making memory notes, being expected thenceforward to write at the beginning of each month to her special adviser, inclosing a specimen of these memory notes. To this letter she is to receive a prompt reply, and from time to time she will be asked to write an abstract or to answer examination questions, on honor, without referring to books, all for the purpose simply of securing her grasp on the contents of the books she reads, and fixing in her memory the important facts.

The Work on this Coast.

In 1876 an agency of this society was established in San Francisco. Through it time may be saved to students on the Pacific Coast both in the preliminary steps necessary to joining the society and in later correspondence. Further information may be obtained by addressing the secretary for the Pacific Coast, Mrs. E. B. Barker, 14 Stanly place, S. F.

A Remarkable Growth.

The many friends of Messrs. Montgomery Ward & Co., formerly at 227 and 229 Wabash avenue, Chicago, will be glad to know that the rapid growth of their business has forced them to remove from Wabash avenue to 111, 112, 113 and 114 Michigan avenue, where they have purchased a magnificent building, the seven floors of which they will occupy exclusively. These seven floors are each 100x166 feet, aggregating nearly 120,000 square feet (about 3 acres) of floor surface. The new quarters will enable them to handle their large business to the better advantage of their thousands of customers. Fifteen years ago Messrs. Montgomery Ward & Co. occupied but one room, and that only 25x40 feet. The enormous growth of their business during these fifteen years can only be explained by the fact that they sell direct to consumers, supplying all their wants, and never misrepresent any article. The success of this house proves the old saying, that "Honesty is the best policy," and from this policy they never deviate. The Fall Catalogue issued by Messrs. Montgomery Ward & Co. ought to be in every family.

319 and 321
MARKET STREET,
SAN FRANCISCO.

FRANK BROTHERS,

319 and 321
MARKET STREET,
SAN FRANCISCO.

GENERAL AGENTS FOR

THE NEW MODEL GANG,

A Plow fully up to the demands of the times, and SURPASSING ANYTHING in the Plow line EVER BROUGHT OUT, in simplicity and neatness of construction, ease of management, lightness of draft, and adaptability to all kinds and conditions of soil.

It is entirely NEW IN DESIGN, neatly and substantially put together, and operated with a single lever, which raises and lowers the Plow and levels it at all depths. The operator walks beside the Plow, on the unplowed land, or behind in the furrow, as preferred, in easy reach and control of both the Plow and the team.

ITS ADVANTAGES are very apparent to every practical farmer; more and better quality of work can be done, a more uniform depth and width of furrow made, with lightness of draft and ease of management under all conditions of soil. Especially when the ground is hard and dry does it show its superiority to the greatest advantage—sticking to its work and turning a sixteen-inch furrow as deep as may be desired, and with as light, or lighter, draft than any fourteen-inch hand plow. The harder the ground, the greater difference in its favor.

IT IS VERY NEAT and substantial in its construction. The beams and wheels are of steel, and all castings of malleable iron, giving at once lightness with great strength and durability.

The shares are so made that they will cut full width until completely worn out. The team is hitched directly to the beams, close to the work, and, having no tongue, it will plow as close to the fence at the end of the furrow as an ordinary Plow, and is turned as easily as a sulky; in fact, it is so easily operated and controlled that a boy can handle it readily.

Buggies, Buckboards, Harness, Etc., Etc. THE FLINT ROAD CART,

The Finest Finished and Best Proportioned Cart Manufactured.

From the accompanying electrotpe it will be seen that the seat-arms of the Flint Cart rest upon each end of the cross bar and extending to the shafts, are connected by encircling shackles to springs placed beneath them, and working entirely independent of the shafts. This arrangement obviates all horse motion. It prevents galling and chafing the horse. It balances the cart regardless of the different weights of drivers; and the springs working independent of the shafts, relieves both seat-arms and shafts from the strain found in all carts that ATTACH the seat-arms direct to the shafts, and thus fastened, the weight of the driver causes no lateral or vertical motion of the shafts, which ride as easily as a buggy. By this principle, and by attaching the ends of the seat-arms to springs, the driver rides with much greater comfort—never experiencing jolting or violent motion on rough and uneven roads.

Another great improvement will be found in the foot rest, which allows the driver plenty of room and the most comfortable position; at the same time the horse is hitched much nearer the driver than in any other style of cart, which at once recommends itself.

The style of spring, and manner the different attachments are made, does away with all unnecessary material, reducing the weight to from 75 to 90 pounds, while retaining all the strength of a heavier cart.

The attachment of the shafts is perfect. By the use of a patent heel fastener, there can be no possibility of their slipping or loosening, and being clipped to the axle close to the hub, all weight is carried near the end of axle giving the greatest strength.

Shafts, Crossbars, Seat-arms, etc., are of the very best selected SECOND-GROWTH ASH AND HICKORY, and wheels are of the finest quality shell or compressed band. Springs best Swede steel and oil tempered. Leggett's or Sheldon's double collar interchangeable steel axles.

Benicia Patent Angle Iron Harrows.

One Section, with 24 Teeth.....	\$12 00
Two Sections, with 48 Teeth and Draft Bar.....	24 00
Three Sections, with 72 Teeth and Draft Bar.....	36 00
Four Sections, with 96 Teeth and Draft Bar.....	48 00
Two Sections will harrow 9 feet wide; three Sections will harrow 12 feet wide; four Sections will harrow 15 feet wide.	

Possesses many advantages over other Iron Harrows now in the market. The frames made of angle or L-shaped iron of good quality, combining both strength and lightness. The teeth are made on our special order, of peculiar pattern to best secure durability, and, like the frame, made light to insure ease of draft. They are driven through the frames, and then securely fastened by a bolt. The operator is thus enabled to lower them as they wear off, so that they can be kept even at point and utilized nearly the whole length. The Harrow is usually made in three sections—of 24 teeth each—working independently of each other, and adapting themselves to uneven surfaces; pulverizing all the soil alike, though connected, as the cut will show, by hinges and a draft bar.

This Harrow meets the wants of our farmers for an implement that weather cannot affect, that sun and rain cannot injure, that does its work of pulverization of every inch of the soil in the best possible manner, and at the same time is of light draft for the team.

There is no thread cut on end of teeth—to weaken them, nor nuts to lose off, as is the case with other Iron Harrows, but as before stated, all the objections in other patterns have been obviated in the BENICIA PATENT ANGLE IRON HARROW, and it is now pronounced by practical farmers who have tried all kinds, to be the most successful that has been introduced on this Coast, and from its merits alone there has sprung up a large trade and active demand. It is an indispensable implement. It surpasses all other Iron Harrows in every particular, costs less for repairs, while the teeth can be replaced in a moment.

OUR CLAIMS have been, and are daily being substantiated by farmers all over the Coast. Don't make a mistake in ordering, but remember that the BENICIA PATENT ANGLE IRON HARROW with STEEL TEETH, is the BEST, CHEAPEST and LIGHTEST DRAFT MADE.

We make superior Wood Bar Harrows, of all sizes, from thirty to one hundred teeth. The bars are ash or oak, about 2 1/2 x 3 or 3 1/2 inches, with corners and ends neatly rounded. The teeth are from half-inch or five-eighths square steel. A three-eighths carriage bolt is put through the bars close by EVERY tooth, thus preventing any possibility of splitting. The hinges are of what is known as the flexible pattern, and allow each section to have an independent vertical motion of a few inches. They also couple or connect without the use of pins, bolts, or anything of the kind. All of our Harrows are neatly varnished and made in a thorough and workmanlike manner.

The above shows general design of my larger-sized
Stationary Engines. I have patterns for 10x20-inch,
12x20-inch, and 12x24-inch—others under way, and can
generally make prompt deliveries.

THE GOVERNOR is an automatic cut-off, controlling a single slide valve by a direct action on the eccentric, and is connected directly to the valve without any complication of rock shaft, tappets, springs, or dash-pots. A special point, covered by U. S. Patent, is the driving crank or link, connecting the actuating eccentric to the driving disc, so the governing eccentric may be moved about the shaft within the other eccentric (which drives the valve) by the centrifugal and centrifugal action of the weighted arms and springs. The governing force is thus relieved from the strain of moving the valve. I believe this single feature makes this governor superior to any other of its class.

The State Fair.

(Continued from page 244.)

ment form. The success of the Allegratti system clearly appears from the experience at this fair. Early fruits, which were sent from Solano county and from the foothills to West Berkeley for storage a month before the fair opened, then taken out, shipped to Sacramento and exposed to the torrid weather of last week, have shown wonderful durability. Thus, some counties have been able to adorn their exhibits with fruit which is quite out of season and at the same time give a most valuable test to the system of storage.

Ten counties have entered for prizes under the county awards. It is interesting to enumerate them, beginning at the door of the north wing, or Horticultural hall, as it is properly called.

El Dorado county, with a horticultural and agricultural exhibit, supplemented with fine arts and photography showing county scenes.

Sacramento county, with a large space occupied with a most varied collection of products, grains and forage plants, field and garden vegetables in grand display, grape collections of James Rutter and the Natoma vineyard, supplemented by fruit exhibits from a score of growers, domestic triumphs in the shape of jams, jellies, etc., in profusion.

Placer county, filling both wall and table space with fruit in great variety and excellence, minerals of rare beauty and richness, grapes and wine and other articles beyond enumeration.

Nevada county has an exhibit, collected by J. R. Nickerson, a well-known fruit-grower. It is rich in fruit specimens, but hardly less so in mammoth vegetables and in other products of the field.

Humboldt county, as mentioned last week, with its peerless forest products, its instructive photographs and cabinets of minerals and gems—the whole supplemented by such generous field products as red clover, with stems over seven feet high, etc.

Tehama county, also mentioned last week, has now a spread of as grand apples as ever tempted Eve in Paradise; also vegetables and a variety of grain.

Solano county has a display especially rich in the splendid dried fruits of the Vacaville district. Here, too, a fine collection of photographs give the visitor a good general idea of the country.

Yolo county is represented by an exhibit from the Winters district, beautiful dried fruit in great variety.

Yuba and Sutter counties have a joint display, gathered by W. G. Murphy, including both delicious and citrus fruits and most excellent canned goods from the Sutter cannery. To Sutter county also might, perhaps, be credited the splendid individual exhibit of B. N. Bugbey, mentioned last week.

All these displays are in Horticultural hall. Two counties occupy the conservatories (one each) Colusa and San Joaquin, as mentioned last week. Colusa has added greatly to her material during the week, and the exhibit is now quite comprehensive, and excellently set forth.

San Joaquin has her conservatory filled to overflowing with a most excellent and comprehensive display. The place of prominence above the general collection of products is occupied by a triumph of decorative art in the shape of a Houser Combined Harvester, worked in different colored grain heads upon a wire-cloth backing. The form of the machine is faithfully wrought out, and the choice of shades is so art-like that sunshine and shadows are shown. It is the handsomest thing of the kind we ever saw. Such an ornament is well supported by the general tastefulness with which the San Joaquin exhibit is displayed. As for the material shown, it is the most varied in the fair.

The decision of the judges on the county exhibits is looked for with great interest. Governor Waterman has shown his bravery by accepting a place upon the judging committee.

We call it brave for no professional politician would dare to offend nine counties by a single act. But Gov. Waterman will decide honestly and fearlessly, and will, we doubt not, in the end win friends by his courage.

A Graceful Act.

It was a happy thought of the citizens of Sacramento, headed by Mayor Gregory, to tender to all those connected with the county displays a banquet in the name of the city. The affair came off on Monday night, and was a great feast of viands, followed by a great flow of speeches, representatives of each county responding to toasts. Such events tend to teach our people more about each other, and the end is a wider fellow feeling and sympathy.

Other Matters.

There are many other matters which cannot be reached in time for this week's RURAL. The display of agricultural implements and machines has many good points and will be taken up at another time. Other matters too will then receive attention.

Los Angeles Pomological Fair.

The fair in Hazard's pavilion, Los Angeles, under the auspices of the County Pomological Society, was opened Monday evening, Sept. 12th, by the president, Hiram Hamilton, who spoke as follows:

Fellow-Citizens, Ladies and Gentlemen of the Los Angeles County Pomological Society: Since the organization of this society, we have held ten quarterly meetings, in eight different cities and towns of this county, in each of which a handsome exhibit of fresh fruits and flowers has been made, showing the practicability of such an exhibit during each and every month of the year. The moon never waxes and wanes here without the ripening of some fruit. Oranges, lemons, and strawberries mature in the open field every month when skillfully managed. Vegetables grow and ripen continually. Alfalfa yields from six to eight crops per year. The same soil that grows a good crop of barley or wheat during the cooler months, also grows a good crop of corn during the warmer months of the same year, sometimes yielding 140 bushels per acre, often 100. Frosts in Los Angeles county are almost unknown, except in the higher altitudes. The sun never shines upon a land where the rewards of toil are more abundant or sure. The evidences of these facts are now before you, and the Hon. Henry T. Hazard, the proprietor of this pavilion, this magnificent temple of industry, will now welcome you.

Mr. Hazard responded. An address was also made by Gen. W. A. Pile of Monrovia; and Bartlett's 7th Infantry band discoursed fine music.

The building is admirably fitted for a horticultural display; generous table-room had been provided for all sections of the county; all space was taken, and although there was some tardiness about bringing in and placing the exhibits, the middle of the week beheld an output of fruits than which, it was averred, none more complete and attractive has ever been seen in the City of the Angels.

One of the most noticeable exhibits was that of Milton Thomas of Los Angeles. This occupied a table 50 by 12 feet, which was covered with plates to the number of 325 or 350, containing about 150 varieties of apples, pears and peaches.

Among the Alhambra exhibitors, Wm. Stevenson had 13 varieties of apples, two of oranges and two of peaches; G. B. Adams, three varieties of apples, five of oranges and one of pears; F. G. Story, four varieties of figs, two of apples, one of quince, 12 of grapes and two of oranges; W. L. Phillips, 18 varieties of pears, four of pomegranates, six of apples and two of quinces; and Frank Williams, five varieties of peaches, five of grapes, two of pears and two of apples.

S. Rems of Downey showed three varieties of quinces, 25 of pears, two of plums and 36 of apples; and James Stewart, six varieties of grapes, two of figs and eight of apples.

Prominent in Santa Ana's exhibit were the dried figs, prunes and pears of D. Edson Smith, which had been subjected to a fumigating process, after which they were dried in the sun, being turned regularly at 5 o'clock P. M. The rich red color of the French prunes renders them specially attractive. Eastern people could but marvel to see fine specimens of oranges and quinces growing side by side, the branches of the trees intermingling. T. O. Wightman showed samples of eucalyptus 22 inches in circumference, which had attained a height of 43 feet in 24 years, from the seed.

Leonard Parker of Anaheim had on exhibition a watermelon weighing 90 pounds, which took first premium, and he, as well as H. Hamilton of Orange and Wm. Halesworth of Santa Ana, showed cornstalks 17 feet high, bearing ears over a foot in length, which weighed from 5 to 7 pounds each.

The Westminster settlement sent a large and varied collection of products, among which S. Lyman presented six red beets that weighed over 60 pounds each, but five months from the seed; J. T. Anderson, a bundle of small yellow corn that yielded 100 bushels per acre, and a bundle of early amber cane, yielding 300 to 400 gallons of syrup per acre; S. W. Hadley, 17 varieties of apples and two of pears; E. S. House, silver-skin onions, 600 bushels to the acre; Mr. Jefferson, 20 red-eyed potatoes, weighing 32 pounds; Mr. Teel, sample corn, 18½ feet, 4 ears to the stalk, and popcorn with 37 ears to the hill; Josiah McCoy, 16 varieties apples, lemons, quinces, Japanese persimmons and a pumpkin weighing 186 pounds; and J. B. Monlin, scalloped pumpkin, 147 pounds.

Very choice samples of clean, heavy white wheat and of white oats were shown by Herman Johansen and G. D. Reed of Antelope valley.

Gen. J. H. Shields' quaint nests of wild clematis and other vines, filled with delicious peaches from Crescenta Canyada, attracted great attention.

A novelty in the Pasadena exhibit was the fruit of the jujube, shown by E. A. Bonine.

An interesting display of articles made from native woods, found abundantly in the foothills and mountains of the State and claimed to be equally serviceable with lignumvite, was made by J. A. Sanders.

For giving anything like a fair notion of the variety of products shown, we must refer to the list of awards, which we hope to publish in this or a subsequent issue.

The attendance and receipts were rather disappointing, though they increased in the course

of the week; but the society was several hundred dollars out by the exhibition. It would seem that the good people of Los Angeles have become so used to fine fruit that they do not care to pay out money to see even the choicest.

But Friday, when the baby-show came off, there was a grand gathering. Forty-one candidates for premiums were entered, 17 being over one year old and under two years old, and 24 under one year. The prizes ran as high as \$20 in gold coin for single babies, and \$25 for twins. The competition was lively, and the duties of the awarding committee quite arduous, though fascinating.

At the close of the fair all the fruit that was fit for shipment, amounting to a carload, was carefully packed and started for St. Louis, where it is to be displayed during the G. A. R. encampment.

Henry George and the Land.

EDITORS PRESS:—Capitalists and middlemen already absorb a full share of the farmer's earnings. There is, then, no special need that the farmer should pay their taxes in addition to his own.

Some correspondent lately brought to your readers the utterances of many weighty names to indorse George's premises and promises. Authority in political economy seems so evenly balanced that it is not easy to tell how the scale hangs. Moreover, Mr. George founds his doctrines (if I read aright) on the overthrow of all past theories, such respect has he for authority. I profess like respect. To me American and Freethinker are (or should be) terms synonymous.

Put Mr. George's doctrines in their most seductive aspect, and this hard residuum of fact still remains, that the land is to bear the entire burden of taxation. The produce of the land must eventually pay that taxation. Call that cinching the landlord if you will, experience tells me it will be the farmer who will feel the pinch.

I entertain no repugnance to "nationalizing land" so you nationalize brains, nationalize brawn, nationalize capital of all kinds. My own pet creed is all that a man has is for the benefit of his fellows; that, instead of priding himself on the possession of superior powers or possibilities, and using those powers and possibilities for his own exaltation and the further abasement of his inferiors, it should be his pleasure to devote his all to the advancement of the race. "He that is greatest among you let him be your minister."

If Mr. George thinks that happiness and virtue consist in the possession of a half acre of land, with a right to pay taxes thereon to a free and enlightened Government, how does he account for the pinching poverty and sordid misery of the French peasant?

Whatever new-fangled legislation may regulate land tenures, it can never prevent supply and demand ultimately fixing rental or sale values. It is about as clean, simple, and cheap in the long run to pay a big rent to a grasping landlord as to pay a heavy bribe to some tax-eating corruptible. The effects of official meddling with land values in Ireland have not been so happy as to make desirable similar interference in America. EDWARD BERWICK. Carmel Garden, August, 1887.

A Good Old Friend Passed On.

John Taylor of Mount Pleasant, Tuolumne county, whose contributions to the RURAL, both prose and verse, have made him seem like a familiar friend to our readers these many years, has passed from earthly scenes. On the 7th instant a load of wood tipped over upon him and caused his death, but he was alone when the accident befell, and was not found until 10 o'clock that night.

Mr. Taylor was born in Scotland in 1816, and consequently was 71 years of age. He came to California among the pioneers of '49 and located himself about a mile from Chinese Camp, under a tree beside the old Sonora road, on the spot where his hotel was built after ward. Thither came his wife, direct from Scotland, the ensuing year; and there they made their home, kept a house of entertainment for travelers and raised a family of intelligent children. Loved and respected by all who knew them, their amiable manners and just dealings drew around them a large circle of cordial friends.

About two years ago Mrs. Taylor departed this life, and now her venerable husband has followed her, leaving a son and three daughters, to whom, in their bereavement, goes forth a wide and tender sympathy.

"For My Boys."

The widow of a subscriber, who died suddenly in August last leaving her and their eldest son to maintain the family, says, toward the close of a business letter:

Please send the RURAL PRESS right along. We need it more than ever since Mr. J.'s death. It is just the pure, practical reading I wish for my boys. . . . The RURAL is such a good friend that it seems you must be too.

We are very thankful to know that those left in so trying circumstances feel they have in the RURAL and its publishers friends who may be trusted. Hoping and meaning still to deserve such confidence, we extend to the tried ones our cordial sympathy in their brave endeavor. May they be comforted, sustained and victorious.

Inducements to Subscrib

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, to those who pay fully one year in advance of date, if requested the following articles (while this notice continues), at the very greatly reduced figures named at the right:

- 1.—The Agricultural Features of California, by Prof. Hilgard, 138 large pages, illustrated, cloth, with colored maps (full price \$1). \$0.25
- 2.—World's Cyclopedia, 784 pages, 1250 illustrations; (exceedingly valuable) \$0.50
- 3.—Dewey's Patent Elastic Binder (cloth cover), name of this paper stamped in gilt. \$0.50
- 4.—Niles' Stock and Poultry Book for Pacific Coast, pamphlet, 120 pages, illustrated. \$0.25
- 5.—Kendall's Treatise on the Horse and Diseases, 89 pages, instructive illustrations. \$0.05

H. C. SHAW PLOW WORKS, —MANUFACTURERS OF— Reversible and Slip-Share PLOWS.

WRITE FOR PRICES.

HANFORD, August 31, 1887.

H. C. SHAW, Esq.—I used one of your Improved Slip-Share Gangs in a piece of salt grass land, perhaps the toughest in the county, and found that it clung to the soil better and left it in better shape than any plow I ever used, besides running one horse lighter.

C. W. CALLAHAN.

A. M. BELT Assistant Manager

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Park Association, Santa Clara Valley Agricultural Society and Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. The following has a movement of 264 inches, the first revolution of the screw moves the follower 1 1/2 ins., the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track.

Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.

Printed Testimonials can be had on application of the following parties, who have bought my press: J. B. J. Portal, San Jose; Wm. Pfeiffer, Guberville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. Stiller, Guberville; Lay Clark & Co., Santa Rosa; Vache Freres, Old San Bernardino; J. F. Crank, San Gabriel; James Finlayson, Healdsburg; P. & J. J. Gobbi, Healdsburg; Wm. Allen, San Gabriel; Wm. Metzger, Santa Rosa; J. Lawrence Watson, Glen Ellen; Walter Phillips, Santa Rosa; Geo. West, Stockton; Eli T. Shepard, Glen Ellen; Rancheto Wine Co., Rancheto, Los Angeles Co.; Downing Fruit & Wine Co., Downey; J. L. Beard, Centerville; Wm. Palmatier, Hollister; A. Burnham & Son, Santa Rosa; Paul O. Burns Wine Co., San Jose; E. Emil Meyer, Santa Cruz Mountains, Wright P. O.; Marshall & Hill, Laguna Station; R. J. Northam, Anaheim.

A Treatise on the Horse and his Diseases
By B. J. KENDALL, M. D.

35 Fine Engravings showing the positions and actions of sick horses. Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines. Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year. It is printed on fine paper and has nearly 100 pages, 7x5 inches. Price, only 25 cents, or five for \$1, on receipt of which we will send by mail to any address.

EXPLANATION.—Cl. for clear; Cy. cloudy; Fr. fair; Fy. foggy; — indicates too small to measure. Temperature. Wind and weather at 12:30 m. (Pacific Standard time), with amount of rainfall in the preceding 24 hours. T indicates trace of rainfall.

AGRICULTURAL BOOKS.

Sold by Dewey & Co., Publishers "Pacific Rural Press."

CALIFORNIA FRUIT GROWER.—A practical Handbook for the orchardist (in preparation).
 CATALOGUE OF EUROPEAN VINES.—With synonyms and brief descriptions, by I. Bleasdale, D. D. Invaluable to those growing the vinifera. Price, in pamphlet, 50 cents.
 ORANGE GROWING IN CALIFORNIA.—By T. A. Garey, of Los Angeles. The most comprehensive treatise on the growth of this fruit. It contains full instructions for growing the trees, planting and care of orchards, etc.; 227 pages. Price, 75 cents.
 SILK GROWERS' MANUAL.—By W. B. Ewer, A. M. A practical treatise full of useful hints for beginners in this State; 20 pages. Pamphlet, price 25 cents.
 FRUIT GROWERS' CONVENTION REPORTS.—These annual conventions have resulted in bringing out the best and most useful information concerning the growth of different fruits in this State. The subjects discussed are of the most direct practical value and the facts laid down will prove helpful and suggestive to all in the fruit business. We have the reports of 1881, 1882, 1884, and 1885—the first for 10 cents, the others at 25 cents each.

THE AGRICULTURAL FEATURES OF CALIFORNIA.—By Prof. Hilgard, 138 large pages, bound in stiff cloth, with colored maps, \$1. This book is the best general review of California soils, climate and productions in existence.
 NILES' STOCK AND POULTRY BOOK.—Pamphlet, giving directions applicable to poultry growing in this State; 120 pages, post-paid for 50 cents.
 KENDALL'S TREATISE ON THE HORSE AND DISEASES.—Post-paid for 25 cents.

ARCHITECTURE SIMPLIFIED OR HOW TO BUILD A HOUSE.—Contains plans and amounts of materials for a number of buildings from a little cottage to a large dwelling. Price, five cents.
 Fruit Evaporators.
 The following is one of many testimonials received by the undersigned regarding the Zimmerman Fruit Evaporator:
 "I have used one of your (No. 4) Evaporators and find it to be all that is claimed for it. In my judgment it is very economical in the use of fuel, and I am satisfied that it exacts no greater care or more work than any other Evaporator I have seen, and I think it does the work as well, and at less cost than any I have seen. I therefore cheerfully recommend the Zimmerman to all who are in need of such a machine."
 "THEO. WAGNER."
 "Oak View Ranch, Contra Costa Co., Aug. 17, 1887."
 Send for descriptive pamphlet to James Linforth, 120 Front St., San Francisco.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.
 BACK FILES of the PACIFIC RURAL PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

EVERY FARMER THE BEST IS THE CHEAPEST HIS OWN MILLER

WE HAVE HAD 32 years Experience.
 Use the Halladay Standard Geared Wind Mill, I-X-L Corn Sheller and I-X-L Iron Feed Mill and do your shelling and grinding at home, thus saving toll and teaming to and from the Grist Mill. This work can be done rainy, windy days, when outdoor work is suspended on the farm. The same Mill will cut corn stalks, saw wood, run churn and grind-stone, pump water, etc.
 We manufacture the Halladay Standard Geared and Pumping Wind Mills, I-X-L Corn Shellers, I-X-L Iron Feed Mills, I-X-L Stalk Cutters, Horse Powers, Jacks, Saw Tables, Standard Hayrack Tools, consisting of Anti-Friction, Reversible, Swivel and Rod Hay Carriers, Harpoon and Grapple Horse Hay Forks, Pullers and Floor Hooks. Also a full line of Tanks, Tank Fixtures and Pumps for Farm, Ornamental, Village and Railway purposes. Send for catalogue and prices.
 Reliable Agents wanted in all unassigned territory.
 U. S. WIND ENGINE & PUMP CO., Batavia, Ill.

"Walnut Grove"

Registered and POLAND-CHINA HERD Thoroughbred.

My herd consists of the best strains that can be found. Stock all recorded in A. P. C. R. I have a fine lot of spring, summer and fall pigs, also a few choice yearling sows, for sale. Prices to suit the times.
 J. MELVIN, Davisville, Cal.

Dewey & Co.'s Scientific Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Catalogue sent on application. Address, JAPANESE TREE IMPORTING CO., Room 72, 120 Sutter Street, San Francisco, Cal.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. KORME—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid	12.90 per cent
Reverted Phosphoric Acid	.95 "
Insoluble Phosphoric Acid	2.83 "
Potash	2.43 "
Ammonia	1.87 "
Nitric Acid	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,

DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

Dr. J. KORME, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1/2 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

DR. PIERCE'S New Galvanic Chain Belt with Electric Suspensory, is guaranteed the most powerful, durable and perfect Chain Belt in the world. It positively cures, without medicine, Nervous Debility, Pain in the Back, Kidney Disease, Rheumatism, Dyspepsia, Weakness of the Sexual Organs, etc. For full particulars in Pamphlet No. 2. Call or write for it. Address, MAGNETIC ELASTIC TRUSS CO., 704 Sacramento St., San Francisco, Cal; 304 North Sixth St., St. Louis, Mo.

ZIMMERMAN Fruit Evaporator.

Read Some of the Testimonials.

I have found the Machine (No. 3) very simple, and it does the work to perfection. Parties who have larger Driers of different makes say they cannot turn out superior fruit (apricots and peaches) to mine.
Vacaville, June 12, 1887. I. W. A. GILMORE.

I found the Machine (No. 2) good, and can truly subscribe to all the merits claimed for it. I have sent apples to Santa Rosa and they sold as first-class.
Laguna, July 15, 1887. W. H. J. AITKEN.

Evaporator came safe to hand (No. 3). Have tried apricots with good success.
Stockton Nursery, July 15, 1887. E. C. CLEWES.

Before writing I wanted to test the Drier also on peaches, apples and pears. Am now doing so with the very best results. Upon the whole, I am greatly pleased with the Drier.
(Rev. Dr.) W. ALEXANDER.
Batavia, July 29, 1887.

I am doing fine work with the Drier (No. 3). I bought it in company with Mr. A. J. Lay, and he, after trying it, takes it all. You can refer to me and I will try to sell more.
C. C. MARTIN.
Glenwood, August 5, 1887.

I have been using a Zimmerman (No. 3) Evaporator on my apricots this season, and cheerfully attest the fact that its performance is fully up to its promise. Its simplicity is such that, although novices, we have succeeded in turning out admirable work, and its economy and facility are quite remarkable.
JAS PALACHE,
August 9, 1887. (Of Kittle & Co., S. F.)

HORTON & KENNEDY'S FAMOUS ENTERPRISE WINDMILL

Is recognized as
THE BEST.

Always gives satisfaction. SIMPLE STRONG and DURABLE in all parts. Solid Wrought-iron Crank Shaft with DOUBLE BEARINGS for the Crank to work in, all turned and run in adjustable babbit boxes.

Positively Self-Regulating.

With no one springs, or springs of any kind. No little rods, joints, levers, or anything of the kind to get out of order, as such things do. Mills in use 6 to 12 years in good order now, that have never cost one cent for repairs. All genuine Enterprise Mills for the Pacific Coast trade come only through this agency, and none, whether of the old or latest pattern, are genuine except those bearing the "Enterprise Co." stamp. Look out for this, as inferior mills are being offered with testimonials applied to them which were given for ours. Prices to suit the times. Full particulars free. Best Pumps, Feed Mills, etc., kept in stock. Address,

HORTON & KENNEDY.

ALWAYS

Victorious

—THE—

HOUSER

Combined

HARVESTER

AHEAD!

BOTH THE

Large and Small

HOUSER

Achieved

—A—

VICTORY

OVER ALL

Competitors.

THEIR SUPERIORITY HAS AGAIN BEEN PROVEN BY FIELD TRIALS.

400 IN FIELD USE IN 1887 AND NO FAILURES!

The past harvest season again demonstrated the fact that for all conditions of grain, light or heavy, standing or down, clean or weedy, the Houser was equal to every emergency and retained its supremacy, which it has held for 10 years past. There is no grain too heavy, weedy, or badly lodged for the Houser to handle.

THE EXTRA CLEANER

As Improved for the season of 1888 and thoroughly tested in 1887, did better work than any other cleaner in use. It excels all others used on Combined Harvesters. The Houser has 30-inch Cylinder, 42x46-inch Separator, Steel, Shafting and Gearing and Double-Strap Brake; wide Header Draper, high, wide drive-wheels, and tire from 12 to 24 inches wide as ordered; has harvested grain which yielded 70 bushels per acre, and cut, thrashed, cleaned and sacked ready for market, from 200 to 500 sacks per day, in a good and satisfactory manner. It is so constructed that an Elevator to run the straw into Header Wagons can be attached, or a Dump, leaving the straw in small piles, or Dump Cart with Elevator, leaving it in large piles.

BOTH THE LARGE AND SMALL HOUSER WILL BE ON EXHIBITION AT THE STATE FAIR, SACRAMENTO, AND DISTRICT FAIR AT STOCKTON.

Send for Circulars. Correspondence solicited. For further information, prices, etc., address S. C. H. & A. W., Box M, Stockton, Cal., or

Stockton Combined Harvester & Agricultural Works, Stockton, San Joaquin Co., Cal.

SMALL HOUSER.

To meet the demand for a Smaller, Lighter Harvester with narrower cut, adapted for Small Farms and Rolling Foothill land, and which can be run with three men and from 12 to 14 animals, we constructed a

LIGHT 10-FOOT CUT HOUSER HARVESTER.

IN WEIGHT $\frac{1}{2}$ OF THE LARGE HOUSER.

A Pull and Belt Machine, strong and easily handled. The Header part is rigid, but can be readily detached.

HAS OUR IMPROVED 36-INCH DOUBLE SHOE CLEANER,

12-inch Cylinder Pulley; 33x8-inch front Lead Wheel Separator 37 inches and Cylinder 27 inches. It was given a thorough test in different conditions of soil and grain; cutting from 18 to 25 acres per day with 12 animals on hard lands, and gave satisfactory results in every respect.

Will Build Them to Order From 10 to 12 Feet Cut.

It is the machine for thousands of Farmers in this State.

As the Large Houser is the Leading Harvester for large grain fields, so will the Small Houser prove for small fields.

Reminiscences of the Spanish Merinos.

[Written for the RURAL PRESS by SOLOMON W. JEWETT.]

I esteem it not only a privilege but a real pleasure to call to memory experiences of the past, and to introduce to you the portrait of a venerable, worthy and honored citizen of France, and present a brief outline to the reader of the PRESS of Mons. Gilbert, the successful propagator of the Spanish variety of sheep in France, and the pioneer in the improvement on the "Paular" variety which are being bred to-day with great profit and success on the Atlantic and Pacific Coasts of America and in Australia.

Firstly, let us go back 100 years to the shepherds of Spain, noted for their perfected culture of merinos quite free from defect, producing an abundance of fine, oily, soft, curly, crimped wool, subject to felt and full, which none of the mutton or hairy breeds ever did possess. It was there in Spain that this variety was brought to a state of great perfection from very unwilling circumstances. We have never learned of more than five families in Spain where special attention was paid to breeding. It was at the haciendas of these noblemen that these superior flocks were bred. They numbered several thousand, and each grower's animals differed in some respects.

Consul Jarvis, in 1816, purchased and imported into North America a considerable number drawn from these fine flocks on the Spanish peninsula, and he gave preference, on trial, to the "Paulars," which were distinctly marked by heavy dewlaps and loose folds and flat tails at the setting on at the body, because they were hardy, a size larger than the others and produced more wool of good quality and more oil, which is essential in producing a most soft and elastic feeling in the broadcloths manufactured therefrom. Wool is of a horny substance, and the oil mellows down the more harsh feeling of the fiber, which is so prevalent and perceptible in the more coarse and hairy wools that are quite free from this unctuous substance.

The *Cultivator*, by Luther Tucker & Son, had an elaborate letter in print from Consul Jarvis of Vermont as early as 1845, and another account may be found in the same journal about 1854, giving a long detailed history of the merinos in France. It was presented to me in print by the successor to Jean Baptiste, the son of Victor Gilbert, with whom I became acquainted in April, 1851. I secured all he had on sale of ewes that season, and by a continued contract, all he could spare the three following years suitable for breeding purposes among the ewes, at 200 francs each.

The only two other private flocks of note in France also contracted all their surplus of breeding ewes on the same conditions, and the stock thus secured was sent in 23 shipments, mostly sheep, and cost to import into Vermont over \$65,000.

Under Daniel Webster, Secretary of State, I went out as bearer of dispatches from this Government to the Court of St. James and Paris, France. I was provided with a free traveling passport, and thereby secured advantages that the private citizen, without friendly acquaintance, could not expect on the continent of Europe. Besides this I had the appointment from the Governor of Vermont as commissioner to the World's Exposition and Fair at Crystal Palace, Hyde Park, London.

And now I will speak of the subject of this sketch, which is fairly represented in the portraits of man and animal on this page. They were engraved from Victor's picture that ornamented the walls of his parlor at Seine-et-Oise. Jean Baptiste Frances left the farm and his personal property to his son Victor Gilbert to continue on after his death, which occurred in 1849, at the age of 91 years.

It was 101 years ago that the Government of Spain allowed a selection of merinos to cross their boundary lines into France—generously presenting these fine animals to the King of

shipper the sum of \$8500. Three other more extensive shipments were made overland of the best improved merino selections in Addison county, Vermont, to Kern county, where my sons reside, and where they have been successful in conducting their sheep interest. They have reared and sold many thousands for breeding, and are still known and rank high among the fine-stock growers of this State as breeders of sheep, cattle and horses, as many of the leading stock-growers in the States and Territories this side of the Rocky mountains can testify.

From close observation and travel in the Old

JEAN B. F. GILBERT, PIONEER PROPAGATOR OF FRENCH MERINOS.

France. The flock on its arrival was divided—one-half settled at Rambouillet, which is, and always has been, under the French Government's attention and control; the other half were bred and kept by a private farmer (a friend to the King) until his death, when all or most of the flock went into the hands of M. Gilbert at his high walled-in farm of 300 acres near Gregnot, three miles out from Versailles. The Gilberts have been awarded the distinction, to which they are entitled, of being the original founders of the improvements on the Spanish stock originally presented, and especially the continuation of the well-defined marks of the Paular variety, which are so much sought after and bred in our country all over.

It was my good fortune to introduce into California many pure descendants of the stock from France, and 17 rams from the "Atwood" race of merinos. The first came in three shipments over the Vanderbilt line of steamers into San Francisco, commencing in 1859 and up to 1862. The bill of importations cost the

World as well as the new, I find a decided improvement has been secured upon the French, the Spanish and American merinos within the last generation in size and form. The production of wool has also materially increased over the amounts formerly secured in Spain.

QUEER OREGON PRODUCTS.—It is telegraphed from Portland that rather a queer export trade to San Francisco is likely to reach considerable proportions. One dealer was packing 200 dozen crawfish for shipment by steamer. They were caught in the Willamette river, and a dozen good-sized ones weighed three pounds. It was intended that they should reach San Francisco alive. A Frenchman brought into Portland 500 head of fine snails. He sold them at once at a high figure and took orders for several thousand more. He found them on the mountain, some distance from Portland. Frogs are captured in large numbers in the sloughs along the river, and considerable numbers are shipped to San Francisco.

Firing the Forests and Its Penalty.

In addition to what was said in our last issue on the subject of forest fires, it may be well to state that we have in California a law making the starting of such fires under certain conditions a penal offense. By the provisions of this law any person willfully setting fire to any wooded country or forest belonging to the State or to the Federal Government, or to any place where fire would communicate to such forest, is subject to a fine of not more than \$1000, or to a term of imprisonment for not more than one year, at the option of the court. From the foregoing it will be seen that a person starting a fire on his own premises, if he suffer it through remissness to extend to forests on the public domain, is liable under the provisions of this Act.

In many other States of the Union similar laws have been enacted, though in none perhaps is the necessity for them so great as in California, the dry season here being longer and suffering less interruption than is the case in any other part of the country.

Since our last issue we observe that a number of field and forest fires have occurred in different parts of the State, some unavoidable, but more, no doubt, the result of carelessness or design. If in any such cases the starters of these fires have made themselves amenable to the provisions of our State law, they ought to be enforced against them. That they will be more rigorously enforced hereafter may be expected, as the public mind has been much stirred up of late to the enormity of these offenses.

Where it can be shown that a fire of this kind has originated from a campfire left burning or from a lighted match, cigar stump or the like thrown into the dry leaves or grass, the offender would be liable to arrest, as the courts would no doubt hold that such carelessness amounted to a willful violation of the law.

No Compromise With Slickens.

A dispatch from Marysville to the Cal. Associated Press states that at a regular meeting of the Advisory Committee of the Anti-Debris Association last Monday, a hearing was given to Senator Stewart of Nevada on behalf of his clients, the Sierra, Union and Pioneer hydraulic mining companies, in Sierra county, whose mines are and have been for a long time under an injunction in the anti-debris suits. After considerable discussion, a resolution was passed denying the request of Senator Stewart that his clients be permitted to continue hydraulic mining upon condition of their building debris dams.

It may be accepted as a fact that public sentiment is opposed to anything of a nature to compromise the anti-debris fight, and the people of Marysville and the surrounding country feel that no restraining dams that could be constructed would protect the rivers from filling with slickens, since enough light material would be carried in suspension over the dams to cause injury.

AGRICULTURAL DIRECTORS.—Gov. Waterman has appointed M. J. Donahue, W. H. McKenzie, W. Helm, W. H. Hughes of Fresno, J. T. McSwain, S. C. Bates, L. Leach of Merced, J. M. Corcoran of Mariposa, directors of Agricultural District No. 21.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Green Valley Notes.

EDITORS PRESS:—The boom long-looked-for come at last! We all knew the millennium was coming, yet there was also a rumor in the air that the boom was on the way; and it seems the boom was the most interesting visitor, at least for the last six months or so; the first question always was, "How is the boom; has it got here yet?"

At last we clubbed together and placed an advertisement in the leading papers to the effect that we had lost an empty sack with a boom in it, black-and-tan, with a bobtail, and answered to the name of "Boom." And here it is. We will never forget that Sonoma county's boom began with the sale of a Green valley hop and fruit farm, for the price of \$38,000. And then the news that the railroad from Santa Rosa, Carquinez, and all the way overland to Chicago and New York would surely be built, has fairly let the boom loose in the county. The best sale we have heard of in this valley as yet is of a place that was sold at the rate of \$300 an acre.

But there is a boom here which we think more of and which we believe will have a better and more lasting effect than any profit, no matter how great, a few speculators may make on the purchase and sale of a few city lots, and it is that people here are satisfied with their circumstances and are not anxious to leave. The truth of the matter is, that to begin with, we have raised a good crop of good, clean hay, and, notwithstanding the large amount of hay carried over from last year's crop, hay sold at a fair price; then we have had a large crop of fruit, and it was good fruit, and it sold for a good price. The Santa Rosa Packing Co. paid \$30 per ton for peaches, and nearly all the peaches put up came from this valley; but it soon became evident that one canner could not use up the smallest half of our peaches, and people began to blame themselves for not having been more previous in engaging their fruit, but they had to do the next best thing, and so they built themselves evaporators, and others bought lumber and shakes so as to let old Sol take care of their peaches. When the Crawfords were ripe we had some 35 or 40 evaporators at work, employing from 2 or 3 to 15 or 20 hands each.

We remember one of our farmers who had his crop of about 40 tons engaged to the cannery, and he complained that the hired help had been so careless in picking that in going over the trees at different times, they would only pick the ripe ones within easy reach and leave the others to get overripe, so that he had to dry them, and now he can get more for his dried peaches than he got for the ones he took to the cannery.

There is not a farm in this neighborhood, with no matter how dilapidated a little family orchard, where the owner has not sold \$50 or \$100 worth of fruit, and many will run their accounts up into the thousands. Just now the last clings are going to the cannery, and it is a poor peach indeed that does not bring two cents per pound. The driers are paying from \$8 to \$14 per ton for apples, and apples are a good crop this year.

Potatoes are a fairly good crop and prices no worse than other years. Thrashing was only just commenced when the price of wheat came down, so that producers will have to take \$1.25 for their wheat, which makes them feel rather sad. There is rather more wheat here than ever before, and, what is better still, it was raised on less ground. Most of the wheat sown here of late years is put in on soil that was planted to corn or potatoes the year before, and the result is a better crop of better wheat.

At present everybody is picking hops, and so are their sisters and their cousins and their Chinese. Hops are plenty and help scarce, and that brings us back to the boom again.

Boom Philosophy.

Nothing helps the good feeling in a place so much as does the workingman's happiness. There can be no boom—at least no genuine progress—when the wageworker is grumbling and complaining of hard times, but give him plenty of work at good wages and he is a brick; that is to say, like the last brick in a row of bricks, set up a few inches apart and up on end. Give him a push and he pushes his neighbor, and so on till they are all down. And so with us human bricks. We have had hard times here a year or two ago, and people tried to live within their means, and the first move was to discharge the hired man if he did not work at something which brought back the money invested. Then slowly, wages being low, men with brains and capital saw a chance to make some money producing or manufacturing one thing or another; they succeeded, others followed suit, wages went up, and now it is boom!

Boom for the workingman, boom for the saloon-keeper who sells him whisky. Boom for the dry goods merchant who sells him and the whiskyman clothes. Boom for the shoeman, and the furnitureman, and the doctorman, and the lawyerman, and even a little boom for the farmer who keeps them all in grub.

And the farmer buys some machinery and a

wagon and some fruit trees on tick because it is boom, and the lawyer and the doctor get a new house on the installment plan, and the merchant gets a large stock of goods on the 90-day plan, and the workingman spends the money on Monday which he will not earn before next Saturday, and it is boom all around, and capitalists loan money on real estate, and nobody pays interest or principal, for is it not boom now? And we have not borrowed half as much on our ranches or factories or stores as we can get, but in a year or two or three somebody will want what is due him, and everybody can show value for what he owes except the workingman, and he is only a week or so behind, and consequently don't buy any whisky for a week or two, and that tips over the first brick, and there they go, and the farmer's brick is the last one in the row.

There is a general opinion that the farmer's brick does not drop as flat as the other bricks. This is a mistake, as all the other bricks are on top of it; the farmer's brick is the last one to get up and is only up on its side when the row comes down again. But never mind, in the year of our Lord 1892 it will be boom again.

IRREGULAR CORRESPONDENT.

Green Valley, Sonoma Co.

"Poor Florida!"

EDITORS PRESS:—For many years I have read the RURAL PRESS with great interest and high appreciation of its many meritorious and sterling qualities that make it emphatically the paper of the people, especially of those who reside or those interested in the welfare and progress of your magnificent golden and fruit-growing State. There are few, I wot, of the citizens of our great and glorious Union who do not feel great interest and pride in California's magnificent resources and wonderfully rapid, and, I trust, substantial development.

In the RURAL PRESS I have ever found the articles fair and candid, full, it is true, of fervid descriptions of California's varied scenery, climate and productions, sometimes apparently drawn almost to the border land of exaggeration by the strong enthusiasm of the writers, but nevertheless free from disparaging allusions to other sections and making few invidious distinctions.

In the issue of August 20th, the anniversary of my natal day, however, I find an article entitled "Poor Florida," that shows an animus entirely foreign to anything I have heretofore seen in the PRESS. It is clothed in the garb of pretentious, aye, of vindictive sympathy, freely strewn with the crocodile tears of jealousy exultant in the hoped-for downfall of a very formidable and attractive rival.

The evident animus of the article referred to is unworthy the RURAL PRESS and its magnificent record. Though very mild in its bitterness, as compared with articles by far too frequent in some other California papers, who do not hesitate to spread broadcast the most baseless, reckless, venomous and atrocious fabrications regarding this peninsular State, the "Land of Flowers," the home of the orange and a great variety of other semi-tropical fruits, and most things that can be grown in the temperate zones, it nevertheless makes apparent how exceedingly bitter must be the feeling of California as regards Florida when even the RURAL PRESS, a paper so eminently noted for its spirit of fairness and justice, permits itself to indulge in such a bitter and deleterious expression of sympathy.

Unjust and depreciative rivalry of sections is to be deplored, as it is injurious both to the defamer and the defamed. No good can come of it; no permanent benefit is ever secured by unjust, indiscriminate and reckless depreciation even of a rival, of an adversary. But California and Florida have no occasion to be either. Until the recent past there has been in Florida no feeling of antagonism toward the "Golden State." Our people have rejoiced in your prosperity; in your grand and glorious development. They were glad to know of it, and most sincerely hoped it might continue. They felt proud of your magnificent achievements and were not disposed to put a single obstacle in your way. The recent course of a portion of the press of your State has been so very, so bitterly unfair and unjust, that a different feeling is materializing here.

California and Florida are not naturally antagonistic and there is no sound or creditable reason why jealous or designing people should make them so. Each has its own magnificent destiny to work out, and their progress will not be accelerated by unjust accusations or defamation of each other. "Let us have peace," friendly emulation if you please, but be forever done with this jealous, bitter, unjust, self-destructive crimination and recrimination. Each State possesses some advantages, some attractions, not possessed by the other. Each has its excellencies; each has its drawbacks and defects. No one section or country possesses all the good and desirable things.

The "bereavements and afflictions" of Florida have not been as great as those common to most other States. True, the loss of a considerable portion of the orange crop by the freeze of January, 1886, was sorely felt by many of the inhabitants, but the losses were nowhere as serious as the frequent losses of other States by droughts, floods or insect ravages that occur every few years. Besides, it was the first destructive freeze for 50 years. California, I be-

lieve, has had fully as many bad freezes as Florida, if not more.

Besides growing oranges, Florida has a number of other great industries that return large incomes. It is a great corn-growing State. It raises immense quantities of long staple cotton. The growth of tobacco is found to be very profitable. It has immense herds of cattle that have proved very remunerative. Its fisheries employ many men and yield large revenues. Large quantities of sugar and syrup are made in Florida. The growing of early vegetables and of a great variety of small fruits are very extensive and rapidly-developing industries. The soil and climate are found to be peculiarly well adapted to the profitable growth of grapes and vineyards are being established. There are numerous other industries that annually yield large revenues and all are prosperously developing from year to year. The question is not what can be profitably produced in Florida? but what, if any, of the articles common to the temperate or semi-tropic zones cannot be produced here successfully?

As regards the winter-boarder business said to be lost, it is increasing from year to year; but the facilities of transportation have been so greatly enlarged by the building of new lines of railroad, while the number and quality of the hotels has so greatly increased all over the State, that they are no longer confined to a few localities after their arrival here, as was the case a few years since.

The answer to the report of the agricultural spy of the Italian Government, with regard to the fitness of Florida soil for the growth of oranges, is sufficiently discredited by the vigorous growth of the orange trees, the superior quality of the fruit itself and its rapidly increasing quantity, year by year. These facts prove the utter absurdity of the report.

As regards the quoted statement of the N. Y. Sun, that it knows none who have invested money in Florida orange groves and become rich, it is only one of the accumulating evidences that the N. Y. Sun knows very little. It claims a light that "shines for all," but it is a very dim and uncertain light—a deceptive light. Its prejudices make it cross-eyed. It knows very little about Florida, and it prefers a lie to the truth. I know, and thousands know, many men who have acquired and are acquiring wealth from Florida orange groves.

Your closing paragraph, "Again we are disposed to exclaim: Poor Florida. Pine on your barrens. Lock your doors and sink your keys in the gulf," is certainly an eye-opener as to the quality of the sympathy expressed at the beginning of the article. But Florida desires no sympathy, asks for no sympathy, needs no sympathy. Florida is prosperous and happy. Florida is not disposed to pine or repine, and has few or no barrens. She has no wish for a speculative boom, a craze in prices. She seeks substantial development, and it is increasing year by year. Her soil on the average throughout the State will produce more cash value per acre than any other State in the Union, without exception. Florida has "the keys" to a magnificent development, and she is using them to unlock new treasures from year to year. She is destined to become the grandest, the most populous and the most wealthy State, acre for acre, of any State in America.

"Lock the doors and sink the keys!" Oh, no! Florida is opening wide her doors to the industrious and to the intelligent, to the rich and to the poor who desire to become wealthy, to all who desire healthful, happy homes surrounded by a semi-tropical luxuriance of all desirable productions, in a climate delightful in both summer and winter, a land where every season is joyous and productive of the choicest delights this world affords. No other State was ever able to secure a class of people like those who are pouring into Florida by thousands. They are intelligent, energetic, industrious, orderly, God-fearing people, the very *creme de la creme* of the best classes at the North and West, the Middle and Central States, and the South, as well as many from beyond the seas. With a steady and rapid infusion of such blood poured into Florida by many streams, and in augmenting quantities, is it any wonder that her fast-increasing population begin to feel within their veins the pulsations of the grand and sublime destiny that awaits Florida in the near future, and that will place upon her imperial brow not only the victor's crowns of laurel, of oak and of bay, but also the brightest, the most sparkling, the richest diadem that the genius of the age can produce? Nature and art, wealth and culture will here unitedly labor to create the grandest achievements possible to the human race.

Please publish the foregoing as a matter of justice to Florida. SHEERMAN ADAMS.

Gabriella, Orange Co., Fla., Sept. 2, 1887.

[Our correspondent is an old acquaintance for whose statements we have much respect. We have always intended to do the fair thing by Florida. The paragraph to which he takes exception was not intended as a slur at the State. It seems to us that the very style of expression adopted in writing it would show that the reflection was against the parties circulating such reports and not against the State.

The style was mock sympathy, of course—mock sympathy because real sympathy was not called for. If we had understood that the criticisms were true and that sympathy was needed,

we should have written about it seriously. As it was, the paragraph was intended to be a piece of good-natured railery. So far as we know, Florida is doing well, and certainly there should be the fullest cordiality and mutual well-wishing between the two summer-lands of our country, as our correspondent so well depicts.—EDS. PRESS.]

THE VETERINARIAN.

Equine Cerebro-Spinal Meningitis.

EDITORS PRESS:—In a late issue of the New York Weekly Herald there is a long account of a disease affecting horses in New Jersey. Reviewing the evidence of the expert witnesses, there is no doubt whatever that the trouble is due to an inflammation of the brain and meninges of the spinal cord—cerebro-spinal meningitis. This interesting ailment exists as an epidemic. (A few years ago the horses of the railway stables of London were the subjects of it.) Dr. Liantard, a well-known veterinary surgeon in New York, being called to attend some of the sick horses in Jersey City, he pronounced them suffering from cerebro-spinal meningitis. The subsequent post-mortems showed that he was perfectly right. "They all died very rapidly, and when an autopsy was made it was found that the coverings of the spinal column were inflamed, and that the spinal column itself was softening. The brain, too, was considerably inflamed."

The symptoms are loss of appetite, unnatural movements of the head, partial or complete paralysis, the main parts affected being the hind quarters and the throat, a rapid rise in temperature, and in a short time, a complete loss of power. Some horses—those of a nervous temperament—become very violent when attacked, but others remain very quiet. Some, again, die within 24 hours, while others linger for a few days. As to the origin of the disease, like all other ailments due to specific germs, like produces like, and wherever the germs or seeds of cerebro-spinal meningitis exist there will be this disease produced.

At last accounts there seemed to be no cases in Long Island City, as "the reporter went to Mayor Gleason's office and asked him if a gift-enterprise sheet of this city was correct in saying that there were reported to be two cases of cerebro-spinal meningitis in his stables. The mayor laughed heartily and said that not one of his horses was sick and that the veterinary surgeon who has charge of them had examined them that very day."

Although the account and evidence of the veterinarians in the above-mentioned paper may seem to those not acquainted with professional matters to differ materially, yet such is not really the case; their opinions and statements are essentially alike. And perhaps I may be excused if I digress from the subject for one moment, to say that the proverb "Doctors differ" is, like many other popular sayings, not always correct.

Treatment. At the risk of being thought wearisome, by so often stating that sanitary and preventive measures should be adopted, I must repeat that all we can do in this disease is to separate the healthy from the afflicted animals, remedy any defective health-arrangements, and of course do what we can to alleviate the sufferings of the diseased, but not with the hope of rendering them again serviceable animals. I allude to the worst cases, as there are a few horses which may be successfully treated. But when the brain and spinal cord are affected, as were some of those cases of Dr. Liantard's, it must be plain to any one that treatment would be useless. The nervous system being the part affected, all noise and excitement should be avoided. And where medicine is necessary it should be administered in such a way as not to frighten the patient. Hypodermic injections and powders placed upon the tongue are preferable to the ordinary method of ball and drench giving. Above all things, do not allow meddlesome people to continually annoy the poor suffering horse by giving their "cure-alls." Let the food be soft and succulent—bran mash, oatmeal gruel, and such food as he can easily swallow. If the patient is so weak as to be unable to turn himself, you may much relieve his suffering by moving him to the other side, as if he lies too long upon one side of the body, bed-sores give much trouble; and these occur very soon, in the case of horses, because they toss themselves to and fro. Light seems to trouble them; consequently it is good policy to darken the stable.

ROBERT J. DAWSON,
Veterinary Surgeon.

225 Geary street, S. F., Sept. 17, 1887.

GLASS COACHES, or coaches with panels instead of curtains at the sides, do not appear to have been introduced in England until the middle of the 17th century. Plate glass for the purpose was of Venetian origin.

COAL IN THE NORTHWEST.—A member of the Geological Survey, engaged in investigating the coal deposit in the Saskatchewan region, states that the coal supply in the Northwest is absolutely inexhaustible.

THE ORNITHOLOGIST.

Dr. Gally as to the Road-Runner, Etc.

EDITORS PRESS:—I have called that bird the road-runner some hard names, but I do not remember that I ever called him a fool; yet I would have so called him if I believed he would employ for his defense in court such an advocate as your correspondent, "A Prospector" from Cochise county, Arizona, as he appears in *RURAL PRESS* of Sept. 17, 1887. A writer who can talk so glibly about "condemnation," "acquittal," "judgment," and the like, and yet comes into court with nothing that he knows, but only what he has heard some one else say, is a person not worth much attention; for a writer who does not know that "hearsay" testimony is no evidence in any civilized court, is more to be pitied than blamed. If he was born that way it is bad, but if he once had the illumination of common sense and then the darkness of his present condition fell upon the federation of his faculties, it is very, very sad, indeed.

What I wrote about the runner some months ago for your columns was what I saw, when I saw it and where I saw it, and I named the man who saw what, when and where I did. That, unless the witnesses be successfully impeached, is proof, but "hearsay" is no proof; it is hardly good probability.

I gave the road-runner full credit for being a destroyer of reptiles. I had heard that story about the road-runner fencing a basking rattlesnake about with cactus sprouts. I think it is a fiction. It comes from Mexico, a land where fiction is kept on draught. But for your Arizona correspondent's peculiar mental condition, he might be informed that insects produced in swamps, ponds or marshes are not insects injurious to fruits or orchards; also that the tarantula, being the boss spider, is an insect-eater and the friend of horticulture and agriculture, and when the road-runner kills the tarantula he is not "doing the State some service." As to when and what a scorpion eats, I do not, of my own observation, know. I have watched that bug many a time in the deserts of Nevada, Utah and elsewhere for years, and never yet saw a scorpion devour anything. I guess it eats at night.

As to the rattlesnake, now, there is a reptile with which I am acquainted. I have slept with him and among his family—have, in fact, enjoyed his hospitality—and I find that he has faults. But there is one fault the rattler has not, *he doesn't drink*. I have known rattlesnakes, lizards, horned lizards and ants in a dewless desert to be born, raised, live and die 30 miles from water. That is what deceived Moses who was led to believe that the serpent ate dust; because when he was herding sheep for his father-in-law, Jethro, long before he wrote the book, he found the snakes so far from water. [Note.—Your Cochise correspondent is informed that this is not "religion"—only sacred history.] Rattlesnakes down in Cochise and Mexico may "bask" in the sun. I have read many times that basking is the principal rural industry of Arizona and Mexico, and it may well be, in such environment and under the influence of such association, that the serpent has become demoralized; but when and where I knew him the rattlesnake basked with one eye open, and upon the least disturbance of his snooze would gather himself instantly into a coil with his head and tail up and his rattle going like a crazy alarm clock; nor would he move from that attitude, even if it took hours, until he was satisfied all was safe. So, these things being thus, that Mexican story of your Cochise correspondent, that junk-dealer's second-hand revelation about a peck from a road-runner starting a basking rattlesnake off on his travels, through a cactus hedge built by the road-runner, is too thin—or else your Cochise correspondent does not know how to tell it.

Your Cochise correspondent in his effort to say something pert at me, over his cowardice of an assumed signature, accuses me of maintaining a 20-acre marsh to raise mosquitoes, etc. Please say to him two things. First, I bought the marsh to drain it, and it is now drained. Second, Pajaro valley does not raise mosquitoes, codlin moths nor bedbugs; as to the flea—the vivacious *pulex*—to him Pajaro pleads guilty. But there is this, among other things, to be said about the flea, that whereas the housewife must fight bedbugs for a whole family and the industrious orchard man must fight moths for his lazy neighbor, each and every individual must fight his own fleas or take the irritating consequences. If your Cochise correspondent wishes to restore his mind to a normal condition, he might enter upon a course of study or inquiry as to why certain animals—mammalia—certain reptiles, certain insects on the Pacific Coast (so-called), inhabit one mountain or one valley and not another. For instance, the grizzly bear stops at the summit of the Sierra Nevada, and then you go on to the Wasatch mountains and there you find two other bears, not grizzlies, and yet there is no large body of water between the Nevada and Wasatch. So, also the flea stops at the Sierra Nevada (or did some years ago). It may be said that a grizzly could get nothing to eat over in the State of Nevada, and that is the reason he remains satisfied with a bird's-eye view of that State, but that does not apply to the flea, for there

are men and birds and brutes in Nevada with blood in them.

If some savants would figure these things out, they would, for one, much oblige
J. W. GALLY.
Pajaro Valley, Santa Cruz Co., Cal.

SHEEP AND WOOL.

Angora Goat-Breeders' Meeting.

The third annual meeting of the Angora Goat-Breeders' Association of California opened on Thursday, Sept. 22, 1887, at 8 o'clock P. M., at Pioneer hall in Sacramento; President C. P. Bailey of San Jose in the chair, Julius Weyand, secretary.

The proceedings had were as follows:
1st. Calling of the roll of members.
2d. Minutes of last meeting were read and approved.

3d. C. W. Schleiffer of Latrobe, El Dorado county, paid entrance dues.

4th. Election of officers: The old board—C. P. Bailey, president; T. H. Harlan, vice-president; and Julius Weyand, secretary and treasurer, were re-elected.

5th. Report of officers and committees: Secretary and treasurer's report that, expenses deducted, there is a balance of \$9.25 in his hands, is received and approved.

Messrs. Harlan, Bailey and Weyand report that they succeeded in getting the premiums on goats raised by the State Board.

Letters from James Macnaughtan and from F. W. Kitching, New York, containing information of interest to goat-breeders, were read.

6th. Unfinished business: The establishment of an Angora-goat register, laid over from last meeting, was discussed, and

Resolved, That a system of registration of pure-blood Angora goats be established for the State of California; and that, for the guidance of examiners of goats, the shape and fleece of the Angora shall be recognized to be as follows: A perfect goat, when in full fleece, should appear like a right-angled square (parallelogram). The body should be full and long, and of straight build. It should be densely and evenly covered with fine, curly and lustrous silky hair, appearing from a distance as if it had been trimmed off below the body. The chest and shoulders, especially with the male animals, should be broad and strong, the legs straight and chunky, the head clear-cut and trim, not coarse like that of a common goat. The horns of the buck are long and strong, inclined toward the back, and of spiral-like shape, some almost perfect spirals; the horns of the does, short and thin and curved backward. Further

Resolved, That a committee be appointed by the president for the purpose of establishing a scale of points of excellence for examination of Angora goats offered for registration. Adopted.

The president appointed Messrs. Harlan, Schleiffer and Wimmer on that committee, to report at 2 o'clock P. M. to-morrow.

On motion, Prof. E. J. Wickson was by unanimous vote elected an honorary life member of this association.

On motion, adjourned to 2 o'clock P. M. to-morrow, Friday, Sept. 23d.

JULIUS WEYAND, Sec'y.

Friday's Session.

Meeting called to order at 2 o'clock P. M. on Sept. 23, 1887, by President Bailey.

The committee appointed yesterday present their report, as follows:

1st. The Angora goat register is established under the following rules:

2d. That no animal shall be admitted unless it be entirely covered with mohair, without mane or coarse hair.

3d. That no animal shall be admitted unless its fleece and undergrowth of hair be entirely white.

4th. That the applicant for admission shall make an affidavit before a notary public that, according to his best knowledge and belief, the animals in question are descendants of imported pure-bred stock, or shall prove, in any other way the association may hereafter decide upon, in open session, or by a committee, such purity of blood.

5th. Scale of points. Perfection to be 50 points.

Fleece 31 points, viz.: fineness up to.....	9 points.
Weight of fleeces.....	8 "
Evenness and covering.....	8 "
Shape of fleece.....	4 "
Luster.....	4 "
Body 16 points, viz.: constitution.....	6 "
Symmetry of shape.....	5 "
Weight of body.....	5 "
Fancy points, 3—Erblock.....	2 "
Lop ears.....	1 "

Summary.....50 points.

Eligible to Registry.

Animals having less than 40 points of excellence shall not be admitted to registry.

Rules for Fineness of Fleece.

Mohair of factory standard No. 18 (coarsest fiber) shall not count any points with doe fleeces. No. 24 (next fine fiber) counts three points. No. 30 (finer fiber) counts six points. No. 36 (the finest) counts 9 points.

With buck fleeces, No. 18 counts three points. No. 24 counts six points. No. 30 counts nine points.

Kids of both sexes shall not be rated in any way, or be admitted to registry.

Rules for Weight of Fleeces.

Bucks 4 years old and over, 5½ lbs.; of 3 years, 4½ lbs.; of 2 years old, 3½ lbs.; year-

lings, 2 lbs.—each counting 2 points; and for each additional 12 ounces or ¾ lb., 1 point more shall be added.

Does 4 years and over, 3 lbs.; of 3 years old, 3½ lbs.; 2 years old, 3 lbs.; yearlings 2 lbs.—each counting 2 points; and for each additional half-pound, 1 point more shall be added.

RULES FOR EVENNESS OF MOHAIR AND COVERING.

For length of staple, not differing more than 1 inch between shoulder, side and hip.....	3 points.
For exact even length of staple on shoulder, side and hip.....	4 "
For even length of staple on shoulder, side, hip and belly.....	6 "

RULES FOR SHAPE OF FLEECE.

For down hanging, curly fleece.....	1 point.
For down hanging, curly ringlets, close and compact.....	4 "

RULES FOR LUSTER.

For ordinary luster.....	1 point.
For most perfect bright luster.....	4 "

As to 16 points of excellence of body, six points on constitution and five points symmetry shall be left to the judgment of the Examining Committee; and for five points weight of body, a standard shall be submitted hereafter to the committee, by the association.

The report as appears was received, and upon motion was adopted.

On motion, the following was adopted:

Resolved, That the Angora Goat-Breeders' Association of California in convention assembled have adopted that they will use all honorable means to urge upon our next State Legislature to pass scalp laws for the destruction of wild animals in this State, and also that they will demand of, and urge upon, the National Congress to better protect our infant industry by tariff laws and regulations which are just and encouraging to those engaged in this business of mohair production; and that we will support no person whatever to an office in our Legislature or Congress who will not promise his full and vigorous assistance to carry out our demands.

On motion, adjourned to meet on the last Thursday of the State Fair at Sacramento, in 1888, unless called by the president.

C. P. BAILEY, President.

JULIUS WEYAND, Secretary.

THE FIELD.

Potatoes in the Silver State.

The *Virginia Enterprise*, of last week, remarks that if the State of Nevada is particularly noted for any production in the agricultural line, it is for raising good spuds, and lots of them to the acre.

A rancher at Lovelock planted this year exactly 100 acres to spuds. His crop will be fully up to the average, which is eight tons to the acre—an extraordinary yield for the best spud-countries in the world. He will get one cent per pound for them delivered at any shipping point on the Central Pacific, bringing him a return of \$16,000 for the 100 acres, or \$160 per acre. The entire cost of cultivating his broad acres is under \$40 per acre, including seed, water and all, except clearing the ground. Including the cost of clearing the ground, that is, cutting the brush, grubbing and leveling, it might cost him \$80 per acre—including all this, we say that the farmer gets \$80 per acre, which is a better return than can be had from the best acre of land in California, if it is not garden land. It is impossible to figure on the cost of bringing water to the land, but there are many places where it can be had advantageously.

On the Carson river, opposite Dayton, John Gallieri has an 80-acre ranch, which he is constantly enlarging. It is the levellest piece of ground on the coast. Every inch of the ranch can be irrigated by simply raising a few gates. If they were connected by electric wires he could sit in his parlor and irrigate the entire ranch, by simply touching the keys. He has about 50 acres planted in potatoes and the rest in garden truck and hay for his stock. He sells his potatoes, as do all other ranchers in that vicinity, to the Sacramento market, receiving one cent per pound delivered at the depot of the Carson & Colorado railroad at Dayton, scarcely a mile from his ranch. Mr. Gallieri's crop will average this year ten tons to the acre, and he has often raised an average of 12 tons per acre.

The Quilici brothers own the old Barrett & Fish ranch, situated about a mile south of Gallieri's, and raise about 30 acres of potatoes each year. In 1884 this ranch was flooded by the Carson river overflowing its banks, and they sued C. C. Stevenson for damages, alleging he had raised a dam in the river, and that it was the cause of the overflow. They had to prove the damage they sustained. Fish, a man of good education, the former part owner in the property, testified that he had made a bet with Quilici that they did not have 21 tons of potatoes on a given acre of ground, and he lost his money, for they dug up and weighed 21 tons and 200 pounds right before his eyes from an acre of ground that they measured. Where on earth can such a spud record be approached?

There are not many ranchers on the Carson river, and they don't all raise large quantities of potatoes, but this year they will ship at least 3000 tons of potatoes to Sacramento, besides supplying this local market. A ton of potatoes at this season of the year will scarcely weigh 1500 pounds next spring, owing to evap-

oration. That is the reason ranchers sell their potatoes in the fall, and why they are so dear in the spring, for there is no great cost attached to keeping them over winter, and the rate of interest on money is not high enough to justify such a raise yearly in the price of potatoes.

Of course the general fact that we raise such large potatoes in this State leads farmers to exaggerate about their size; but John Gallieri, for a valuable consideration, has undertaken to supply Charley Noce, the North C-street merchant, with a potato weighing seven pounds; another has promised to bring him one eight inches in diameter, and Mr. Noce has promised to bring them to the *Enterprise* office.

How Plants Feed.

A plant will feed upon itself for a time, or rather, will feed upon what its predecessor left as a sort of inheritance for this very purpose—that is, upon the accumulations of the plant living the preceding season. So it is that when a seed is planted, as it is called, the young plant within the seed is unable to forage for itself and must therefore depend upon this stored material to push it forward into visible life. The same is true of the bud of the tree awakening into life; it derives its first sustenance from the reserve accumulations of the parent stock during the autumn previous. In either case a certain degree of heat and a trifle of moisture are necessary to awaken the dormant energies, except in those cases where there is also moisture held in reserve, as is the case with tubers and roots. Heat alone, at the season appropriate, will be sufficient to cause young plants to commence to grow. Each kind of plant, each individual plant, and in fact every part of a plant, feeds and performs its life-work best at a certain temperature, and ceases to work when the temperature rises above or falls below that temperature. Practically no plant will feed when the temperature is reduced to the freezing point.

When a suitable temperature and sufficient water are necessary to the growth of plants, an excess or deficiency may be disastrous, either of which conditions is liable to occur in spite of the farmer, and yet to some extent, by choice of aspect, site, shelter, and other means, and by drainage, the farmer can, to some extent, regulate the temperature and water that his crops would be subjected to. Water is essential not only in the feeding process, but with every action of plant life. Generally there is no lack of water; the earth and the air contain their respective shares of this elementary compound in varying proportions and in varying modifications of liquid and gaseous. Besides this, the plant itself has constantly on hand a share which constitutes a large proportion of its entire weight. Now the rule is that when the seed, the bud, or the plant is at its deepest state that growth begins, and the demand for water becomes imperative. How is the demand supplied? How does it get into the plant? even if there is no lack of it. To answer the question brings us to the consideration of the raw material, and the fabric of the plant by which it gains entrance.

EFFECTS OF BEER.—In appearance, the beer-drinker may be the picture of health, but in reality he is most incapable of resisting disease. A slight injury, a severe cold or shock to the body or mind will commonly provoke acute disease, ending fatally. Compared with inebriates who use different kinds of alcohol, he is more miserable, more generally diseased. The constant use of beer every day gives to the system no recuperation, but steadily lowers the vital forces. It is our observation that beer-drinking in this country produces the very lowest form of inebriety, closely allied to criminal insanity. The most dangerous class of ruffians in our large cities are beer-drinkers. It is asserted by competent authority that the evils of heredity are more positive in this class than from other alcohols. Public sentiment and legislation should comprehend that all forms of alcohol are dangerous when used.—*Scientific American*.

HOME-MADE ICE.—Take a cylindrical earthen vessel and pour 3½ ounces of commercial sulphuric acid and 1½ ounces of water into it, and then add one ounce of powdered sulphate of soda. In the center of this mixture, place a smaller vessel containing the water to be frozen; then cover the vessel, and, if possible, revolve the whole with a gentle motion. In a few minutes the water in the small vessel will be converted into ice. The same mixture can be used a second or third time for making a block of ice. The operation should, if possible, be performed in a cool place, in a cellar, for example.

PROGRESSIVE AGRICULTURE.—Agriculture has become an acknowledged science. Prof. Sanborn of the Missouri Agricultural College, says: "The time has passed when a successful farmer can be a mere clodknocker. He must be a business man and an educated man. If farmers want to fit their sons to cope most successfully with the difficulties that are sure to beset them in the calling of a farmer, let them avail themselves of the opportunity afforded for a practical farm education in a good agricultural school."

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Grange Officers.

Officers of National Grange.

Master—Put Darden of Mississippi.
Overseer—Jas. Draper of Massachusetts.
Lecturer—Mortimer Whitehead of New Jersey.
Steward—J. E. Hall of West Virginia.
Asst. Steward—W. H. Stinson of New Hampshire.
Chaplain—A. J. Rose of Texas.
Treasurer—F. M. McDowell of New York.
Secretary—John Trimble, 514 F St., Washington, D. C.
Gatekeeper—H. Thompson of Delaware.
Ceres—Mrs. Kate Darden of Mississippi.
Pomona—Mrs. S. H. Neal of Kentucky.
Flora—Mrs. Jas. C. Draper of Massachusetts.
Lady Asst. Steward—Mrs. E. M. Lipscomb of South Carolina.

EXECUTIVE COMMITTEE.

J. M. Blanton of Virginia, Chairman.
J. J. Woodman of Michigan, Secretary.
J. H. Brigham of Ohio.
Put Darden of Mississippi, ex-officio.

Officers of the State Grange.

Master—Wm. Johnston, Richland, Sac'to Co.
Overseer—W. L. Overhiser, Stockton, San Joaquin Co.
Lecturer—Daniel Flint, Sacramento, Sac'to Co.
Steward—Don Mills, Santa Rosa, Sonoma Co.
Asst. Steward—E. W. Davis, Santa Rosa, Sonoma Co.
Chaplain—B. F. Frisbie, Yuba City, Sutter Co.
Treasurer—I. C. Steele, Pescadero, San Mateo Co.
Secretary—J. Chester, 40 California St., S. F.
Gatekeeper—J. E. Beach, Routiers, Sacramento Co.
Ceres—Mrs. S. J. Cross, Antelope, Sac'to Co.
Pomona—Mrs. A. P. Roach, Watsonville, Santa Cruz Co.
Flora—Miss Minnie M. Plummer, Brighton, Sacramento Co.
Lady Asst. Steward—Miss Mary J. Carter, Byron, Contra Costa Co.
Executive Committee—A. L. Chandler, Nicolaus; J. F. Deming, Vallejo; H. G. Keesling, San Jose.
District Lecturers Appointed by the Worthy Master.
Geo. P. Loucks, for Contra Costa Co.
Nicholas Mertes, for Placer Co.
B. F. Frisbie, for Sutter Co.
G. W. Hancock, for Sacramento Co.
J. D. Huffman, for San Joaquin Co.
Walter Renwick, for Alameda Co.
E. T. Blackmer, for San Diego Co.
J. C. Marsh, for El Dorado Co.
J. F. Gregg, for Amador Co.
J. R. Totman, for Colusa Co.
Geo. Steele and D. F. Stockdale, for San Luis Obispo Co.
A. Henderson, for Nevada Co.
A. B. Huntley, for Plumas Co.
T. C. Alexander, for Los Angeles Co.
H. W. Brouse, for Merced Co.
V. E. Bangs, for Stanislaus Co.

The Grange and Living Issues.

[Read by J. W. Mackie before Tulare Grange, Sept. 19, 1887.]

What is the Grange for? What good can I receive, what good can I do by becoming a Patron of Husbandry? are almost the invariable questions put when men and women are solicited to join our Order. They are pertinent questions, demanding clear, well-defined answers.

Of course there is something pleasing, something which our nature demands, in every kind of social gathering, whether in the lecture-room, the dancing party, the lodge or the church, when the social magnetic current unites all in one common feeling. But beyond this pleasing social intercourse, beyond the party feeling generated in these gatherings, and natural to us all, which delights in having whatever we are connected with ahead of everything of its kind in numbers and efficiency; beyond the pardonable pride of having the ritualistic work of our Order done as correctly and as impressively as possible; beyond all these good things and every good thing of a social character, what other good things have we a right to expect from our connection with the Patrons of Husbandry? In the broader fields of municipal, State or national affairs have we, as Grangers, a part to perform, benefits to receive, with commensurate duties and responsibilities incumbent upon us?

Not long ago the great political parties of the people seemed in danger of dying of inanition. Like the bears in winter, they were living on the fat they had accumulated during the glorious summer of their usefulness. They could present no great, well-defined, dividing, distinguishing issue. Consequently disintegration of party lines has been going on at a rapid rate, accelerated by the presence of living issues springing into being independently of party lines and party platforms.

The sovereigns of America are now called upon to vote for principles and not for a party, to meet these living issues. We are called upon to decide how far the Government can interfere, and whether it should interfere with the ownership of land, its taxation and general management; with labor and its rights and duties; with private and corporate enterprises; with the transportation facilities of the country; with the national finances and banking business; with the manufacture and sale of intoxicating liquors and many other questions relating to the Government and the welfare of the people. We are even called upon to define and determine what the Government itself really is, whether it is something distinct from and above the people, or simply the people themselves. And to come nearer home, nearer the interest of every farmer, we are called upon to discover by discussion, co-operation or any other means or avenue of escape from disgraceful and ruinous corners in wheat, such as has lately demoralized every legitimate transaction in grain, how we can avoid passing the products of the farm into the hands of speculators, who only pay the farmer what they are pleased to give.

How long are we to be the playthings and victims of the thimble-riggers of commerce, who, while possessing millions, stoop to tricks that would disgrace the lowest followers of an agricultural fair, which you know, like agriculture itself, has passed into the hands of speculators and gamblers?

Can the Grange do anything? Is it within its province to set in motion the machinery that will break the shackles which seem to bind the business of the country, as well as county, State, and National Government? We cannot elect a governor, a mayor, or even a justice of the peace, without bending our necks and accepting nominations from a class of men we would be ashamed to be seen talking to, and would forever after feel degraded thereby. When will we be able to take any political action without first consulting the proprietors of saloons and deadfalls? Can the Grange take any steps to liberate us from this fearful degradation and place us where we can have a decent control of our own affairs?

I put these questions expecting a reply from the officers of the State Grange who have honored us with their presence to-day, or from the State Grange itself to be convened next month. As an individual, I think I know what my duty in these matters is and what the duty of the individual Granger is; and in thus publicly declaring what I think of duty, I am doing it in the presence of those who can, and whose duty it is to, correct or indorse.

It is time that honest industry, [intelligent morality and spiritual intelligence were liberated from the domination of everything that is vile and false. It is time that a united effort, with simultaneous action, should be inaugurated in all the Granges, whereby this matter should be brought up for free and full discussion, and also to determine the best possible means whereby the products of the farm can reach the great centers with the least possible manipulation of middlemen.

These discussions should be reported as far as possible to the RURAL PRESS and the Patron, who would, from the whole, gather the more salient points and present them in a condensed and more acceptable form to the people.

Something must be done to save us from the fearful octopus which has us in its grasp, its every tentacle holding and squeezing us like a vise, and, through a subsidized, weak-kneed, prejudiced press, covering all its operations in inky darkness. I ask, I hope, the Order will demand from the State Grange, through its officers and delegates, a scheme—an efficient scheme—by which we can all work at once, intelligently and practically.

Co-operation is the seeming watchword of the Grange, and I find new members looking for immediate steps being taken by the Grange toward establishing co-operative stores and a magical process by which we can be lifted somehow out of the depths of pinching poverty and straitened circumstances; and I find old, retired members of the Grange afraid of reuniting for fear of being bitten by some Utopian scheme of co-operation. Is there no middle place, where good sense reigns and honesty prevails? For example, we can reduce our freights by uniting in carloads; we can reduce prices by buying at wholesale; we can co-operate in expensive machinery, if we are honest and true; we can do many things within our own immediate circle by a little tact, forethought and united effort without being incorporate bodies.

This action, I know, will be confronted by the statement that we should patronize the merchants of our own place, and so help to build up the town. All I have to say is that the merchant can, if he will, help us in this matter; at the same time I enter my protest against the illusive statement that we owe anything to the town. It is not the town which builds the country, but the country builds the town for its own convenience.

A prosperous farming community can get along, though there should not be a saloon or a grasping speculator within 50 miles of it. I for one feel like casting defiance in the teeth of the vampires and parasites of the town who feed on the farmer and believe themselves to be the community, and that all should obey them. These are some of the home points over which we have some control.

Let me add, I have not said one word against legitimate merchandizing. It is a mutual convenience—only we have the right to do the best we can. This theme might be carried on indefinitely, so I will close at this point, thanking you all for a patient hearing, hoping that I have been able to make sufficient suggestions to form the basis of an interesting and instructive discussion.

MERCED GRANGE has been auspiciously reorganized by Bro. Overhiser, assisted by Bro. Amos Adams, and they have high hopes of organizing a new Grange at Washington Colony, Fresno, some time next month.

DIRECTORY OF SUBORDINATE GRANGES IN CALIFORNIA.

NAME OF GRANGE.	PLACE AND DATE OF MEETING.	MASTER.	SEC'Y AND ADDRESS.
Alhambra.	Martinez, 1st and 3d Sat.	Dr. J. Strentzel.	Maria B. Lander, Martinez.
American River.	Routiers, 2d and 4th Sat.	D. W. Taylor.	Jas. C. Cornell, Routiers.
Antelope.	Antel. S. H., 1st and 3d Sat.	H. A. Logan.	P. Peterson, Maxwell.
Bennett Valley.	Bennett Valley, 1st and 3d Sat.	Don Mills.	J. B. Whitaker, Santa Rosa.
Buena Vista.	Delano, 2d and 4th Sat.	E. D. Wheatley.	J. I. Morgan, Delano.
Carpinteria.	Carpinteria, every other W.	H. D. Woods.	Mrs. J. M. Higgins, Carpinteria.
Ceres.	Modeato, 4th Friday.	V. E. Bangs.	R. K. Whitmore, Ceres.
Clarksville.	Clarksville, 1st Saturday.	C. M. Chapman.	Samuel Kyburg, Clarksville.
Danville.	Danville, 1st and 3d Sat.	R. O. Baldwin.	Millie S. Howard, Danville.
Eden.	Haywards, 2d and 4th Sat.	J. Chester.	Josie Shari, Haywards.
Elk Grove.	Elk Grove, 1st and 3d Sat.	Thos. McConnell.	Delos Gage, Elk Grove.
Elliott.	Elliott, 2d and 4th Sat.	E. Hart.	H. H. West, Elliott.
Elmira.	Elmira, 2d and 4th Sat.	G. W. Tillotson.	Mrs. J. McCrory, Elmira.
Enterprise.	Brighton, 1st and 3d Sat.	W. A. Birch.	Lettie Haulon, Brighton.
Eureka.	Columbia S. H. near Auburn.	C. L. Corwin.	Annette Putney.
Florin.	Florin, 2d and 4th Sat.	John Reese.	L. H. Fassett, Florin.
Franklin.	Franklin, 1st Saturday.	L. Freeman.	M. B. Johnston, Richland.
Galt.	Galt, 1st and 3d Saturday.	Hiram Chase.	A. B. Bryant, Galt.
Georgiana.	Isleton, 4th Saturday.		
Grand Island.	Sycamore, 2d and 4th Sat.	J. B. Totman.	E. G. Morten, Colusa.
Grass Valley.	Grass Valley, 2d and 4th Sat.	J. W. Stewart.	A. Henderson.
Lincoln.	Lincoln, 3d Saturday.	J. S. Philbrick.	A. J. Soule, Lincoln.
Lodi.	Lodi, 1st and 3d Wednesday.	C. W. Norton.	J. D. Huffman, Lodi.
Lompoc.	Lompoc, every other Sat.	L. F. Potter.	W. H. Schuyler, Lompoc.
Luerne.	Hanford.	W. M. Ogden.	C. S. Sellers, Lemoore.
Magnolia.	Imile N. of Bear River, 2d S.	V. W. Scull.	May F. Bilderback, Colfax.
March.	West Butte, 2d Sat.	M. C. C. Partridge.	Mrs. S. I. Noyes, West Butte.
Merced.	Merced, 1st Saturday.	R. S. Clay.	L. A. Ostrander, Merced.
Montezuma.	Bird's Landing, 1st & 3d Sat.	T. T. Hooper.	Ettie Daniels, Bird's Landing.
National Ranch.	National City, 1st & 3d W.	R. D. Perry.	Maria D. Grant, National City.
Newcastle.	Penryn, 2d Saturday.	Wm. Barter.	Wm. H. Scott.
North Butte.	Pennington, 2d and last Sat.	W. Hedger.	Jennie Hedger, Live Oak.
Ojai.	Nordhoff, every other W.	R. Robinson.	S. C. Gridley, Nordhoff.
Paso Robles.	Paso Robles, 1st and 3d Sat.	D. F. Stockdale.	A. N. Rude, Paso Robles.
Pescadero.	Pescadero, 1st Saturday.	I. C. Steele.	Mattie Thompson, Pescadero.
Pilot Hill.	Pilot Hill, S.	Mrs. A. Dobbis.	F. Wentworth, Georgetown.
Placerville.	Placerville, every other wk.	Albert Norris.	Annie E. Bliss.
Plumas.	Beckwith, 1st and 3d Sat.	R. G. Hamlin.	A. B. Huntly, Beckwith.
Plymouth.	Plymouth, 2d and 4th Sat.	W. M. McMillen.	J. F. Gregg, Plymouth.
Point of Timber.	Byron, 1st Saturday.	A. Plumley.	Eva Preston, Byron.
Potter Valley.	Potter Valley, every other wk.	W. A. Grover.	W. V. Kilbourne, Potter Valley.
Poway.	Poway Valley, 2d & 4th Sat.	S. Palmer.	J. Anderson, Poway Valley.
Roseville.	Roseville, 1st and 3d Sat.	Lee D. Thomas.	Mattie Leavell, Roseville.
Sacramento.	Sacramento, 2d and 4th Sat.	W. W. Greer.	Frankie M. Stevens.
San Jose.	San Jose, every Saturday.	H. G. Keesling.	E. T. Pettit, San Jose.
Santa Cruz.	Santa Cruz, semi-monthly.	G. O. Wardwell.	B. Pilkington.
Santa Rosa.	Santa Rosa, 2d and 4th Sat.	E. W. Davis.	Martha Lumsden, Santa Rosa.
Sebastopol.	Sebastopol, semi-monthly.	Jas. P. Gannon.	C. Wightman, Sebastopol.
Sierra Valley.	Sierra Valley, every other W.	G. P. Haines.	N. N. Strang, Sierra Valley.
Snelling.	Snelling, every other W.	Geo. P. Kealey.	S. K. Spears.
Social.	Mich. Bar, 2d and last Sat.	W. H. Atkinson.	Mrs. H. E. Putnam, Mich. Bar.
South Sutter.	Pleasant Grove, 4th Sat.	Jno. W. Jones.	Ella M. Jones, Pleasant Grove.
St. Helena.	St. Helena, 1st and 3d Sat.	J. G. Norton.	W. Peterson, Sr., St. Helena.
Stockton.	Stockton, every Saturday.	T. E. Ketchum.	N. T. Root, Stockton.
Sutter Mill.	Coloma, 1st and 3d Sat.	F. J. Veerkamp.	F. Veerkamp, Coloma.
Temescal.	Oakland, O. F. hall, 1st Sat.	A. T. Dewey.	Nellie G. Babcock, N. Temescal.
Tulare.	Tulare, 1st and 3d Sat.	A. P. Merritt.	Courtney Talbert, Tulare.
Turlock.	Turlock, 2d and 4th Sat.	P. R. McCabe.	E. B. Osborn, Turlock.

¶Saturday after full moon.

State Grange Suggestions.

All who can come should attend the State Grange. There will be much said and done which cannot be reported through the open columns of news prints that Patrons will be most specially interested in.

We hope that most of the Past Masters of the State Grange will be present at the coming session, and even Brother Webster, before the session closes, although he will not promise to come. It is worth a pilgrimage to meet such grand old patriarchs at our annual Grange sessions, and receive their hearty greetings, and listen to their earnest words of wisdom and good cheer.

Come early to the State Grange session, as those who listen to the opening exercises have a better understanding and a more perfect enjoyment of the rest of the proceedings.

Everybody expects a good annual address, of course, from the Master, and reports from the Lecturer, Secretary and other officers. We suspect the address of welcome will be delivered by the able and eloquent Master of Santa Rosa Grange, and be responded to by one of Sacramento's talented sons. (W. W. Greer, W. M. of the Subordinate Grange.) We are confident that these exercises will be of more than usual interest, and are glad to see that indications are bright for a most exceedingly interesting session throughout for the welfare of the Order, and most rarely so for those who attend.

The Secretary of each Grange should furnish a certificate of election to their alternate representatives to be presented at the State Grange.

Members of the Fourth Degree are entitled to receive the Fifth Degree at the State Grange upon payment of the customary fee of two dollars each. They should have a certificate showing their good standing as Fourth Degree members in their own Grange, or otherwise be able to prove satisfactorily to the State Grange that they are members in such standing. Masters of Granges and their wives, of course, have no membership fee to pay to receive the Fifth

Degree. The Fifth Degree (Pomona) will likely be conferred on Friday night.

We hope such members as have usually contributed to the entertainment of the State Grange but who cannot be present at this session will write letters or articles to the Literary Committee to be presented as occasion occurs. Also that other able and earnest members will do likewise.

The Grange work in this State for the past few years has been going on rather quietly, for various reasons. It now behooves the Patrons at the coming session to make plans for a most active campaign. It is time for extra work. There are good, strong laborers in the field who will show their strength and build up the work in this State, if encouraging plans are devised and properly set before them. There is no good reason why work should not be taken up and carried forward in perfect harmony and with greater success and power than has been evinced during the past 10 years. Let all act with an eye single to such a glorious result.

We would suggest that Patrons from all sections of the State bring with them rare specimens of produce and all such articles as would be interesting to exhibit at the National Grange which meets at Lansing, Michigan, November 16th. Thus a starting point would be gained for a larger exhibit to be made for California by the Worthy Master of the State Grange. There is much that could be said in favor of such action. The benefit, however, is obvious to the minds of all Patrons who may have anything to contribute.

Co-operation is a subject which, we think, it would be well for the State Grange to consider, and if possible, set the ball in motion for organizing co-operative associations on the Rochdale plan in various sections of the State. Quite a number of pamphlets and periodicals, received from the Rochdale Co-operative associations in England will be on file for examination by Patrons who wish to become informed of the immense success and most astonishing benefits that co-operation has bestowed upon the great mediocre and working classes of England.

It would seem appropriate for our State

Grange to invite the National Grange to send the National Lecturer, Mortimer Whitehead, to California during the next year, a field which has never yet been visited by the National Lecturer, or officially visited by any officer of the National Grange since Brother N. W. Garretson, Organizing Deputy, organized so successfully a goodly number of subordinate Granges, and the State Grange in 1873. In fact, we think it would be a good plan to call upon the Patrons of Oregon, Nevada, Colorado, and other Western States, to unite in inviting the National Grange and National Lecturer to cross over to this side of the continent, and give the benefit of their good words and inspiring presence.

Some provision might well be made at this session of the State Grange for a Pacific States' picnic, whereby the Grangers from all parts of the coast could profitably come together for exchange of opinions, sociability and co-operation.

Going to State Grange.

As this is the last issue of the RURAL before the meeting of the State Grange at Santa Rosa, it may be well to say to all who expect to attend the session that they should take the Donahue Broad Gauge R. R. via ferryboat Tiburon, leaving San Francisco at 7:45 A. M. and 3:30 and 5 P. M. Ask for "Granger's round-trip ticket." Pay \$2 for it. Have it countersigned at Santa Rosa by E. W. Davis, otherwise the ticket will not be good for return trip.

There will be rooms in private families for those who attend the State Grange, provided they do not want to stop at any one of the hotels. Hotel rates have been reduced, and accommodations will be ample for the large number of guests who may be in attendance.

The Feast of Pomona will be held at the Rink on Fourth street, Santa Rosa. The room is on the ground floor, large, well-ventilated, and will be lighted with the electric light. John Adams and a host of able lieutenants are busily at work, engaging and collecting fruits for the Feast. Brother Adams says he will have enough and to spare of the finest products of orchard, vineyard, garden, kitchen and flower garden. See the Feast that will be spread for Pomona! It will pay for your trip to Santa Rosa. Then the literary, social and musical entertainments given at the session will be a treat worthy of the cause and the occasion.

Take your badge or sash with you when you go to Santa Rosa. Then you will be sure to have your insignia of office, and you will also be sure to have the proper regalia.

There is plenty of work at the sessions of the State Grange; yet, after all, it is one of the pleasantest weeks of the year. The greetings and meetings are truly delightful. Good vocal and instrumental music, choice readings, instructive essays, excellent extemporaneous speeches, and a jolly good time generally, go to break up the monotony of every-day life.

Santa Rosa is a thrifty city with genial climate, beautiful streets, commodious halls, good hotels, three trains a day from and to S. F., enthusiastic Grangers, hospitable people, successful farmers, excellent schools, churches of various denominations, and Lodges of all kinds. It is therefore a suitable and proper place for the State Grange to meet. Go to Santa Rosa, and you will say you never had a better time.

"Music hath charms." It is hoped that every Patron who expects to attend the State Grange will make up his or her mind to assist in the singing. There is nothing that causes time to pass more pleasantly than one of the good old Grange songs—the older the better—in which everybody takes a part. Remember, Patrons,

"Tis toil that over Nature gives man his proud control.
It purifies and hallows the bosom of his soul."

Or that other grand old song, "Work, for the Night is Coming." Let every one sing, both with the spirit and the understanding.

A Representative Matron.

Miss C. A. Hall, whose likeness appears upon this page is the niece of O. H. Kelley, the originator of the Patrons of Husbandry and first Secretary of the National Grange. He early imparted to her his idea of forming a secret society of agriculturists as an aid in promoting fellowship between the people North and South, and found her a sympathetic and valuable counselor. The principle of giving women full membership in the Order was adopted at her suggestion. On the permanent organization of the National Grange in 1873, she was chosen Lady Assistant Steward. She it was who rendered the grateful service of compiling the songs of the Grange.

We would call the attention of Patrons visiting Santa Rosa, and seeking first-class accommodations, to the advertisement of the Occidental, the principal hotel of that city, which appears in our columns to-day.

We are sorry to learn of the recent illness of Brother George Wilson of Enterprise Grange. His friends will be pleased to hear that he is now better and still improving.

Tulare Grange.

EDITORS PRESS:—Bros. Overhiser and Adams attended a special meeting of Tulare Grange, No. 198, for the purpose of conferring the third and fourth degrees of the Order, on Monday, Sept. 19th. A Harvest Feast for the occasion was gotten up by the brothers in the rooms of the Cosmopolitan restaurant, permitting the sisters the full enjoyment of a feast to which the slavery of neither cooking nor dish-washing was attached. Everybody looked happy.

After justice had been done to everything, including the ice-cream, we again marched in couples to our fine hall, when Bro. Overhiser gave the unwritten work to the newly-made brothers and sisters. Lack of time prevented our brother from illustrating this work as fully as he would have liked, and as fully as it deserved, but what was done helped very much to re-impress it on the minds of the older members; after which the Grange was given up to the Good of the Order.

A committee appointed on Saturday had selected for discussion, "The Duty of the Grange in Relation to the Living Issues of the Day," and the writer to deliver the introductory essay, which you will find inclosed, in accordance with a motion made by Bro. Overhiser and carried by the Grange.

In relation to the essay, Bro. Adams believed in a more conservative and conciliatory method than denunciation and epithets; that very much

are glorious meetings. The old soldiers renew former friendships, and live over again events of the days that are gone.

Hotel Rates for State Grange.

All the hotels at Santa Rosa are making special reduced rates for those attending State Grange next week, as follows:

Grand hotel	Per day.
and Single person	\$1 50
Occidental Two in one room, each	1 25
Magnolia house	1 25
Eagle hotel	1 00

Any Patron who may desire rooms, or any information pertaining to the session of the State Grange that is to be obtained at Santa Rosa, can get the same on application to E. W. Davis, W. M. of Santa Rosa Grange.

Pomona Granges of California.

SONOMA CO., No. 1.—Meets third Wednesday of January, April, July and October, at 10 A. M. M. G. N. Whitaker; Sec., Don Mills, Santa Rosa.

SACRAMENTO CO., No. 2.—Meets fifth Saturday of mos. having a fifth Saturday, at 1 P. M. M., A. A. Krull; Sec., W. W. Greer, Sacramento.

SAN JOAQUIN CO., No. 3.—M., W. L. Overhiser; Sec., J. D. Huffman.

GRANGE VS. RAILROAD.—The recent case in Vermont, where the State Grange scored

Fraternally,
C. A. Hall.

had been conceded by the railroad magnates, when met in a business and gentlemanly manner; that farmers had better let merchandizing alone, as merchants should let farming alone, each working in the line he understood the best.

Bros. Maples, Hawkins, Fowler, Wright and others followed in enthusiastic warmth; that they were not seeking favors, but rights, and spoke of the State Grange as having done very little for the special benefit of the farmer. Bro. Overhiser steered in between the parties, with his usual tact and good humor. Altogether it was a day of enjoyment which will live long in our memories. Bros. Maples, Wright and myself have been appointed a committee to draft resolutions embracing a remedy for all those crying evils which are the source of so much agitation, which our delegates will carry to the State Grange. When the mountain labors, I will let you know the result.

J. W. MACKIE.

Tulare, Sept. 21, 1887.

THE METEOROLOGICAL LECTURE.—The promised paper by Lieut. J. E. Maxfield, on "Rain and Frost in California," will probably be read before the State Grange on Wednesday. Coming from the Chief Officer of the Signal Service upon this coast, it bids fair to prove one of the most important addresses of the session; and should Lieut. Maxfield's engagements permit, an opportunity will be afforded the farmers to discuss points of interest with the lecturer and elicit valuable information.

DURING the State Grange session, the members of Ellsworth Post, G. A. R., located at Santa Rosa, will give a grand campfire. The occasion will be a joyous one, and those who are fortunate enough to be invited will have a good time. There will be a few short speeches, some fine music and pork and beans, with hard-tack and coffee as relishes. These campfires

feet of the buildings. The origin of the fire is supposed to have been a carelessly dropped cigarette.

Inyo.

DISTRICT FAIR POSTPONED.—Dispatch to Associated Press. Independence, Sept. 26: The first fair of the Eighteenth district, consisting of Alpine, Mono and Inyo, will be held at Independence, Oct. 10th to 14th. The buildings are new and the grounds will be used for this purpose the first time. The prospects for a splendid show are good.

Marin.

FIRE AND MESQUIT GRASS.—Petaluma Courier: A gentleman residing in Marin county had a portion of his brush land burned over last year, and to try an experiment sowed about 100 pounds of mesquit grass seed right on top of the ashes and debris left by the fire. The result was a good crop of feed this year on land that was formerly so thickly covered with chaparral that the cows could not get through it. We advise ranch-owners whose land was recently burned over to try the same experiment.

San Diego.

JULIAN DECIDUOUS FRUITS.—Julian, the banner district of San Diego county in the production of deciduous fruits, has placed before the visiting public a local pomological display. It includes apples, pears, peaches, plums, prunes and grapes, from the orchards of Balena, Mesa Grande, Banner and Spencer valley. The largest Bartlett and Winter Nelis pears measure over one foot in circumference, and there are luscious Crawford peaches measuring 9½ inches. The girth of one of the apples grown in that section is 14½ inches, and, in addition to their remarkable size, these fruits cannot be surpassed for fineness of flavor, grain or conformation.

San Joaquin.

SECOND-CROP BARLEY.—Stockton Independent, Sept. 21: The second crop of barley is now growing on Staten Island in the extreme northwestern part of this county, and now stands six inches high. The farmers expect to make a good hay crop if cold weather comes before the grain matures.

San Mateo.

MENDING A PIGEON.—Redwood Times and Gazette: One of Mrs. Percival Selby's children, at Menlo Park, performed a successful piece of ornithological surgery recently. A young pigeon had been bitten so badly by a dog that its crop was torn open. One of the children covered the wound with a piece of linen made to adhere by gum arabic.

Solano.

EDITORS PRESS:—The weather is quite sultry, with cool nights. A light shower fell last Wednesday night. Fruit-picking is about done, except grapes and some late peaches. Not many apples are raised here. Grapes are sent East every day. The dried-fruit trade has turned out far larger than any one expected. Mr. Blum has sent East from Vacaville 28 carloads of dried fruit. Several in the neighborhood have dried from 30 to 50 tons. W. Pleasant has dried 30 tons of peeled peaches, besides a large crop of apricots. Baled hay is worth from \$11 to \$13 per ton. Straw sells at \$1 per load loose in the field. The grain market is dull, and people that have not sold are not pleased with the prospect. Some land is selling here, but not a great deal, as those that have orchards and vineyards know that they are sure of good pay if they tend their places well. This season has convinced most of the people that there is a good profit in raising fruit to dry, even if the prices paid were one-third less than this year. In this valley, if a person has a good drying peach, he can raise and dry peaches, sell them at four cents a pound, and make money. The Muir is the best drying peach; after this the Salway, Susquehanna, Mixon Free, Crawford and Strawberry. In setting out an orchard, either for drying or sending to market green, about four kinds should be put out, so that there will be one kind ripe and gone before the others come in.—G., Vacaville, Sept. 25th.

Sonoma.

SANTA ROSA SPUDS.—J. L. Williamson, who owns a fine ranch about 1½ miles west of Santa Rosa, has placed on exhibition in the window of the Republican office a cluster of potatoes, Burbank seedlings, composed of 11 well-developed potatoes, the largest measuring seven inches in length and nine inches in circumference.

Tulare.

WILD SUNFLOWERS TOO THRIFTY.—Delta, Sept. 22: Now is a good time to out the wild sunflowers that have threatened to take a number of farms in this vicinity. John Harter has had them cut on the land south of town that he recently purchased from George Webb, and we would like to see others do the same. Before many days the seeds will fall and be scattered over the ground so thickly that next season's crop will choke any cereal or other crop that may be planted. They should be cut at once and burned.

Ventura.

BEAN CROP.—Saticoy Cor. Free Press, Sept. 23: Farmers are getting ready to thrash their beans. The crop will not yield so well as was anticipated. The acreage is much less than last year, and the canning establishments in Boston and all over the East are short of stock and have cleaned out this coast pretty well. If farmers will stand together they may realize \$3.50 and \$4 per hundred for Limas.

AGRICULTURAL NOTES.

CALIFORNIA.

Contra Costa.

NEW PAVILION.—Martinez Gazette, Sept. 24: A new pavilion is in course of construction at the fair grounds—34x60 feet and 20 feet to the eaves. The building is so planned that at some future time galleries can be built on two sides. It will have a handsome front with large windows and double doors at the main entrance. Jos. Beaudette of Concord, the builder, is working a large force of men to complete the structure in time for the fair which opens October 3d. It is a much-needed improvement.

Lassen.

IT BEGAN AS USUAL.—Susanville Mail, Sept. 21: One day last week, while the thrashers were engaged at the residence of Al. De Forest, they discovered a fire in the rye grass between the house and milk-house. Running to the place they succeeded by the use of wet grain sacks in putting out the fire when within a few

Country School.

(Written for the RURAL PRESS by S. C. B.)

Oh, dear, dear! Vacation's over.
I to school this morn discover
A motley crowd of merry faces,
Shouting, laughing, running races.
Listen to their merry voices!
As they see me nearer coming,
All their shouting's changed to humming,
Gathering in from every quarter
To their lines for lunch or water.
I ring the bell, resume my chair,
And, assuming serious air,
Tap, and frown the tumult dormant,
Only to commence the torment.
Thus engaged, time is not dull,
As you would think; indeed, 'tis full
Of odd variety. Attend me then!
"The class may write this specimen:
Now, James, be quick; what is this? Say.
Answer louder; yes, 'tis 'A.'
Mary is leaning on her book,
And John's forever on the look.
What does *this* spell? Why, can't you see
These little letters? R, a, b?
Don't know? Well, that will never do.
Pronounce it *Rab*; enough this time, and you
May take your seat. And Lizzie read,
Stand straight to line; now then, proceed.
Speak louder, slower, higher key."
"Say, teacher, Charlie's pinching me."
"Come here, sir; what's *this* you're into?"
"Boo, hoo! boo, hoo! I didn't mean to."
"Excuse you, sir? Go wash your face.
Next read. Aha! You've lost your place.
Oh, such a noise! Stand here, Ben;
Mary says she's lost her pen.
May I go out? (Ben's broke his slate.)
Jennie, dear, why are you late?"
A busier life, what can exceed it?
"Twas only wasting time to heed it;
But, in the noise and great emergency,
I cry out "Silence!" to these insurgents.
"Right face," with all contrariety,
"Hands up, and promise more sobriety,
Then I'll not undertake to tell
How many of you have failed to *spell*
And come far short of lessons, true,
You bring more care than e'er I knew."
Now, 'tis a fact, that which I hear,
And proverb old—the *truth*, I fear,
Namely, that "she who keeps a school
For twenty years becomes a fool."
A crank, old maid, if really be,
I wonder what'll become of me,
For "zo's" very near, I know,
In which I've had to undergo
Schoolma'am pleasures and vexations
Attaching to the teacher's station;
And if I chance to still continue
Strong in body, mind and sinew,
I'll reason—just by rules of logic—
That by some hopeful chance or project
My longed "ideal" comes this way;
Rich, romantic, young or gay,
(But not a teacher, poet, fool)
Then I'll resign my place in school,
No more to worry, scold or preach,
Lecture, theorize or teach;
But set my cap for him, you see,
And I'll love him—if he'll love me.

Joaquin Miller's Open Letters.

NUMBER 2.

To the Young Man Who Goes Into the Country With a Gun.

The hunting season is suddenly upon us, and the tawny and lion-like old hills of California are swarming with gay and handsome young men in striped clothes and hunting jackets. Each gay and handsome young man from the city has a gun on his shoulder and an empty bag at his side. Each gay and handsome young hunter from the pent-up city is full of life and in high spirits. True, he does not always know which end of his gun is loaded. True, he could not half the time hit the side of a red barn; but this does not necessarily make this gay and handsome young egotist from town a bad man at heart at all. Indeed, I am frank to concede that he is, as a rule, when clothed in his right mind and behind his counter at home, a very good fellow. But that he is a rank fool when in the country, and has a good many things to learn, I think I can very easily show.

In the first place, the air of superiority which the young Nimrod with the new and ever-empty bag, and gun that is guiltless of bloodshed assumes toward his elders and his betters out in the country, shows a mighty weak spot in the brain of this ambitious young hunter. Yet a full admission of his ignorance would at once go far to absolve him with the high priests of the hills and open the closed doors of many a Druid's temple of bird-peopled oaks. Confess his ignor-

ance? Not he! When a young man from the country goes to town for a day he does not assume at once to know all the mysteries and haunts of the place. And yet how much more mysterious are the paths and ways along the wooded hills with nature. That little dot on the map, the city, which you can cover with the head of a pin, and where the young man with the gun makes his home, is a very contemptible place, indeed, comparatively. Yet from his airs and his estimation of it, or rather of himself, you would think his pent-up little town was the entire universe.

And yet it is not quite his mistaken estimation of either himself or his place of abode that makes the young man with a gun so entirely despised by the world-builders out on the golden downs in the hunting season. But frankly, to come right to the point, it is his abominably bad manners when he has left off his Sunday clothes.

These gay young men usually hunt in couples or threes. They even go in herds or bands from three to ten, and their insolence and bad behavior on such occasions can be graded by their numbers, so that I am afraid we will have to argue from this that the gay young man with a gun is not only a booby when in the country but a downright bully and a coward.

For example, four of these young zebras with striped clothes and brand new guns and big, new game-bags, came up here to my steep and stony country place from San Francisco yesterday and took possession at once. They neither knew nor cared who owned the grounds and had inclosed pleasant woods and all the year through had cherished the pretty birds with casque and helmet. They were from the city and they cared not a fig for the country or the countryman.

These clumsy young animals soon began to blaze away at the birds as they stumbled up and down the steep and wooded hills, and seemed to be having a high old time right under my nose without ever saying as much as by your leave. I said nothing, however, to all that, for it soon became clear that the birds were safe. Only the young zebras themselves, and my big redwoods, seemed to stand the slightest chance of being hit. At last the long walk, the steep hills and the fervid September sun seemed to have quite overcome the gay young Nimrods, and after making noise enough to have insured the arrest of every one of them, if at home, they sat down by my spring a little distance above the house, and drew out their flasks. After exhausting two bottles of provisions one of them arose, laid his hat aside on a bench and deliberately washed his face in my flowing spring. The others then did the same. I said nothing all this time. But the vulgar and bad behavior of these wealthy and doubtless well educated young men set me to thinking hard things of them, and I was now entirely out of patience. Suddenly one of them sat down close up to the deep clear pool, took off his shoes and in a moment more had his feet dangling up to the knees in my spring.

"Look here, young man, that water flows down the hill into my house."

"Yes, yes, old man, water generally does flow down hill." The gay young gentleman from the city dangled his dirty feet in the pleasant pool as he said this, and nodded his head at his companions.

There was a shout of delight and much merry laughter from the four young sportsmen, and then the three others began to untie their shoes.

"Will you get out of my spring?"

"Will you bag your head?" answered one.

"Wipe off your chin," yelled another.

"Oh, pull down your vest," sneered a third.

I went in and brought out my little 22-caliber Winchester rifle. The four young men rose up hastily, gathered up their guns and started over the brow of the hill. One of them had his shoes in his hand. The stones are sharp and the hill is steep at that point, but the young man with his shoes in his hand and breeches rolled up to the knee made very good time all the same. As they were about to disappear over the hill I fired at a stone far below them and sent a flattened ball screaming through the air above their heads. That is all. I have two new game-bags and a pair of shoes but little worn hanging up in my woodshed, which any one of these four young men may have by calling at the house a little below the spring wherein they attempted to wash their big, clumsy feet.

I must beg pardon for giving all these dull details of this unpleasant event, but I wanted to set this down exactly as it happened, and I assert that it is only a fair example of the rudeness and audacity of the average young man with a gun who goes out from the city. To say that these young

hunters will steal would be also strictly within the truth. They sometimes camp out, and then they pillage henroosts in search of the game which their untrained conceit cannot bring down with a gun.

Briefly and frankly I assert that if I should go to any city and behave with half the rudeness of the average man coming out into the country, young or old, in the hunting season, or out of it, I should be in jail in half an hour.

Let me say once for all that a man contemplating a trip into the country, could not do better than take a supply of good manners with him. I fail to find any good reason for his leaving them behind him in the city. Decent behavior, indeed, is about as important as a game-bag in an excursion at this season of the year, or any season of the year. Lift your hat, my young friend, when you approach the country and the abodes of the country people. You are coming to the abiding-places, and the birth-places, too, of the kings of thought, for all men of history were born in the country. Why, you poor little pigmy from town, you are among giants when out from behind your counter and out in the country. Lift your hat, I say!

And now, my young hunter from the city, one word more. Suppose you go hunting without a gun. Let me advise you in all sincerity to do this. Let me implore you to do this. More than that, let me frankly confess that I owe all that I am or hope yet to be to the fortunate habit of hunting without a gun.

My home is, ever has been, and must to the end of life be, in the woods. But I don't want a gun on my shoulder all the time. There are no wild beasts, no wild men, if we except those from the city; nothing at all that I could not vanquish with a pebble. Let me tell you how I happily first came to hunt without a gun. Nearly 30 years ago, when among the Indians, I was once out hunting alone. I had grown very weary and sat on a log in the dense woods by a deer trail to rest. I must have been thinking of something far away, for suddenly I saw three deer, two large ones and a fawn, standing not 10 feet distant and looking me full in the face; and there was such a kindly, curious, human look, such an equal homelike look, as if to say that we all lived there together in that lofty world and must not quarrel, that I let my gun lie across my lap till they passed on, and so went back to my Indians empty-handed.

May I digress a bit and add that when I told the Indians, that night, what had happened, they were greatly pleased and said I had seen the spirits of good Indians, and that they would guard me well?

To get back to the text, I tell you frankly and truly that I never really saw anything at all for all my hunting so long as I hunted with a gun.

Yes, I know there is an old saying of mountaineers, that you see everything when you don't have a gun. But I mean more than that; vastly more. I mean that I never really saw the sky, the woods, the waters, nothing so long as I carried a gun and cared only to kill. Candidly, I never saw color, form, space, God, so long as I carried a gun or sought to kill my companions in "God's first temples."

My young friend with the gun, go forth into the tawny hills of gold that slope to our seas with peace in your heart. Truly this hunting in our hills with a gun is not a gentleman's pursuit. It is a pagan's employment. Leave this hunting of the few startled deer to the "hoodlum" who has murder in his heart. For 50 cents you can buy more meat and better meat in the nearest market than you can find in a hard week's hunt in the hills. Give it up. Look into the kindly eyes of the first deer you see from this date and strike a covenant of peace with this helpless and hunted creature. In short, be a gentleman, and a gentleman you cannot be and carry a gun from town to country, if I am to judge from what I have already seen this hunting season.

My young friend from town with a gun, have you ever seen a tree? You never have seen a tree, and you never will see a tree so long as you lay down your good manners and take up a gun when setting out to see the country.

Why, sir, the humblest tree that grows is a grander, nobler object of admiration than the tallest tower of your town. All the architects of this earth could not build a single tree. Look at it as it stands to the four winds of heaven, tossing its arms gratefully, trustfully, lovingly forth; its every bough a blessing, its every leaf a miracle. Leave your gun in the shop and go forth without it, and for the first time see a tree, nature, God.

Let us read the following lines from that gentlest and truest of all our living poets, John Vance Cheney, who makes his home with

us and who wrote them under the shadow of his own redwoods:

In Primeval Wood.

"This deep, primeval wood—how still!
Lo, Silence here makes all his own;
Vile shapes, with hands upon their lips,
Stand round about his darkened throne.

"The patient pleading of the trees—
How deep it shames the soul's despair!
In supplication moveless, mute,
They keep their attitude of prayer."

JOAQUIN MILLER.

Selfishness in Children and Selfishness in Mothers.

It has been truly said by Miss Sewell, author of an excellent work on education, that "unselfish mothers make selfish children." Commenting on this, another author adds: "This may seem startling, but the truth is, that the mother who is continually giving up her own time, money, strength and pleasure to the gratification of her children, teaches them to expect it always. They learn to be more importunate in their demands and to expect more and more. If the mother wears an old dress that the daughter may wear a new one, if she work that her daughter may play, she is helping to make her vain, selfish and ignorant, and very likely she will be ungrateful and disrespectful. And this is equally true of the husband and other members of the family. Unselfish wives make selfish husbands."

On the other hand, a few words may be said on the subject of selfishness of mothers in relation to their children, a form of selfishness very natural and pardonable when not carried to extremes, but which when carried to extremes is apt to be ludicrous and disagreeable. There is no picture on earth more lovely than a young mother and her first babe, and no solicitude so touching, sweet and natural as that which seeks to call your attention to every smile and expression, every movement, one might say, of the lovely innocent who rightfully claims her highest admiration and tenderest love. No one can help sharing in this admiration in degree, neither can one help sympathizing with the sweet solicitude that seeks to make baby the chief center of attraction in the house; but there comes a time and a place where the line must be drawn, and baby's reign become a limited monarchy, and that is when baby is old enough to begin to understand his power; just there he must be shorn of some of the privileges of royalty, if not of all, and later on of all becoming subject instead of king, otherwise there will reign in the house an absolute despot.

At this point, therefore, it behooves a mother to beware of selfishness in the matter of claiming from every person who comes near her child the same admiration and sympathy, also the same allowance that was freely given when baby was at a more tender age, and gave no evidence of the coming possible tyrant. A volume might be written on this subject, but at present there is space only to warn mothers against the fatal error of allowing baby, after a certain age, to maintain through her own agency a tyrannic reign over not only the whole household proper but the "stranger within its gates."—*Aunt Ruth in Prairie Farmer.*

Mother's Way.

The following hint to mothers, clipped from an exchange, we think will be appreciated by all who have once needed to know "mother's way" themselves.

Has it ever occurred to you that you may some day be suddenly prostrated by sickness, or called from home and leave a young and inexperienced daughter to do the family cooking alone? Might she not be sorely puzzled to prepare some of the simplest dishes without mother there to help her? In such emergencies a girl, even if she has time to look for a cooking recipe, can hardly ever find just what she wants, or if she does find it, the recipe is often too elaborate for a beginner's uses. What she needs to know is the easiest and simplest way of cooking plain, every-day food. She may have seen much cooking done, and possibly may have done some herself, but in her perplexity she is apt to forget just how to go to work. To meet such an emergency which is liable to come to the home where least expected, I have a good blank book with a title written across the first page "Mother's Way." In it I write from time to time my own methods of cooking the food commonly used in our family, giving minute directions as to the time required, amount of water used, if any, how much salt and when to put it in, how to prepare

seasoning for each dish, and when to add it; the heat of the oven required for biscuits, pies, bread, etc. I try to write down everything that I think a young, inexperienced girl would be likely to ask her mother about, were the mother unable to go into the kitchen. In as plain and practical way as possible, I add any needed suggestions that occur to me. In short, I try to write just as if I were talking to her. I shall not expect her to get all her instructions in cooking from this book, for when I am with her she naturally depends in a great measure upon me, and when left alone she would find she had forgotten much she needed to know. I feel sure she will appreciate her recipe book, and the mother's care and love that prompted it.

To Make a Happy Home.

1. Learn to govern yourselves and to be gentle and patient.
2. Guard your tempers, especially in seasons of ill-health, irritation and trouble, and soften them by prayers and a sense of your own shortcomings and errors.
3. Never speak or act in anger until you have prayed over your words or acts and concluded that Christ would have done so in your place.
4. Remember that, valuable as is the gift of speech, silence is often more valuable.
5. Do not expect too much from others, but remember that all have an evil nature whose development we must expect, and that we should forbear and forgive, as we often desire forbearance and forgiveness ourselves.
6. Never retort a sharp or angry word. It is the second word that makes the quarrel.
7. Beware of the first disagreement.
8. Learn to speak in a gentle tone of voice.
9. Learn to say kind and pleasant things whenever opportunity offers.
10. Study the characters of each, and sympathize with all in their troubles, however small.
11. Do not neglect little things if they can affect the comfort of others in the smallest degree.
12. Avoid moods and pets and fits of sulkiness.
13. Learn to deny yourself and prefer others.
14. Beware of meddlers and tale-bearers.
15. Never charge a bad motive if a good one is conceivable.
16. Be gentle and firm with children.
17. Do not allow your children to be away from home at night without knowing where they are.
18. Do not allow them to go where they please on the Sabbath.
19. Do not furnish them with much spending money.—*Intelligencer.*

REIGN OF THE WOMAN.—Man never appreciates his inferiority to woman so thoroughly as when he stands before the altar in the presence of an audience of friends and hears the clergyman make him husband. Nine out of ten men in such a position tremble as if they were about to be arrested for murder, while nine out of ten women go through the ceremony as gracefully as if it was an every-day occurrence. And it is this timorous creature in a dress suit that promises to protect the calm and placid angel whose orange-blossoms are her aureole. What delicious sarcasm there is in the thought! And in after life, when the husband gets torn up by care, and when a little trouble comes to steal away his peace of mind, how is it then? The woman whom he promises to protect becomes his protector. She smooths out the wrinkled brow of care. She props up his flagging spirits. She puts new life into his bosom, new hope into his soul, and he goes forth in the morning with new strength and new zeal to wrestle with life and its responsibilities. Woman may be the weaker vessel, but she isn't broken up and doesn't go to pieces as soon as man. *Baltimore American.*

BRIGGS—Tompkins has been talking about you.
"He has? The idiotic old liar! What did he say?"
"Why, he said you were the best looking man in the block."
"Wh—O, I see! Well, you know Mr. Tompkins was always conceded to have a great deal of taste."—*Judge.*

MCRIELLY—I can't make out your friend Bowser. Yesterday I read him an original poem of 30 stanzas, and at its conclusion he walked away without a word of comment. Bagley (enthusiastically)—That's just like Bowser. He's the most forgiving man I ever knew.—*Phila. Call.*

YOUNG FOLKS' COLUMN.

To Adele.

(Written for the RURAL PRESS by MARTHA T. TYLER.)

Little primrose in the spring
Lifted dainty golden head;
"How can you, a fragile thing,
Brave the stormy March?" I said,
Primrose answered: "Do you fear?
Let the naughty wind blow on!
Though the sullen sky is drear,
I've a message from the sun."

So with you, my flower of spring,
Bright and dainty little one;
Let the promise that you bring
Be of summer and the sun.
Fate is often cold and harsh
To the people that we meet;
But wherever you find March,
Be a primrose-blessing, sweet.

Teddy's Book.

Something about it struck Teddy very forcibly. I am not sure whether it was the text itself or the minister's reading it the second time in a very earnest manner. He was a new minister and was preaching to the children this morning.

His text was: "And another book was opened, which is the book of life," and, as I say, he read it over twice.

"The book of life; the book of each one of our lives; do you ever think of that book, children, and what you are writing in it? Every morning you start with a fresh page, and at night what do you find written there—temptations met and overcome, kind words spoken, little acts of helpfulness performed? Or is it a record of temptations yielded to, cross and fretful words, and no kind actions? Think of it, children, when you are tempted to do what is wrong, that it will be written in your book of life, and at that last great day it will be opened and read."

Teddy sat at the end of the seat that Sunday, and was just wondering if he could possibly snap an appleseed—he had some in his pocket—at Joe Peters without Sadie's seeing it, when, as I said, something, either in the text itself, or the reading of it, caught his attention. It was such a thoroughly new idea, he writing a book—one that would be opened and read on that awful day. On the whole, he did not like the idea—certainly not if everything was put in, was his decision, as he recalled some of the many things he had done "just for fun." Then he tried to think of something he had done during the past week that he should like to see in his book; but he failed to recall anything, unless it was that he carried poor Mrs. Kent a basket of apples. "Wouldn't 'a done it, though, only mamma made me," he was obliged to confess to himself just as he had decided that that was quite a meritorious deed. "I say, mother," he asked, anxiously, when he reached home at noon, "the minister said God puts everything we do down in a book; do you b'lieve He does? Maybe He don't see everything, you know."

"Oh, yes, He does, Teddy—every single thing. We cannot hide even our thoughts from God. So we should be very, very careful, even of them," replied mamma, smoothing his rumpled curls lovingly.

"Well, then, I guess folks forget about it; don't they? Or else maybe they don't know."
"I think we all forget sometimes, Teddy; but mamma wants her little son to remember that God sees him always wherever he goes or whatever he does; will you?"

"I'll try," said Teddy, with an unusually grave look in his brown eyes.

Just then the dinner-bell rang. Teddy went downstairs, and, being very hungry, forgot all about the sermon, his book and all, until the next afternoon in the spelling class at school.

Now, Teddy did not like spelling. In fact, he was not overfond of study of any description, but spelling was his particular aversion. He almost invariably failed, and this very afternoon Miss Westwood made a rule that all who failed must remain half an hour after school. Teddy heard it in dismay. It was splendid skating down on the river—the first they had had this winter—and they were all going down directly from school. For once he was utterly oblivious of everything around him; he never lifted his eyes from his book after Miss Westwood said that, until the class was called.

But it was all in vain; the very first word that came to him was "believe," and he could not remember whether it was "ei" or "ie." He hesitated, grew red in the face, and was just going to say "leave," when Miss Westwood was called to the door.

"Ahem!" said some one softly.

Teddy looked around, and there was Will Adams holding up his slate with "ie" in great, big letters on it.

Teddy felt as though a mountain was lifted off his shoulders, for he was quite sure of the rest of the lesson. Then it was that he remembered yesterday's sermon, and his promise. Suppose he were to spell the word as Will had written it for him, which was not the way he would have spelled it himself, how would it look in that book? But then to think of having to stay in. What should he do? It seemed to him that it was all of half an hour before

Miss Westwood closed the door and resumed the lesson, though it was really but a few moments.

"Well, Teddy, how is it?" she said.
Teddy felt positive that every one in the room must hear his heart beat, it thumped away so loudly.

"B-e-l-i-e-v-e." What should he say?
"God sees us always; whatever we do is written down in our book of life. Remember that, children, when you are tempted to do wrong; think how it will look in your book."
"Eive," he said, hurriedly.

Will Adams looked up in blank astonishment. "Couldn't you read it on my slate?" he asked after school.

"Yes," replied Teddy, coloring; "but you see I—didn't want to write a cheat in my book."

GOOD HEALTH.

FOR POISON OAK.—The *Popular Science News* gives the following remedy. I have always been so susceptible to the poison of ivy and oak as to give me great annoyance, unless it is immediately checked on its first appearance. This common washing soda accomplishes for me, if properly applied. I make the application by saturating a slice of loaf bread with water, then cover one surface with soda, and apply to the eruption, the soda next to the flesh. When the bread is dried by the animal heat, I drop the water on the outer side, so as to keep it thoroughly moistened, and dissolve the crystal soda in contact with the skin. This, you will perceive, is merely a bread poultice, the bread being a vehicle through whose moisture the soda reaches the humor. I find that the washing or bathing with soda water, even continuously, will not suffice with me. My skin requires the heat and moisture of the bread in order for the soda to act on and neutralize the poison. I rarely have need to retain this soda poultice for more than 30 minutes on any affected part. No pain ensues. Formerly I suffered often for weeks, as the poison would spread all over my body. Now 30 minutes measure the duration of its existence.

HEALING DISEASE BY PHYSICAL CONTACT.—There is no question, but that there are numerous persons so generously endowed with vitalizing fluid as to be capable of alleviating pain and healing disease by physical contact, who have no conception of it themselves. We have been made acquainted with a number of instances of cure by such healers without contiguity or manipulation of any sort, their mere presence being sufficient to effect that object. This is particularly the case in respect to the lighter forms of nervous troubles. The presence of such persons in the sick chamber is of itself a healing balm to the afflicted, who is able to feel the vitalizing force though ignorant of its source. On the other hand there are persons whose presence at the bedside of a sufferer only adds to his suffering. Hence it is that the family physician, of all others, should be naturally refined and sympathetic, at once capable of comprehending not alone the physical but also the mental or spiritual wants of his patients, and in a manner, ministering to them out of his abundant sympathy and good cheer.

FOREBODINGS IN DISEASE.—In the *Asclepiad*, Dr. B. W. Richardson writes that there are two kinds of foreboding—the fanciful and the serious. False forebodings are presented by persons of flighty or fanciful natures, who are really fond of contemplating risks, and who suggest anxieties one minute but laugh at them a few minutes later. These forebodings have no serious importance. True or serious emanate from persons who are thoughtful and firm, who, as a rule, keep to themselves what is on their minds until something like a crisis has been arrived at, when they come to a conclusion to which they adhere and by which they are greatly influenced. These forebodings in a critical disease are bad; they have a direct effect upon the physical powers, the heart's action is impaired, the digestion becomes affected, and there is a want of tone very much opposed to restorative efforts. It is a wise plan to take as little notice of these forebodings as possible, but to ridicule them is bad.

MENDING SEVERED FINGERS.—Numerous instances have been recorded of late in the medical journals of the complete reunion of portions of fingers which had been cut off from the hand, in some cases by the knife and in others by the ax. In one case a man, in cutting kindlings for the morning's fire, accidentally cut off the end of his thumb. He had gone from the place some 20 feet when he returned, picked up the end, wiped it and replaced it, binding it in its original place as nearly as possible. The wound united, and the finger is now as good as ever, save that its sensibility is somewhat diminished. In another case a boy chopped off the ends of three fingers. He was seen by a physician three or four hours after the accident. The ends of the fingers had been found in the snow, and were brought to him. He attached them, and two of the three united.

AN ANTISEPTIC MOUTH WASH.—One of the greatest living authorities upon buccal bacteriology, Dr. Miller, finds that by using the following mixture he could completely sterilize the mouth, cavities in carious teeth, etc.: Thymol, four grains; benzoic acid, 45 grains; tincture of eucalyptus, 3½ fluid drachms; water, 25 fluid

ounces. The mouth is to be well rinsed with this mixture, especially before going to bed. For retail, a mixture of water and spirits is required for a presentable preparation, and it should be made much stronger, say five ounces instead of 25 ounces, and diluted when required.

DOMESTIC ECONOMY.

FRUIT CAKE.—The yolks of ten eggs, ten ounces butter, one pound sugar, one pound flour, one pound citron, one pound raisins, two pounds currants, one teaspoonful cinnamon, cloves, mace, nutmeg.

COTTAGE PUDDING.—One cup of sugar, one egg, one cup of sweet milk, three tablespoonfuls of melted butter, one tablespoonful of baking powder, 2½ cups of flour. Bake about 40 minutes. Eat with sauce while warm.

GINGER SNAPS.—Boil slowly for 15 minutes two cups of molasses; add one-half cup of butter, cool and add two spoonfuls of cold water, one heaping teaspoonful of soda, one teaspoonful of ginger and flour to roll.

BLACKBERRY JAM.—Take four pounds of fruit, put into a kettle with two pounds of good coarse sugar, and set over a slow fire, gently boiling it for one hour, occasionally stirring it to prevent burning. When done, put in jars and seal.

GOOD CAKE.—One cup each of butter, brown sugar, molasses and coffee, one teaspoonful each, even full, of cinnamon, cloves and nutmeg grated, three teaspoonfuls of soda dissolved in the coffee, flour to make stiff dough; add the last thing two cups of raisins chopped. Bake in a moderate oven.

FRIED ONIONS.—Have frying-pan hot, put in a good sized piece of butter (or meat fryings after frying meat), put in onions sliced; sprinkle with pepper and salt and pour in just a little hot water, cover closely, let cook 20 minutes; add a teaspoonful of flour in a little milk and when it boils it is ready to serve.

SPONGE JELLY ROLL.—Four eggs, 1½ cups of sugar, one tablespoonful of baking powder; beat the whites separately, and the sugar and yolks together till very light; then add part of the whites, then a cup of flour, then beat good, then a little more flour, then the rest of the whites, and stir easy, put it in and bake. Spread and roll as quick as you can.

DELICIOUS PUDDING.—Two eggs and their weight in butter, sugar and flour. Have the butter soft and mix it with the sugar. Beat the whites and yolks of the eggs separately, and mix with the butter and sugar; add the grated peel of half a lemon, and stir in the sifted flour. Pour into a buttered pan, filling a little over half full, and bake in a moderate oven.

TAPIOCA CREAM.—Soak one-half cup of pearl tapioca in water over night, put a quart of milk in a saucepan to heat, beat the yolks of three eggs and two-thirds cup of sugar with the tapioca. When the milk is hot, stir in and boil two minutes, stirring constantly. Set on the ice, and just before serving beat in the whites of three eggs beaten stiff, and season with lemon and vanilla.

APPLE MARMALADE.—Take nice sound russet apples, pare and core, cut in small pieces, and to every pound of fruit add one pound of sugar; put the sugar to boil, with just enough water to dissolve it, into a preserving kettle, add one large lemon to every four pounds of fruit, boil all together until the syrup gets thick, then add the apple and boil until it looks clear. This is well made half quince and half apple.

ICE CREAM CAKE.—Take the whites of eight eggs, beat to a stiff froth, two cups sugar, one cup butter, one cup sweet milk, two cups flour, one cup corn-starch, two teaspoonfuls baking powder. Cream the butter and sugar, sift flour, corn-starch and baking powder, add the beaten whites of the eggs last. Bake in jelly tins. For the icing: Boil four cups sugar until it will candy, and pour over the beaten whites of four eggs, and add one teaspoonful pulverized citric acid. Stir until cold and spread between layers.

FOR THE LADIES.—Flannel that has grown yellow by repeated washing will whiten considerably if left out of doors on a cold night. The useful chamois skin is easily cleansed. Rub until it plenty of soft soap, then lay it for a couple of hours in a weak but warm solution of soda water, rub until it is quite clean, and rinse in warm water in which soda and hard soap have been dissolved. Dry in a rough towel, then pull into shape and brush. With the mercury at zero, mittens are very desirable articles when hanging clothes, and making them as a lady has suggested certainly will not lighten the purse. Cut the desired length from the legs of worn wool hose, sew across one end and piece in for thumbs. To prevent shrinkage in flannels, use quite warm soft water for washing. Make a suds of soft soap, or shaved bar soap, and turn the garments before wetting them. Squeeze rather than rub out the dirt, rinse in plenty of warm water, and dry quickly. If they are smoothed with an iron, let it be done on the wrong side. "Helen Dorcas" gives the following direction for making washing easy: "Put four pails of soft water in the boiler and add one-half cake of common soap, or three cups of soft soap, and three tablespoonfuls of kerosene; heat, and put in the dirty clothes, boil 20 minutes, take out and rub in one water, rinse and hang out."

The Week.

Approaching winter is sending skirmishers throughout the land. Just after the RURAL went to press last week there were showers which extended over quite an area of the State, catching rains in the San Joaquin valley, staining Lima beans in San Luis Obispo and doing some injury to other exposed products elsewhere; but there was not water enough to work any great harm to fruit on trees or vines. It was an angry storm in some places, marked by flash and roar which are not common in California. Early frosts, too, have touched some of the coast valleys; they have been sporting about some time in the mountain districts. It would not be surprising to have a heavy rainfall this year and it will certainly be welcome, for last winter gave us but small figures.

The rain has seriously vexed the California veterans who went last week with their best raiment and finest fruits to bear the standard of the West at the Grand Army assemblage in St. Louis. It is hard to manage an affair of such kind with leaky skies and muddy pavements. Californians will return more pleased than ever with their home-State.

The Mechanics' Fair is proceeding in most excellent style. The fruit exhibit is constantly renewed, and other products are increasing in amount. There are now about 15 counties represented and the main building and the an-

nexes are full to overflowing. There never was a greater display of industrial products in California.

A Dairy Sensation.

It clearly appears that the Dairy Commissioner of Oregon is using his office for purposes not designed by the law creating it. We are fair enough to believe that he is thus doing through misapprehension of facts, and that he has been misled by chemists to whom he has intrusted the examination of butter. For some time there has been trouble made for Portland merchants selling California butter by charges and indictments based upon the allegation that they were receiving from this State and selling in that market California butter which was composed in part of oleomargarine, lard or other substances not found in pure butter. Some months ago a Portland merchant was charged with such operation, and a sample of the butter alleged to be adulterated was sent to the California State University for analysis. A most thorough examination was made by Mr. August Harding, a well-known and competent chemist, and his testimony was sent to Portland, and if we remember correctly the grand jury killed the indictment upon Mr. Harding's statement. It did wisely, because there is no doubt whatever that the butter analyzed by Mr. Harding was pure in every respect.

Now it appears that the dairy commissioner has had other analyses of California butter made by local chemists, and upon their testimony has had a number of Portland merchants arrested, and desires to push the cases forward to conviction upon this evidence alone. These merchants have secured a postponement until they can have the butter examined by competent chemists, and then they will rest their case upon the results of such analysis. We understood that Thomas Price of this city, and August Harding of Berkeley, now have samples under examination. The samples were sent from Portland under seal, and in a few days probably one or both of the chemists named will go to Portland to testify in the case.

Naturally this issue has created considerable excitement among the dealers in Portland and San Francisco, for the charge is a serious one to them, and there is excitement also among the California butter-makers who are thus charged with adulterating their product. It is a very unfortunate affair, and if the examination results as may be anticipated, the dairy commissioner of Oregon may have to face not a little opposition for allowing himself to proceed upon untrustworthy evidence.

The analyses now in progress will of course be the ultimate test in the affair, and the makers of the butter and the dealers in San Francisco are well content to trust their case to competent chemists, because they know the butter is pure. Aside from this, there are many considerations which place the purity of the butter beyond question. First, there is no oleomargarine made here that we ourselves are morally certain of, and we have given the subject constant attention. Second, there is no false butter brought here for sale. The U. S. revenue officials now have that matter in charge, and are men who are experts at unearthing moonlight whisky and capturing smuggled opium and doing the most obscure kind of a detective business generally. It is not possible for oleomargarine to be made and shipped without detection. On this subject the following letter is of interest:

U. S. INTERNAL REVENUE, DEPUTY
COLLECTOR'S OFFICE, FIRST DIST. CAL.,
SAN FRANCISCO, June 14, 1887.

Hon. H. L. Dodge, Pres. S. F. Dairy and Produce Exchange.—DEAR SIR:—Your favor of June 11th in regard to oleomargarine, etc., has been received. In reply I would state that the internal revenue agent and my deputies have heretofore made diligent search for oleomargarine, but so far have not succeeded in finding any offered for sale in this district. There are no manufacturers of the said article in this city or district that we have discovered; and no stamps or licenses for the manufacture or sale of any such article have been issued. I will further state that all manufacturers of oleomargarine must report all sales to the commissioner of internal revenue, who in turn notifies every collector of internal revenue of each district, to whom such sales were made and the oleomargarine, etc., sent. So far there has been only two lots shipped into the first district of California, and that for consumption by the purchasers. Respectfully,
ASA ELLIS, Collector.

This letter shows that the revenue officials of the districts where the bogus butter is made inform the officials of districts to which it is

shipped, and thus the stuff is traced and all officers are warned of its progress. This statement of affairs bears out exactly what we know of our own knowledge.

Another moral consideration which carries much weight in our own case is the fact that the dealers in this city who made the shipments to Portland are among those who have been longest and best known for their connection with the legitimate dairy interest of this State. They were foremost in giving their time and money to secure the passage of the California law against oleomargarine, which has been the model upon which most of the State enactments have been shaped. They have been the leading foes of adulterated products for years. They fought and hedged about the factory, which was started in this city some years ago, until it was closed up and its machinery sold to the soapmen—a very proper fate for it. It would take pretty positive evidence to convince us that such men, after what we have personally known of their actions for years, have at this late date gone into debasing butter, thus endangering their reputation and business prospects and interests. We know them too well to consider them at all likely to be such fools.

It is not thinkable that California dairymen are debasing their own butter. They haven't the means of doing it nor the material to do it with, leaving out of all consideration their known honesty and zeal in securing a good reputation for their product. If Oregon needs more butter than is made at home, California butter will naturally seek a market there, and our producers are entitled to the trade. The Portland papers clearly intimate that their Dairy Commissioner is endeavoring to sacrifice consumers' interests by raising a hue and cry against California butter so that the price of the Oregon product may be enhanced. It seems hardly necessary to make such a charge, because a man may be misled by incompetent analysts into fighting a genuine product. This, it seems to us, is the most natural view to take of the affair.

The effort to secure correct analyses of the suspected material, and of sending the analyst to Portland to sustain the character of the California product, is assumed by the San Francisco Dairy and Produce Exchange. At their meeting in this city, Sept. 27th, it was resolved to assist in the defense of the Portland merchants, and to that end furnish all such evidence as might be required to establish the genuineness of the article sent. A committee of five, consisting of Messrs. Hegler, Whitney, Van Sycklin, Brigham and Feusier, were appointed to take charge of the matter.

We shall keep our readers informed of the future course of the unfortunate affair.

THE STATE BOARD OF TRADE.—This organization has secured permanent headquarters at No. 12 Second street, under the Grand hotel, close to Market street, and therefore a very desirable and accessible situation. Two floors and the basement will be occupied. The first floor will be given to permanent exhibits from the different counties. On the ground floor will be the office of the board, where information will be afforded by J. M. Davies, the Secretary, regarding any part of the State, and the visitor to the place will have the advantage of knowing that there are no private interests to serve and that the information afforded is not given with the idea of finding a possible purchaser of land. The basement of the building is to be used as a store and receiving house. The premises will be quite ready by the end of this week and already strangers are availing themselves of the opportunities afforded them, and the board is issuing circulars on all the incoming overland trains.

STATE BOARD OF HORTICULTURE.—On the 23d ult. the Governor appointed R. B. Blowers of Yolo county a member of the State Board of Horticulture, vice H. C. Wilson of Tehama county, term expired, and also reappointed A. Block of Santa Clara and Elwin Kimball of Alameda for the State at large, and W. M. Williams of Fresno county and Elwood Cooper of Santa Barbara county.

THE contract for completing the Mokelumne Ditch and Irrigation Company's dam near Burson, Calaveras county, has been awarded to Walker & Merwin of Chico, for \$17,072, and work is to be begun immediately.

Angora Goat Registry.

A movement which is interesting because of its novelty, and important because of the possibilities which may be involved in it, is that arranged by the California Angora goat-breeders at their meeting in Sacramento last week, and which is fully reported in another column of this week's PRESS. We speak of it as novel because we understand it is the first actual adoption of provisions for registry by any organization of Angora breeders in this country. Our readers will remember that the Texas goat men proposed a most elaborate system of goat registry last winter, which was fully described in the RURAL, but because of the illness of Mr. Hoerle, who had the practical leadership of the affair, the meeting held in June last for the adoption of the registry was ineffective. The California breeders were solicited to join with the Texans in the establishment of the register, but the failure of the Texans to give their measure final shape, and the fact that the provisions proposed in Texas for the entry of grade goats in lower classes did not meet the views of California growers, opened the way for original and independent action by the Californians, and this they have taken, as the report of their meeting shows.

It will be noticed that the California scheme is much simpler than that proposed in Texas. It seemed to the breeders present at the meeting that all they required was the registry of thoroughbreds. This will serve to preserve the records of descendants from imported goats and enable the breeder to select his stock with some surety. Hitherto there has been no guide except individual statements, and though a man could get almost any other kind of an animal with an authorized pedigree, he was quite at sea on the goat. This fact has prevented some from investment. It is clear, on general principles at least, that the buyer of goats should be able to trace the ancestry of his purchases, and that he can secure the blood of especially fine animals if he desires, as is now possible with every other kind of improved live-stock.

There may be some difference of opinion as to the methods and provisions adopted to secure registry. Such subjects are legitimate subjects for discussion, and our columns are open for contributions of this character. It is true that the Angora industry is a little dull at present because of the low prices for mohair; there is also dullness in the sheepfold. It is probable that the wave of better rewards will return, and no one can tell how soon. Those who will be best prepared to profit by it will be those who have the stock fitted to produce the best article, whether it be wool or hair.

ANOTHER HOP-HOUSE BURNED.—We are losing rather more hop-houses than usual this year. The latest fire was early on the morning of Sept. 27th. The hop-house of L. Ross, in Green valley, Sonoma county, was totally destroyed by fire, with its contents. The origin of the fire is not known, but it was first discovered by Mr. Ross' son, who was walking through the hop-kiln and displacing hops with his feet to ascertain if they were thoroughly cured. It is supposed some one carelessly dropped a bunch of matches, which were tramped upon and ignited. The loss is estimated at \$6500; insurance, \$5000. The suggestion has been made that arrangements should be made to store hops elsewhere than in the building with the kiln. It would seem to be the part of wisdom to arrange other and safer storage-room.

FOOD VALUE OF THE OLIVE.—Frank Kimball of National City thinks that the worth of the olive for food is not generally understood. He lately said to a San Diego Sun reporter: "I have become satisfied that for the man working with a pick and shovel, a pound of pickled olives is worth more than the same weight of the best beef that can be obtained. To obtain the full value of the fruit, it should be ripened on the tree and properly prepared for use after it is gathered. The bottled olives of commerce are pickled green, and their most valuable qualities are lost in their preparation."

TEXAS FEVER.—It is telegraphed from Nebraska that a fresh outbreak of Texas fever has appeared at Tekamah. Dr. Billings of the Veterinary Department says that the native cattle are undoubtedly extending the disease. It has been held heretofore that only Texas cattle could communicate the fever to others.

The State Fair.

The State Fair of 1887 closed on the evening of the 24th after a most successful run of two weeks. Our notes from Sacramento have shown in a general way the character of the exposition in its most striking features. We have other matters to present and the corrected list of awards to lay before our readers as soon as the data is secured.

Of the success of the fair the throngs of people at the pavilion and the park from day to day was evidence. There is also additional testimony in the financial statement which is set forth by the *Record-Union* as follows:

Below is given the comparative totals of daily ticket sales of the State Fair for 1886 and 1887.

Pavilion, 1887.....	\$15,220 00
Pavilion, 1886.....	9,861 25
Excess for 1887.....	\$5,358 75
Park, 1887.....	\$14,395 00
Park, 1886.....	13,339 25
Excess for 1887.....	\$1,055 75

Total excess for 1887.....\$6,414 50

These figures only show receipts for daily admissions. In addition to this, the excess in receipts from privileges, etc., will swell the total excess of receipts from all sources to about \$9000 over those of last year. The total receipts and disbursements of the Society for the current year will not fall short of \$100,000, which shows that it is an institution of some magnitude, and requires more than ordinary business tact and management to successfully handle such a volume of business in so short a period, as two-thirds of this amount is handled during the months of September and October. No safe estimate can now be made upon how much of the indebtedness of the society will be paid, owing to the heavy disbursements necessary for running expenses and premiums, which have not as yet been passed upon. But it is safe to say that a large portion of the \$22,000-note will be cut off, and needed improvements at the Park made.

Improvements at the park are certainly needed. More stock sheds are a necessity, the spaces between the sheds should be well rocked or graveled, and grades set so water will run off and not make the mud-holes which are now to be found here and there. These and other desirable things will, no doubt, be secured.

There is, however, one change which we would suggest as very desirable in the pavilion, and that is to make the machinery halls more thoroughly a part of the pavilion. At present there are only small doors connecting these large apartments with the main floor of the pavilion, and one might wander around all the evening without knowing what an amount and fine selection of agricultural machinery was displayed. If the buildings remain as they now are, there should certainly be large openings, which would enable the visitor to catch glimpses of the machinery from the main floor and the galleries, and thus be drawn to an examination of it. If these openings would admit too much noise they could be glazed over. Our agricultural-implement men made great efforts to present their displays in fine style this year, but they felt all the time that they were away off in a corner, and but few found them. It seems to us this matter could be improved without very great expenditure.

Awards for County Exhibits.

We have already briefly characterized the various county exhibits. They were creditable to all engaged in setting them forth, and they will be of lasting advantage to the counties which, either through public or individual en-

terprise, undertook the work of exhibition.

The following-named gentlemen served as a committee on awards, none of them being residents of the counties which entered in the contest: Governor Waterman of San Bernardino, L. H. McIntosh of Butte, H. W. Seale of Santa Clara, F. C. de Long of Marin, Paris Kilburn of Monterey. They made the following awards: San Joaquin county, first prize of \$500. The remaining \$1500 was awarded as follows: Sacramento, \$300; Placer, \$250; Colusa, \$250; Nevada, \$200; Humboldt, \$150; El Dorado, \$150; Yuba and Sutter, \$100; Solano, \$50; Tehama, \$50.

We alluded briefly last week to the banquet set out by the citizens of Sacramento in honor of the delegates who appeared at the fair in charge of the county exhibits. The idea was a happy one, and such meetings under such meliorating influences must tend toward mollifying the sectional feeling which is unfortunately becoming much too pronounced in this State. This sectional feeling sometimes springs from self-interest, of course, but is chiefly due to the fact that residents of one region do not really know the resources and adaptations of other parts, and thus are easily led to conceit in their own section and misrepresentation of others. Full acquaintance of people with each other

THE SHEEP LICENSE.—The *Inyo Independent* is greatly pleased with the decision of the Supreme Court that the Mono county sheep license is constitutional. It says: "For years past several counties in this State and in Nevada had tried in vain to find some way to make sheep-owners pay something to the counties where their sheep pastured. Much credit is due to the people of Mono county for their perseverance in pushing this matter to a successful issue. It is a high distinction for their attorney, R. S. Miner, Esq., that he should have succeeded where so many had failed to get a decision from the Supreme Court in favor of a law that appears to be a complete remedy for the difficult subject. It is nothing less than justice that where a vast number of sheep are pastured a good part of the year, to the great profit of the owners, they should be made to pay a reasonable part of the local taxation. And under this license law no injustice can be done the migratory herdsman; the permanent dweller in each county will be taxed on sheep the same as transient visitors. Against this the sheepmen can have no just grounds for complaint."

TEXAS AND CALIFORNIA.—The State of Texas comprises a larger area than either France or

Salinas Valley.

The extension of the railroad from Soledad to Santa Barbara, and a probability that when finished to Los Angeles this will be the overland route of the Southern Pacific, has stimulated inquiry in regard to the great Salinas valley, which is 100 miles long and from 5 to 15 miles wide.

The lower portion of this valley was occupied by Mexican settlers in 1800, and grants of land were made by the Mexican Government in 1820. At the time of the American conquest a large proportion of this great valley was covered with grants. It has a very strong, fertile soil and produces rich, succulent grasses, principally burr clover, alfalfa and bunch grass. For stock-raising this valley has always been regarded as one of the best in the State. The climate is equable, neither very warm nor cold, and well watered by perennial springs and the Salinas river that follows a serpentine course the entire length of the valley. For the last 15 years extensive grazing has given way to grain-raising and dairying in this valley. It has been no uncommon event for the traveler to ride continuously in a grain-field for 25 miles, where the stalks would reach on an average to the height of the bug-

gy wheels with patches of mustard from eight to ten feet in height. From Moss Landing at the mouth of the Salinas river to Soledad, there are over 6000 feet of warehouse room 50 feet wide, and the Ball warehouse at Salinas City is 1000 feet in length. At the present time all these warehouses are filled to their utmost capacity.

The first settlers in this valley were of the opinion that this section was only adapted to grazing. The phenomenal success attending growing grain has satisfied the occupants so well that their efforts to utilize this rich virgin soil

VIEW OF PORTION OF WAREHOUSE ONE THOUSAND FEET LONG, SALINAS VALLEY, CAL.

and with the different parts of the State is now greatly needed in order that California may exert a single and undivided influence for her own advancement. The speeches at the banquet indicated that the true feeling was entertained. For example, Mr. L. J. Rose of Los Angeles, among other things, said:

"The fruits of California have a world-wide reputation, and as for brave men and beautiful women, no State in the Union can compare with her. For 27 years I have resided in California, and in all that time there has not been a day nor an hour that I have not felt proud to claim it as my home. When I look about the pavilion and see the immense displays of luscious fruits, elegant productions, beautiful flowers and healthy faces, I need look no further for the cause of the boom. The boom has been earned upon merit and will continue to grow, for, as the Governor has truthfully remarked, there is but one California. I am from the South, but no pent-up Utica finds a place in my breast. There is no part of California that is equal to all the rest. I have a preference for the South; there is my home, but it is only a portion of my adopted State, California. There is no portion of this State which can exclaim: 'We have it all!'"

This sentiment should grow until the narrow and unfortunate sectionalism fades away. Other matters relating to the fair will be presented next week.

THE *Ventura Democrat* says that 1,200,000 bushels of grain will be shipped from Hueneme this year, all produced in that vicinity.

CORN CROP OF 1887.—The *Farmers' Review*, Chicago, estimates this year's corn crop at 13,000,000 bushels.

Germany. Its productive capacity in agriculture is also larger than either of those two great and powerful countries. The entire wheat crop of the United States could be grown on the land in that State, which is in excess of the entire area of Germany. The entire cotton crop of the world could be grown upon only one-seventh part of the entire area of the State of Texas. The possible productive and political power of Texas is equal to that of the present most powerful country of Europe. California is but little if any behind Texas in the possibilities which she may realize during the coming century. In view of the above facts, which may be realized by only two of the States of our Union, who can estimate the possibilities to which the more than 50 States which this Union will soon comprise, may attain?

THE LONG DROUGHT throughout the West has not only seriously affected some branches of trade, but it has also been the cause of unusual damage to property from fires started by sparks from locomotives. Bridges, fences, buildings and grass are as inflammable as tinder. On many of the railroad lines men have to be kept constantly on the watch for fire, constituting an actual fire department.

THE San Luis Obispo *Republican* says: From Judge Leff we learn that a German company will establish a beet-sugar factory in the Santa Maria valley, at a cost of \$200,000. It will be ready by next season, when a large supply of sugar beets will be grown.

have been almost exclusively in this channel. In a small way a few enterprising men have found that this section is one of the most favored in soil and climate for raising fruit of all kinds. Mr. H. Escolle of Monterey has an almond and orange orchard 12 miles from Salinas City. Near Salinas City there are several vineyards and a winery having an excellent reputation. These developments have inaugurated a new era in the valley. Several large land-owners will subdivide their large holdings in small tracts for settlers who wish to raise fruit and build homes. The celebrated Abbott ranch, one of the most noted dairies in the State, has lately been sold with a view of dividing in small tracts. Mr. Michael Lynn, who farmed over 2500 acres in grain this year, has sold his Gabilan ranch of 7665 acres to a syndicate who will subdivide and sell in small parcels. Mr. Hiram Corey, one of the most successful farmers and dairymen in Monterey county, has sold the noted Buena Vista rancho of 7725 acres, which have been surveyed in 60 lots, and a town laid out in the center of this tract.

We herewith give a cut of the Ball warehouse, which is 1000 feet long and 50 feet wide. It is owned by the Salinas Warehouse Association, who have the following additional warehouses: Soledad, 400 feet long; Chualar, 402 feet long; Gonzalez, 500 feet long. Mr. Jesse D. Carr is the President, H. S. Ball, Secretary, and the Salinas bank, Treasurer. The Directors are as follows: J. D. Carr, H. S. Ball, J. K. Alexander, T. F. Faw, H. R. Stephens.

MIGRATION OF ANIMALS.—While animals seem to be concerned only about their own individual welfare, it would seem that they often act in concert over a large tract of country. Thus we hear of frogs leaving in large numbers a pond that is nearly dried up; also of rats suddenly forsaking a ship or farm-house that they have made their home for many years. Precisely how these animals make each other understand that a change is desirable, and how they arrive at a unanimous conclusion, has not been explained. It is reasonable to suppose that they must have a leader, whom they follow through great danger. The past fall there has been a great migration of squirrels from Northwestern Mississippi in the direction of Arkansas. They crossed the Mississippi at various points along a line of 20 miles in length, their march tending westward. They traveled in thousands, and the people along a line of their march killed them with sticks in large numbers. Hunters followed them in their march and slaughtered them by wagon-loads and carried them to the nearest market. These squirrels seem to have lost all fear, and could not be turned from their course. It is said that a smaller migration occurred 13 years ago. It is generally supposed that the migration of squirrels is caused by a lack of the proper kind of food, but how should they know that there is a better supply in another direction, and how should all the squirrels of one vast tract become aware that such a movement is on foot? These migrations suggest that there may be a greater intelligence among the lower animals than is generally supposed.

HOW TO KEEP COOL.—A Nebraska correspondent tells the New York World how to keep cool. When the thermometer runs up to the nineties or one hundred, and people feel as if almost prostrated, if they will mix a quarter of a teaspoonful of pulverized cayenne pepper in half a teaspoonful of milk or sweetened water and drink it, they will find they can stand the heat ever so much better. This raises the internal heat to an equilibrium with the atmosphere, and makes one stronger and more comfortable. It cools one more effectually than iced drinks or stimulants. It has been used in our family for three generations. In case of sunstroke this is a remedy that gives almost instantaneous relief. The prostration experienced on hot days is caused by a preponderance of the external heat over the internal, and the more cold drinks one swallows, the more weakness and lassitude. Cold drink in hot weather should be used very cautiously and in small quantities. Spirituous liquors will stimulate only for transient relief, but pepper holds its own and does not cause thirst afterward.

TREATMENT OF INSECT STINGS.—The stings of insects, such as gnats, mosquitoes, etc., says *Le Pharmacien Populaire*, are often painful. In such a case apply spirits of hartshorn or volatile alkali to the part. Spider bites are not only painful, but often venomous, and it is necessary to wash them with salt water or diluted vinegar. The sting of the bee is harmful only when the sting remains sticking in the wound. So the first thing to be done is to press the wound in order to make it bleed, since the blood that flows will carry along a portion of the poison. Then suck the wound and wash it well with water and then with a solution of kneo powder. This latter, which is much used in England, consists of three parts of chloride of lime to eight of common salt. An ounce of this powder is to be dissolved in a tumbler of water. If this composition is not to be had, Goulard's extract may be used. For the sting of the scorpion, volatile alkali should be used, and after the pain subsides, an emollient cataplasm may be applied.

TREATING WOODS ARTIFICIALLY.—Pine naturally treated is one thing; painted in brown or red and called black walnut, mahogany, or cherry, it is decidedly another. So in hard woods; to show the natural color and to bring out the beautiful grain of the wood is far preferable to any treatment which aims at different results.

Important to Tree Planters.

One hundred and twenty-five thousand Fruit Trees for sale at a bargain, consisting of Apple, Pear, Peach, Apricot, soft and hard-shell Walnuts; also 2000 Fan-Leaf Palms. Sales will be made in lots, or the Nursery and stock will be sold on the most liberal terms as to price and payments, or will be exchanged for real estate. Inquire of J. M. Hixson, Real Estate Agent, 75 N. Spring street, Los Angeles, or address the proprietor, Milton Thomas, P. O. Box 304, Los Angeles, Cal.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

STOCKTON, CAL.

THE GOLDEN GATE PLUG CLOSET.

WITH TRAP.

WITH OFFSET.

This Closet is the Best, Because

1. It has a simple, strong valve, suitable for any pressure, self-closing by a genuine Phosphor Bronze Spring, acting with the pressure. To prevent breaking and weakening of the spring, I have gone to the expense of using Phosphor Bronze Wire, which will have the desired effect.
2. It has a real sanitary overflow, a copper float attached to a bell of the same metal resting on face of the brass overflow pipe, operated by the rising of the water in the closets above its level, thus absolutely preventing any escape of sewer gas, even the closets being without water.
3. It has no dead corner, consequently no foul water will be left in the closet after lifting of the handle. A constant rush out of the floor chambers will keep the closet and trap perfectly clean.

With above stated points, I am able to call my closets the most perfect and cheapest in the market. N. B.—Architects who endeavor to furnish their patrons with the most reliable goods, should not hesitate to give this closet a trial. Send for descriptive catalogue.

JOSEPH BUDDE, Manufacturer, 43 Fremont St., San Francisco.

S. F. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Sept. 28, 1887.

The past week has been more or less a repetition of the preceding weeks. The fine, brilliant weather has done no little in aiding raisin and dried fruit curers; and it now looks as if the pack will exceed former estimates. From Europe and the East daily telegraphic advices gave a steady advancing wheat market. To-day's cables are as follows:

LIVERPOOL, Sept. 28.—Wheat, firm. California spot lots, 5s 1rd to 6s 2d; just shipped, 3s 3d; nearly due, 3s 3d; cargoes off coast and on passage, firmer and held higher; Mark Lane wheat, steady; English and French country markets, firm; wheat on passage to Continent, 253,000 qrs; wheat and flour on passage to U. K., 1,622,000 qrs; wheat and flour in Paris, firm; weather in England, colder.

Crops at the East.

WASHINGTON, Sept. 25.—The following is the weather and crop bulletin issued by the Signal office: During the week ending Sept. 24th the weather has been colder than usual in the districts east of the Mississippi and on the North Pacific Coast. The temperature for the season from Jan. 1st to Sept. 24th was slightly below the normal for Northern New England westward to the North Pacific Coast and in the South Atlantic States. It has been warmer than usual in all other districts. Reports from the greater portion of the winter wheat region show that the work of preparing the ground is being retarded on account of continued drouth. Reports from Tennessee, the Middle Atlantic States and New England show that the weather was favorable for crops, and that the seeding of wheat was in progress. Reports from Kansas, Nebraska and the western portions of Missouri and Iowa indicate that the weather was favorable to growing crops. Killing frosts occurred as far south as Central Illinois, Northern Indiana, Ohio and Michigan during the latter portion of the week.

Eastern Wheat Markets

NEW YORK, Sept. 26.—Wheat closed for Sept. at 80c; Oct., 80½¢; Nov., 80c; Dec., 82½¢; Jan., 84c; May, 88½¢.

NEW YORK, Sept. 28.—12 M.—83½¢@83¾¢ for cash, 81½¢@81¾¢ for Oct., 82½¢@82¾¢ for Nov., 84½¢@84¾¢ for Dec., and 89½¢ for May.

CHICAGO, Sept. 28.—12 M.—71c for cash, 71½¢ for Oct., 72½¢ for Nov. and 73½¢ for Dec.

California Fruit at Chicago.

CHICAGO, Sept. 27.—California dried fruits are firm, especially apricots, which are scarce, with few more to come forward. Peaches sell fairly well, but there are not many here, as it is a little early for them. Some parties say there will not be many, owing to so large a part of the peach crop being taken for canning purposes. New raisins are just beginning to appear and the market has not yet fairly opened. Prices are quotable as follows: Apricots, sun-dried, bleached, choice, 18½¢@18¾¢; apricots, sun-dried, bleached, prime, 16¢@16½¢; apricots, sun-dried, unbleached, 13¢@14¢; peaches, peeled, evaporated, choice, 23½¢@25¢; peaches, peeled, evaporated, good, 20¢@22¢; peaches, unpeeled, evaporated, fancy, 17¢@18¢; peaches, unpeeled, evaporated, choice, 14¢@16¢; peaches, unpeeled, sun-dried, 13½¢@15¢; plums, pitted, new, 13½¢@14¢; raisins, loose Muscatel, old, ½ box, \$1.45@1.50; do, London layers, ½ box, \$1.60@1.65.

California Fruit in New York.

NEW YORK, Sept. 26.—900 bxs of Tokay grapes, which arrived from California in fine order, were sold at auction to-day, bring from \$1.10 to \$1.70 per cri. Considering that large quantities of grapes are being received daily from vineyards near at hand, the prices obtained were excellent.

The Commercial Bulletin says: Messrs. T. H. Leggett & Co. have received samples of Lieb's new crop of San Jose, Cal., prunes. Much to their regret they are unable to offer additional quantities to their customers, as they have already disposed of their entire purchase, and there remains no unsold stock on the Pacific Coast.

Eastern Hop Markets.

CHICAGO, Sept. 26.—Hops continue to rule quiet at former prices, and sales are not important. The offerings are small, for new hops are arriving slowly, which is due to growers asking above what buyers are willing to pay. We quote Pacific's new crop, choice, 20¢@22¢; do medium, 17¢@20¢; Pacific's 1886, choice, 14¢@18¢; Pacific's 1886, medium, 10¢@14¢; Pacific's 1885, 5¢@14¢.

Eastern Wool Markets.

NEW YORK, Sept. 25.—A more hopeful tendency is to be noted in some cases and appears in a measure justified by the large run of orders dealers have secured. Among sales were 20,000 lbs Eastern Oregon at 20¢@23¢; 8,000 lbs do. at 24¢; 40,000 lbs Territory, at 21¢@25¢; 5,000 lbs do. 20c; 28,000 lbs do. at 18c; 20,000 lbs spring California at 19½¢; 14,000 lbs do. at 52¢@52½¢.

In the Philadelphia market the demand for Territory and fine wools, which constitute the bulk of the supply, has continued light and unsatisfactory. Medium fleeces are in small supply and steady but quiet. There is no material change in prices, but the market is weak. Among sales were 30,000 lbs Territory fine, at 15¢; 13,000 lbs Montana medium, at 26¢; 12,000 lbs do. at 25¢; 14,000 lbs Territory improved, at 23¢.

BOSTON, Sept. 27.—Wool dull. Fine Territory scoured, 57¢@59¢; fine medium scoured, 53¢@55¢; coarse do 45¢@50¢; Michigan and Ohio unwashed fleeces, 18¢@25¢. Other grades are unchanged.

NEW YORK, Sept. 27.—Wool is firm. Domestic fleece, 26¢@34¢; pulled, 14¢@33¢; Texas, 9¢@14¢.

Local Markets.

BAGS.—The market is quiet but firm at 7½¢@8¢ for Calcutta.

BARLEY.—Notwithstanding the heavy consumption, large receipts keep the market down. In options on Call, dealings were fair, but at low prices. Owing to the heavy receipts the bears hammer the

market so as to keep values from advancing. At to-day's Call, sales were as follows:

Morning Session: Buyer season—200 tons, \$1.05½; 100, \$1.05½; 400, \$1.06. Buyer 1887—200 tons, 97c. Seller 1887—600 tons, 89½¢@90¢. Seller season—100 tons, 89c @ 90c. Afternoon Session: Buyer season—200 tons, \$1.05½. Buyer 1887—200 tons, 96½¢; 700, 96½¢; 100, 96½¢. Old contract—100, 96½¢. Seller 1887—100 tons, 89½¢. Old contract—600, 90c; 100, 90½¢; 500, 90½¢ @ 91c.

CHEESE.—The market is again higher, under a good demand and stocks well concentrated.

BUTTER.—Hot weather, a lessened demand and an increase in the receipts, caused prices to shade off, and close weak.

EGGS.—Strictly choice fresh laid are wanted at full figures, but off qualities are slow. The supply of the latter, owing to hot weather, is increasing.

FLOUR.—The market is steady, with a stronger tone.

WHEAT.—Sales of actual wheat are few, owing to holders' views being above buyers'. Buyers take all parcels put on the market at our quotations. On Call, trading was more active at gradual advancing prices, owing to an improving market abroad. To-day's sales were as follows:

Morning Session: Spot—100 tons, \$1.30; 100, \$1.28; 100, \$1.28½. Buyer season—400 tons, \$1.48; 400, \$1.47½; 700, \$1.47½; 200, \$1.47½; 300, \$1.47½ @ 1¢. Afternoon Session: Buyer season—400 tons, \$1.47; 100, \$1.46½. Buyer 1887—100 tons, \$1.36½; 100, \$1.36½; 100, \$1.36½ @ 1¢.

(COMMUNICATED.)

Market Information.

Cereals.

During the crop year ending Aug. 31, France imported 39,015,507 bu. wheat, against 18,528,831 bu. during the previous 12 months.

H. Kains-Jackson says: The barrenness of the European granary and mill-floors this season is a reproach to commerce.

Late accounts place the winter wheat crop of Russia at ten per cent above an average, while spring wheat will be five per cent less than last year. Stock of old wheat very light.

The Cincinnati Price Current makes the corn crop of the United States 1,570,000,000 bu., and the Chicago Trade Bulletin calculated upon 1,575,000,000 bu.—both based on the Department of Agriculture report.

It is estimated that the United Kingdom will have to import 140,000,000 to 145,000,000 bu. wheat during the current crop year.

Quantity of barley on passage for the United Kingdom on Sept. 1 is reported at 970,000 bu., against 2,600,000 bu. last year.

The London Millers' Gazette makes the following estimates of the production of wheat in 1887 in the countries named, compared with the yield in the year 1886:

	Estimated Crop of 1887—qrs.	Crop of 1886—qrs.
U. S. and Canada.....	60,000,000	63,500,000
France.....	40,000,000	36,000,000
Russia.....	27,000,000	21,500,000
British India.....	28,500,000	34,500,000
Austria-Hungary.....	21,000,000	18,000,000
Germany.....	11,000,000	10,250,000
United Kingdom.....	9,500,000	8,100,000
Spain.....	10,000,000	10,450,000
Italy.....	15,000,000	16,170,000
Australia.....	4,000,000	2,780,000
Turkey.....	5,500,000	5,140,000
Persia and Syria.....	5,500,000	5,500,000
Roumania.....	4,000,000	2,800,000
Chili and Argentine Republic.....	4,500,000	3,600,000
Egypt.....	2,100,000	2,000,000
Holland.....	650,000	600,000
Belgium.....	2,500,000	2,300,000
Denmark.....	600,000	600,000
Greece.....	600,000	600,000
Portugal.....	1,000,000	1,020,000
Norway and Sweden.....	300,000	300,000
Switzerland.....	250,000	200,000
Servia.....	700,000	550,000
Sundries—		
Africa, Tunis, Asia Minor and Mexico.....	6,000,000	6,000,000
Total.....	262,200,000	252,360,000
Equal bushels.....	2,097,600,000	2,018,880,000

Thus the estimates for this year, which it will be remembered are but estimates, show the world's production to be about 8,000,000 qrs. greater than last year and about 13,000,000 quarters greater than in 1885. In this connection it is worthy of note that the average production in these countries during the five years ending 1885 was estimated at about 2,200,000,000 bu.

Berthold of Sept. 9 says: Showery and rather cold weather has been experienced this week, both in England and on the Continent; in the extreme north of England and Scotland the harvest is not yet finished, and some damage to the outstanding crops is here and there reported from the rain. English farmers are delivering their wheat, compared with last year, more freely, but in France they hold aloof, owing to the low prices offered.

Berthold's Corn Trade List, Sept. 9, says: The American corn crop reports do not improve; the Roumania crop is a failure, only half a crop being expected, while in Hungary the crop is officially reported to be equal to only one-third of an average. In Roumania the food of the natives consists principally of corn, so that the failure of this crop is a national calamity, and wheat, of which there is a good crop this year, will have to take its place. In South Russia, too, the outlook is for a very short crop. Under all these circumstances, and considering the scarcity of feeding stuffs generally this year, it is not surprising that higher prices for corn in the near future are expected.

Statistical writers are engaged in the interesting work of figuring out the world's wheat requirements and the available surplus. H. Kains-Jackson places the requirements at 26,000,000 bu. in excess of the surplus; W. J. Harris places the surplus at 32,000,000 bu. excess, and another authority makes the surplus 8,000,000 bu. in excess of the requirements. With a short rye crop and root crop in the United Kingdom and on the Continent, it is within the

range of possibilities that a speculative movement in wheat will set in before the turn of the year, which will force values well up. The stock of old wheat Sept. 1, the world over, is below last year's at the like date.

The visible supply of wheat at the East is decreasing, but last year in September it was increasing. The exports from the United States continue larger than last year at this date.

Oregon advices report free sales of wheat to both millers and exporters, but latterly, under strong holding, buyers are unable to operate except at a higher range of values, particularly for the better grades. In this State buyers and sellers are still apart. Considerable fair wheat has been taken by exporters at from \$1.25@1.30 to fill sales made for September-October shipments. Millers are paying from \$1.40@1.45 for choice to gilt-edged wheat. Holders are indifferent sellers at these prices, believing that a higher range of values will follow. The tonnage here and to arrive to move the crop is more than enough for our wants, and therefore lower charters are expected.

Continued free receipts of barley keep that cereal down, notwithstanding the large increased consumption. The stocks here are not excessive for the season, considering the large demand, while the supply in the country is less than last year at this time. Oregon advices state that they will not send much, if any, to this market this season.

Oats continue in fair demand, but owing to the low price of barley and the liberal stocks here with free receipts still coming forward, buyers only take for immediate wants, unless they can secure a large parcel below the market.

Corn is steady, with buyers taking sparingly, under the impression that prices will fall when new comes in; but as the market at the East is advancing, ours is also apt to move up.

Rye and buckwheat are firm, with a fair inquiry reported.

Feedstuff.

As indicated last week, both bran and middlings are weak at lower prices. The consumption is quite large, but the low price of ground and rolled barley interferes with them. Rolled barley continues low in sympathy with barley. Other feedstuffs are unchanged.

Choice hay continues scarce and commands full prices; poor grades are in oversupply and are only worked off in buyers' favor. Alfalfa is in liberal supply. As the consumption of hay is increasing, any falling off in receipts is soon felt, and a higher range of values established.

Fruits.

Choice apples are in better inquiry, with some extra fetching an advance on top quotations. Wormy and otherwise defective apples are hard to place.

Strawberries and blackberries are growing scarcer, and command more money.

Grapes have come in more freely, but the more choice held up well under a good shipping and home demand. There has been a much freer movement than last year. Canners are taking in a small way several varieties for packing.

Wine grapes are in increased demand, causing prices to be well maintained. More wine-presses are in use in this city by small dealers in wines. Our advices from the interior report a larger consumption than last year at this time.

A large number of horticulturists are buying refrigerators for cold storage. E. Jungerman of Oakland, agent for the Beck's patent, has disposed of quite a number, with orders on hand for more.

In New York the grape crop is reported to be large and of good quality. The growers there keep their fruits by the cold-storage process, by which means better prices are maintained.

Peaches and pears are in lighter receipt, but owing to the lateness of the season, prices are not much higher.

Choice figs are firmer.

Watermelons and canteloupes fluctuate from day to day, the price being governed by the receipts.

The crop report issued by the Agricultural Bureau is very discouraging as to apples. It says the apple crop will be very short in every section where extensively grown. Prospects have been unfavorable from the beginning of the season, and the condition has steadily declined at each report. Only in New England and New York was there at any time a prospect of even a medium crop, and their condition has seriously fallen off, suffering a marked decline during the past month. Elsewhere generally the product will be limited. The Atlantic and Gulf States lose much from drouth, rotting and dropping from insect injuries. The returns from Ohio westward are of a very similar tenor, condition in most of the States standing at the lowest figure ever reported. There is an exception in the case of Michigan, where a crop but slightly under the average of non-bearing years is indicated. On the Pacific Coast condition is comparatively high, indicating a crop of medium proportions.

There has been no change in dried fruits except perhaps a weaker tone in unpeeled peaches. The Eastern demand for apricots is probably hardly as strong as it was, but the stock here of both evaporated peaches and apricots is now getting very low, and we shall soon go out with a clean deck. In the entire State there is probably not over five to six cars of evaporated apricots and as many more of evaporated peaches left, while we have a good three months' trade yet.

Dried prunes continue to boom, and are showing more strength every day. They are meeting with marked favor in the Eastern States. It was demonstrated last year that California prunes occupied a unique position in the market, and that the prices of the French and Turkish products had no appreciable effect upon them. California prunes sell for themselves, without reference to the prices of the products from other countries.

Raisins are not strong. There are peculiar circumstances at work (the chief element of disturbance being the fact that there is intense competition shown in this article this year, as has been the case heretofore) affecting this product. By all rules of trade California raisins should sell in their biggest market, that is, the Missouri River valley and Chicago, on the basis of the cost of Malaga fruit in New York, of equal grades, with freight added to Western points. In point of fact, California raisins are selling, delivered at Western points at much lower prices than the Spanish fruit can be landed for at New York. This is all wrong. California raisins are fully up to the Spanish standard, but as long as the present competition lasts we will see cut

prices. All this unsettles and disturbs the market. And this feeling is further emphasized by the fact that large operators here have not taken hold with their wonted activity, and it is said that lower prices may be looked for.

Hops.

Receipts are free, but buyers' bids are too low to tempt sellers, who look for improvement in prices. The crop of the coast is less than last year's. The Chicago Trade Bulletin, Sept. 23d, says: Washington Territory hops have usually met with a first choice, but the improvement made in the cultivation of California hops has resulted in placing them on about a par with Washington Territory. There is not the usual quantity of hops selling for future delivery. Brewers, in view of a generally good crop and the uncertainty of prices, are not disposed to contract for any large quantities; at the same time contracts have been made at 18¢@22c for prime to choice New York and Pacific Coast hops for November and December delivery. Latest reports from England, which it is believed are somewhat exaggerated, represent serious damage from recent storms, and up to this time the indications are that more contracts have been made for exporting than for importing hops.

Live-Stock.

Hot weather the past week reduced the demand from butchers, causing bullocks to rule in buyers' favor. No improvement in prices is looked for until cool weather sets in. Mutton sheep are fairly steady. Hogs are firm and wanted. Choice will fetch an advance on quotations. Horses are unchanged; the demand noted last week is still continued.

BEEF—Extra, 7¢@7½¢; first grade, grass fed, 6½¢@6¾¢ per lb.; second grade, 5½¢@6c; third grade, 4½¢@5½¢.

MUTTON—Ewes, 5½¢@6c; wethers, 6¢@6½¢.

LAMB—Spring, 7¢@8c.

VEAL—Large, 6¢@7c; small, 6¢@8c.

PORK—Live hogs, 4½¢@4¾¢ for heavy and medium; hard dressed, 6¢@6½¢ per lb.; light, 4½¢@4¾¢; dressed, 6¢@6½¢; soft hogs, live, 3½¢@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

Onions are weak and lower, notwithstanding a good demand. Receipts continue heavy.

Potatoes are in buyers' favor. Receipts are very heavy, while the supply to draw from is ample. The consumption is large.

Tomatoes are stiffer, owing to a growing scarcity and a good demand. Canners are still in the market for choice.

Summer vegetables are, as a rule, steadier, but then the market is governed by the daily receipts.

It is estimated that the crops of hay, straw, oats and turnips in the United Kingdom are 14,600,000 tons less than last year.

Owing to the light cabbage crop at the West, more cabbages are being cut up in this city for sauerkraut.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	337,173	285,627
In port, disengaged.....	60,442	79,286
In port, engaged.....	6,489	64,303

Totals..... 404,104 428,616

The above gives a carrying capacity as follows: 1887, 651,848 short tons; 1886, 677,764 short tons; showing a decrease compared with last year of 25,916 tons.

In poultry, turkeys are lower, but hens are higher. Beans are stronger, with limas and pinks making quite a decided advance.

The receipts of fall wools have increased, giving buyers a better assortment. Holders are not pressing the market.

Honey is wanted at an advance.

Fruits and Vegetables.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

Seeds, Plants, Etc.

NAPA VALLEY NURSERIES.

ESTABLISHED 1878.

Fruit Trees, Grapevines, Resistant Grapevine Stock.

And everything to be found in a first-class Nursery; also the following new fruits, obtainable only at these Nurseries:

Clyman—Earliest and finest shipping Plum.
Utatis—Earliest and finest shipping Peach.
California Advance—Earliest and best Cherry.
Purity—Most beautiful, white, canning Cherry.
Black Mastodon—Largest black Cherry known.
Centennial—The finest keeping and shipping, light-colored Cherry. (This variety is now cultivated throughout the State; to be safe, however, it is best to procure it from headquarters.)
Commercial—The largest Almond.
 Send for catalogue and price list. All stock unirrigated and free from disease. **LEONARD COATES**, Napa City, Cal. For County Rights for a new and valuable Fruit Dealer, address as above.

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KORBIE—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,
DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KORBIE, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

H. M. NEWHALL & CO., Agents, 309 and 311 Sansome St., San Francisco.

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sobrante, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the **MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD**, President, room 7, Safe Deposit Building, or

GEM SEED SOWERS.

No. 1, Weight, 130 lbs. \$20.

This Machine is run with a Chain and Bevel Gear. It is the one we have sold for years, and has given the best satisfaction of any broadcast seeder yet invented.

No. 2, Weight, 154 lbs. \$22.50.

Runs with Chain and Belt Gear. The advantages gained on the bevel gear are smoothness of movement, noiseless while running, durability of the fast-running parts, and the evenness with which it sows the grain.

No. 3, Weight, 164 lbs. \$25.

Runs with all Gears. This machine is preferred by many to the others which run by Chain. The feed valves and distributor are the same as in the others.

We have manufactured the GEM SEEDERS for a number of years, and they have given better satisfaction than any other Broadcast Seeder in the market. They throw the seed horizontally instead of vertically (as in all old-style Seeders), and thus save a large portion of the grain. Where sold they have never failed to give satisfaction. ARMSTRONG'S PATENT FORCE FEED is attached again this year, and is considered by those who have used it, a great improvement.

THE GENUINE GEM SEEDERS are manufactured exclusively for us at Benicia. SEE THAT OUR NAME IS ON THEM.

Adulteration of Foods and Medicines.

The issue pressed upon our notice by the false charge of adulteration made against California butter in Portland draws attention to the general subject of adulteration of food and medicine, which is a matter of the greatest importance the world over. Great progress is being made in this country in detecting and preventing frauds of this kind; and where there is one mistake made and injury done, as in the alleged analysis of California butter at Portland, there is on the whole the highest benefit resulting from censorship of foods and drugs, as it is now being exercised by the State and City Boards of Health at the East. It has been shown clearly that in New York and Boston, since the inspection of milk began, the average of purity has increased in a most gratifying manner. Milk-sellers do not dare to handle bogus or watered milk, because the danger of discovery and punishment is so great.

We believe the control of foods and drugs has reached a higher perfection in Massachusetts than elsewhere. The project has been a popular one for years. Governors have commended it most highly and legislatures have appropriated good sums of money for the carrying on of the work. We are told that now a manufacturer of foods or drugs, before putting a line of goods on the market, submits samples for examination, and if he does not get a favorable report, he ships the goods to some unfortunate locality out of the State, and does nothing to sell them within the limits of the old Commonwealth. This is not welcome news to the rest of the country, for we may have to consume the Yankee notions which will not do to sell in Massachusetts. To protect against this, each State must adopt protective measures, and so hedge about the way of the adulterator that he shall cease his nefarious arts or practice them only upon the heathen.

The General Government is making an important contribution to the effort for purity in food and medicine by publication by the Department of Agriculture of a series of special reports on "Foods and Food Adulterants." The first treated of dairy products and was by Prof. Wiley. The second is just out and relates to "Spices and Condiments," by Clifford Richardson. It is an exceedingly interesting publication, describing the materials commonly used to adulterate these articles and methods for detecting them. It is illustrated by a series of engravings made from photomicrographs of pure and impure materials as seen with the microscope. Any one who likes to work with the microscope should apply to his representative in Congress for a copy of the pamphlet and then go to work with the materials which come from the stores. We need a vast host of qualified observers to detect adulterations and to aid in cultivating public sentiment against them. Educate the people in these matters and they cannot be easily imposed upon.

GRAIN IN SIGHT.—The visible supply of grain for Oct. 1st, compiled by the N. Y. Produce Exchange, was: Wheat, 30,906,777 bushels; corn, 7,087,448 bushels; oats, 5,177,636 bushels; rye, 321,962 bushels; barley, 1,128,358 bushels.

W. M. WILLIAMS, whom the Governor lately appointed Commissioner for the San Joaquin District on the State Board of Horticulture, declines the proffered honor.

FORESTRY REPORTS.—The State Board of Forestry has received from the State Department at Washington a most valuable book on forestry in Europe. It is made up of the reports of the U. S. Consul-Generals and Consuls

GOOD BRANDS AND POOR FRUIT.—The Santa Rosa Democrat claims that a large canning concern, which has a branch at that place, is using Santa Rosa labels on the inferior fruit which they ship out of the State and on which

The Witch Hazel.

We reproduce from Dr. Vasey's sketches of Native Medicinal Plants another growth which will recall to many of our readers memories of youthful rambles to the neighborhood of the old home east of the Mississippi. The plant is the witch hazel, which from the earliest times has been employed as a curative agent, and which, from its peculiar appearance and autumn blooming, is one of the first bushes known to the wood-roaming children. It is a small tree, 15 to 25 feet high under favorable circumstances, but more commonly a straggling bush, 10 to 15 feet high, growing in most of the States east of the Mississippi, usually in damp woods or on the banks of streams. It forms the type of a natural order (*Hamamelaceæ*), which includes about 15 genera in different parts of the world. The genus *Hamamelis* is represented in the United States by one species, *Hamamelis virginica*, another very similar one being found in Japan. The leaves are short-stalked, three to six inches long, oval or obovate, slightly heart-shaped at the base, with the sides unequal, with straight conspicuous veins, the margins wavy or with coarse obtuse teeth, and somewhat downy when young. The tree or shrub is remarkable for its late period of flowering, which is in September and October, while the leaves are falling, and continuing on until winter. The development of the ovary or young fruit begins in the following spring, and is not matured until the fall. The flowers grow in small clusters or heads, each with a three-leaved scale-like involucre at the base. The calyx is thick, four-parted, and woolly on the outside. The petals are four, strap-shaped, nearly half to three-quarters of an inch long, and of a bright yellow color. There are eight short stamens, only four of which are perfect. The small hairy ovary occupies the center of the flower; this finally develops into a two-beaked, two-celled, thick and hard pod, with a single, black, bony seed in each cell.

Both the bark and the leaves are used medicinally in domestic practice, in the preparation of certain proprietary remedies, and in the practice of physicians. It is stated that they were used as a remedy by the Indians. Fig. 1 shows the flower's natural size; and Fig. 2, an enlarged flower.

INJURY TO SPANISH RAISINS.—According to a cable dispatch from Denia, Spain, Oct. 3d, the Valencia raisin-growers are having a sorry time with the weather. The dispatch says: "It has been raining for a week, and the loss to the crop is estimated at 10,000 tons. Cannot get any stock, as the market is bare and is expected to so continue for some time."

W. H. REED and O. L. Sharpstein, counsel for the wheat-growers of Washington Territory, have gone to Washington to prefer charges against the Northern Pacific Railroad Company for extortionate freight rates on wheat from Walla Walla to Portland, and are to be heard before the Interstate Commerce Commission on the 14th.

HORTICULTURAL SOCIETY.—The pressure of the State Grange report, the accounts of fairs, etc., upon our columns this week, forces us to lay aside until next week the report of the Horticultural Society. The meeting was well attended and interesting, as the report will show.

THE WITCH HAZEL—*Hamamelis virginica*.

on the forestry of the nations to which they are accredited. These reports were ordered by the Secretary of State at the suggestion of the Chairman of the State Board of Forestry of California, Hon. Abbot Kinney. Persons interested in forestry can obtain this book by applying to the secretary, Mr. Sands W. Forman, Room 42, Nevada Block, San Francisco.

GLANDERS.—The Morning Call says that 15 glandered horses have been killed in Oakland recently.

they do not care to put their own brand. If this is true, it is a very reprehensible proceeding. The remedy would be for each locality to own its own cannery and then it would control the use of its own labels and could see that there was nothing but good fruit under them.

CONDENSED MUST.—The Healdsburg Enterprise reports that the Condensed Must establishment at Geysersville is working smoothly, and several carloads of condensed must have been shipped.

POULTRY YARD.

Poultry a Means of Wealth.

I. K. Felch, the well-known writer on poultry, has the following interesting notes in the *Poultry Monthly*:

A long essay could be written upon this subject before it would be exhausted. This poultry industry has been so evenly distributed over the land, and the products of our poultry-yards so largely consumed at home, that few have looked upon it as a means of accumulation, and few understand what a factor it is in a nation's wealth, but the experience of the past few years has established this fact, and that by its agency many have been able to amass quite a savings bank account. Many items appear from time to time to bring this subject forcibly up for consideration, among them the following:

During the season of 1885, from June 15th to September 15th, one hotel in Saratoga paid in one bill for supplies, the following list, which aggregated \$125,000: 90,000 pounds of beef; 18,000 pounds of mutton; 20,000 pounds of lamb; 7000 pounds of veal; 15,000 pounds of pork; 60,000 pounds of chicken; 35,000 pounds of game; 26,000 pounds of fish; 6000 pounds of salmon; 900 dozen squabs; 24,000 dozens of eggs; 22,000 pounds of butter; 65,000 quarts of milk; 10,000 quarts of cream.

How is this for a list of farm products consumed by one hotel? I suppose you are aware that the item "game" takes in the green ducks and geese which are now being raised to fill the place of wild ducks, trout, etc., now protected by the game laws of the land at that season of the year.

The point which I wish you to consider, and the reason for introducing this bill, is the large proportion that comes from poultry culture. Fully 127,000 pounds of that bill was produced in our poultry-yards and lofts. Is not this bill a substantial backing for our estimate of the magnitude of our pet industry, as reaching \$640,000,000 annually?

This hotel is as large as many a common-wealth we could name, and this bill a fair criterion of the meat supply and the proportion furnished by poultry-raising, and another proof of the poultry agency and wealth of a nation.

Many of us are rearing fowls for the love we have for the beautiful found in animated nature, but take from this industry its utility and the numbers raised would be but as a handful of sand compared to that which makes up the ocean's shore. This influence you see in the scarcity of numbers in the ornamental breeds in our exhibits of them.

Those breeds having the greatest practical worth, being the most prolific layers; those producing the largest eggs and the best meat as broilers and roasters; those laying the larger number of eggs in the winter months—these will ever be the kind to hold the popular call and the steadiest sale, and their breeders will always be "tided" over a dull season, while the breeder feels more quickly the fluctuation of the market whose tastes lead him to breed those termed ornamental.

We have only to survey the field to find that a majority of the breeders, who make poultry culture a business and means of support, are breeding the most practical kinds. Self-interest takes them in this direction, and you hear them loud in their praise. It is not because they do not breed the other varieties, but that the practical breeds are a necessity to them and the success of their business. Taking such a survey of the industry, we find, of all the breeds that have added most to this item of wealth, that the Light Brahmas, Plymouth Rocks and Wyandottes stand first in the list of breeds, and while the others pay a profit, in comparison become ornamental, so to speak, for they pay less.

When we take up the branch of exhibition specimens into which personal taste and love of the beautiful in their plumage influences largely the price, we find a greater fluctuation as the exhibitions in our land increase or diminish, consequently fewer breeders of them. The exhibition becomes the prime motive in the breeding of the more fancy sorts, for they beautify the collections; yet these very exhibitions find their largest classes made up of the most beautiful specimens from the most practical breeds, and the winners from these useful classes always demand the highest prices. England furnishes us instances where \$500 per trio, and \$250 have been paid for single Brahmas. America boasts of \$200 paid for a pair of Plymouth Rocks, and single males in Wyandottes bringing nearly \$100.

Love of the rich for possession makes these prices possible, and even the requirements of breeding enable the breeder to sell a cock to score 95 honest points at \$100, and instances of breeders refusing a larger price are on record. But although these prices are beyond the reach of poor men, I am thankful breeders, by skill and hard work, often produce them, and in selling them to the rich and generous, causes the purchaser happiness in the possession, while joy comes to the seller in the thought of the added comfort he is thereby enabled to furnish to his family. And this is the question: How may this wealth and industry best be controlled by the poultry breeders of the land? That should interest all.

The women in this connection should not be forgotten. It is a gratifying fact that this in-

terest is attracting many women to the breeding and exhibition associations. Both women and children engage in this calling successfully. Women, by their gentleness and large stock of patience, even by the love of pets and children, show themselves best fitted to care for the flocks. Many women suffering from illness because of close confinement indoors are recovering their health in this interesting occupation. The time is coming, and shortly, when the women of America will vie with their French sisters in controlling largely the poultry culture of their land. Woman has asserted herself; has already forced an acknowledgment of her ability. Not a trade, profession or calling but woman is to be found therein. Even Chicago has her woman blacksmith and horse-shoer.

This industry is open to her; she will embrace it, succeed in it; for in any business demanding attention to detail, women always excel men, but the field is open to both. Let both work together to control this industry for the benefit of the wage-workers of the land.

COTTON AND WOOL.

Cotton-Growing in California.

Persons who are thinking of going into the cultivation of cotton in this State as a profitable agricultural industry, must count upon managing the same upon a basis of the closest economy in every step of the work. A late number of the *Savannah News* gives the following as the cost of raising cotton in Georgia:

"A very reasonable estimate on fair land is figured out as follows: Rent per acre, or interest on investment, \$2.50 (this, of course, includes taxes, fencing, etc.); preparation of land, \$1; fertilizers, \$6; planting and seed, \$1; hoeing, \$2; plowing, \$1; gathering, \$4; ginning and packing, including bagging and ties, \$2; total, \$18.50, less seed valued at \$2.25. Say the yield is 250 pounds, the cost at the gin-house ready to be baled to market is 6.3 cents per pound. The above is a fair average estimate when seasons are favorable. It will cost an extra cent to send the cotton to market and sell it, allowing for drying out and consequent loss in weight. It will be seen from this that there is no money in the crop at prices that have prevailed in recent years, unless the quality is extraordinarily good. The average quality of cotton produced in Georgia is low middling, and the price is singularly near the estimated cost of production. When fertilizers and supplies are bought on time, the cost of the crop is usually from 15 to 25 per cent greater than the foregoing estimate. This, of course, makes the cotton cost more than it brings in the market, and it is not difficult to see how it is that planters lose money when they do not conduct their plantations according to strict business principles and with economy. It is true that there are few planters that own their land who make more than fair rent off their cotton crop, and there are very few renters that make any money at all on cotton. There are plenty of farmers in every part of the South, however, who make money from diversified farming."

Experiments in this State show that we have the advantage over cotton-growers in the Southern States in a larger average of yield per acre. It is also well known that we have here less difficulties to contend with in the climate. Our freedom from rain during the picking season is a great advantage, and for some years at least there will be little or no need for fertilizers. This last item is a very important one. A California-grown cotton is also of a much better quality than the average of that grown on the uplands of the South, approaching more nearly to the character of the sea island cotton of the eastern portion of the Atlantic States. We also have the advantage of transportation in our favor. Cotton grown in this State should be manufactured here, as it undoubtedly will be. Indeed there is even now quite a demand here for the raw material to supply the Oakland Mill and the Woolen Mills as well, all of which latter use more or less cotton to mix with their wool. Taking all things into consideration, there is good reason for believing that cotton-growing will eventually become an important industry in California. A cotton-seed-mill should also be provided for utilizing the seed.

The Woolen Industry.

Bradstreet, some time since, gave reports of the condition and prospects of the New England woolen industry as obtained from 227 mills. These reports corroborate the general impression of the unsatisfactory status of woolen manufacturing in New England, which is but an example of what prevails in all the States. The practice of making goods only upon orders has now become quite general, and one that cannot be prudently disregarded. It has been growing in favor since the close of the civil war, but more especially since 1872 and 1873, till now no mill seems disposed to hazard the manufacture of goods in anticipation of their favorable reception by the trade. If there be any exception to this rule it will be found with mills on staple commodities whose styles remain practically the same from season to season. Orders are now given very limitedly, and much machinery is idle in consequence. Many mills

that are now running on orders will stop unless new orders come in before the old ones are filled. The reports from the 227 mills indicate a condition, as compared with that existing 12 months ago, of general inactivity, as follows: Forty-four per cent of the mills are doing the same, 32 per cent are doing less, and 24 per cent are doing more. The large percentage doing less is enough to denote a marked depression that must have a general influence. A number of the mills that report the same amount of production do so because of having on hand unexecuted orders, but as these will soon be filled the mills will stop unless supplied with fresh orders. Manufacturers will avoid the stopping of machinery, if possible, preferring to take orders at cost rather than to accept a loss resulting from the idleness of machinery and the disorganization of the labor system of the factory.

The opinions as to business prospects vary, of course, with each manufacturer's affairs, as they stand in the present and as they give promise for the future. Thirty per cent of the opinions reported regard the prospects good, 35 per cent bad, and 35 per cent uncertain. From this representation, less than a third of the manufacturers have reasons for expecting a favorable trade for the future, and more than two-thirds consider the prospects as unpropitious. Manufacturers who are on fine goods feel the inauspicious condition of business more than those on medium or low grade of woolen fabrics. The demand is excellent for satinetes, fancy and plain, and is likely to remain so during the season. The complaints from manufacturers allude but slightly to labor troubles. Allusion, however, is made to the importation of foreign merchandise at undervaluation—enough to furnish a supply of woolsens that, in quantity and price, seriously interferes with domestic productions. Since the beginning of the year the importations of dress goods have been 28 per cent more in quantity than those for the same time last year. In connection with this we will remark that the last statement from the Bradford consulate showed a falling off of nearly 26 per cent in the value of worsted coatings exported to this country in April, as compared with the value of exports during the same month last year. There was also a falling off in the value of worsted yarns of nearly 83 per cent for the same period.

THE LUMBERMAN.

The San Diego Lumber Trade.

The San Diego Union gives an array of figures and facts which speak well for the growing prosperity of the extreme southern portion of the State. They tell a tale of wonderful progress. According to this report the importation of lumber into San Diego during the month of August was nearly double that of May last. The Union says: The receipts of lumber at this port is a good index of the amount of the building operations in progress. With a view to ascertaining what is the present condition of that trade, a Union reporter interviewed a number of lumbermen yesterday afternoon. They were unanimous in declaring that their sales of lumber are almost doubling every month, and the present demand is more than taxing the full capacity of all available shipping facilities. There is a great scarcity of vessels, notwithstanding the fact that many of them have lately left other freighting to go into the lumber-carrying business. In consequence of the rush, the freight charges on lumber from Puget Sound have advanced from \$6 to \$7 per thousand.

The Mills Overtaxed.

Besides the difficulty in finding means of transportation, there has also of late been much delay on account of the mills not being able to get out lumber fast enough to supply orders. Orders that were formerly filled in six or seven weeks now require three or four months. A number of orders have also been rejected by mills, from whom word was received that they had more orders ahead than could be filled in six months. Formerly almost all the mills in the lumber ports had a constant supply of lumber of all kinds on hand. Now often a vessel is compelled to wait till the lumber is brought from the mill. All lumbermen are complaining that in consequence of the rushing demand and difficulty of getting ready supplies, their stocks are being kept down to such small quantities that they are barely able to fill orders as they come in from day to day. As there is a large increase in the demand every month, there will of necessity soon come a time when orders from builders will have to be rejected, unless the number and capacity of the mills in the lumber region are greatly increased. It is said that at present all the mills are run to their fullest possible capacity, and the demands are barely being met.

Figures and Facts.

The number of feet of lumber received at this port last month was 15,000,000. This was an advance of nearly 3,000,000 over the receipts for July, and nearly double the number of feet received in May of this year. It was also nearly as much as was received during the months of January and February of this year. The total amount of lumber received at this port up to September 1st, of this year, was in

round numbers, 84,000,000 feet. This, in eight months, is an increase of 45,400,000 over the receipts of last year, when 38,600,000 feet came into the port. Last year there was also an increase of 23,600,000 feet over the receipts of the year before, when 15,000,000 feet were received. It will thus be seen that last month there was as much lumber received in this port as was received during the whole of the year 1885, only three years ago. During the last three months there were 20,000,000 more feet of lumber received in this port than during the whole of last year.

The Outlook.

It is estimated, according to the outlook at present, that a total of 135,000,000 feet will be received in this port during the present year. This will be four times as much as was received last year and nine times as much as came to this port in 1885. As a prominent lumber dealer remarked, these comparisons give a startling idea of the tremendous growth of the trade, not only during the last year, but also during the last few months of the year.

Lumber Items.

The Puget Sound mills are said to supply 90 per cent of all the pine lumber used in this State.

It is said that 29 vessels and 130 lives were lost last year in the lumber trade on this coast. This is a most extraordinary loss of life for the number of men engaged in that branch of our coast trade.

The rapidly increasing demand for lumber in the southern portion of the State has drawn so largely upon the production of the Puget Sound mills that the demand is greater than any possible supply. Much delay is caused in vessels having to wait their turn in loading.

The lumber produced by the small mills in the Sierras is mostly taken up by the local trade near the mills, and very little of that product ever reaches the larger markets.

The boom in Southern California has largely increased the price of lumber on this coast.

Among the last year's losses in the lumber business it is claimed that Pope & Talbot dropped \$300,000. Dean & Co. are said to have lost \$75,000. Many minor millmen met with severe losses. It was such facts as these that had much to do with the organization of the lumber combination by which it has been possible to bring about the advanced price of lumber which has been met with the present season.

PACIFIC COAST LUMBER—LIVELY TRAFFIC.—Large sawmills are now in operation at various points on the North Pacific Coast railroad, and the lumber traffic on the line is at present tremendous. The Willows Creek mill at the head of the new extension is turning out at least 50,000 feet of lumber daily, while the mills on Austin creek and on Russian river are turning out similar quantities. On Friday night there were 133 loaded cars on their way to Sausalito and San Quentin, besides others being unloaded at these points. There are now eight vessels at the various wharves belonging to the company loading lumber for the city. The largest cargo moved lately was a quantity of beams and timbers for the use of the Spring Valley water-works in the construction of their flume across the bay.

ILLEGAL TIMBER CUTTING.—Acting Secretary of State Muldrow, at Washington, has requested the Attorney-General to institute suit against Thomas L. Greenough, principal contractor for the Northern Pacific Railroad Co., for the value of 700 ft. tamarack and pine trees, alleged to have been unlawfully cut from Government land by the defendant. C. C. Frost, Special Timber Agent, has reported to the General Land Office that the Northern Pacific Railroad Co. has seven lumber-mills on unsurveyed lands in the Cascade mountains in violation of law and the department regulations. The *Shasta Courier* says: It is reported that a few platoons of individuals will be arrested by United States Marshals for fraudulent filing on timber-lands in Shasta and Siskiyou.

A PUGET SOUND SAWMILL PRODUCT.—There is an interesting exhibit at the Mechanics' Fair in this city, which consists of an immense stick of lumber from Puget Sound. Its proportions are colossal, its length being 151 feet and 20x20 inches. Supt. W. P. Stout, who is a connoisseur on lumber, hazards the assertion that it is the largest stick of lumber ever turned out of any sawmill.

SEASONED TIMBER.—It is said that timber may lay under shelter for years, and become thoroughly seasoned, and yet, when sawed into smaller dimensions, the pieces will shrink. This is because of the new surfaces which are exposed to the air, and which always change slightly when first exposed.

TIMBER IN PLACER COUNTY.—It is estimated that Placer county has 450,000,000 feet of lumber fit for manufacturing purposes in her forests.

FORESTS cover 24 per cent of the entire area of Norway.

THE St. Helena Independent says: In conversation with Mr. Schram, he stated that the amount of sugar was greatly in excess this year, some of his grapes running as high as six per cent above what is normal. The result is a great amount of trouble to get good and proper fermentation.

THE VINEYARD.

To Avoid and Correct Imperfect Fermentation.

The Chief Executive Viticultural Officer has prepared the following statement:

The number of grape-growers who have this year become wine-makers for the first time warrants the publication of a few rules for the management of troublesome fermentation. Dry seasons are particularly productive of what, in California wine makers' parlance, are known as "stuck wines." These are wines which fail either in commencing or completing their fermentation.

To Start Fermentation.

Wines which are slow to commence fermentation are easily started. This trouble occurs most commonly with the first grapes crushed, particularly where they lay exposed to the chilling effect of a cold night and are crushed early in the morning before being again warmed by the sun. The must is then apt to lie dormant in the fermenting vat for several days before the germs show any healthy action. The same delay in starting is sometimes produced in grapes crushed for white wines, when the must is run into barrels exposed out of doors over night, thereby becoming cold. The delay in starting these cold musts is seldom productive of any great evil; but the annoyance and loss of time caused thereby may be completely avoided by crushing the grapes when warm, and then protecting the must against any considerable reduction in temperature.

The temperature most favorable to the action and development of the yeast germ ranges between 75 and 85 degrees. The fermentation would, therefore, be greatly aided in starting by bringing the new must to this degree of heat and maintaining it thus until a good, healthy action prevails, after which the heat produced by the ferment will be sufficient.

If the grapes have been chilled before crushing it is well, in addition to the warming, to add a little clean, fresh yeast. The best for the purpose is the compressed yeast, sold in small cakes throughout California, although any well-washed, fresh yeast will do. Some wine-makers always introduce this yeast into the first must to insure a prompt commencement.

Once the yeast plant gets established in any vat of the fermenting-room it readily takes possession, unaided, of all the must subsequently introduced.

There are some wine-makers, however, who insure a prompt start of each vat after the first by mixing in some of the lees or yeast of a working or previously finished must.

To raise the must to a suitable temperature, a steam coil may be used. In districts where the sugar runs high, the steam is blown directly into the must by means of a hose, the opening of which is placed within and near the bottom of the tank. Where steam cannot be had, portions of the liquid may be heated successively and returned to the vat or cask until the whole marks 70 degrees or over. In doing this, the heated portions should not reach a temperature exceeding 125 degrees. Under peculiar circumstances, the yeast plant will stand a temperature approaching 140 degrees, but it would not generally be safe to heat it above 125 degrees.

Very low temperatures, if not changing too suddenly, do not destroy the yeast plant, but render it temporarily dormant and unproductive.

Some winemakers deprecate the use of yeast as injurious. I have yet to learn, however, of any deleterious results accruing therefrom. Some even resort to a handful of grape leaves or other materials claimed to assist the must in starting.

Musts High in Sugar.

The trouble in starting the first vat is small, as compared with what often comes later, especially when the weather is dry and hot or when the must shows 26, 28 or 30 per cent of sugar. Then comes the new winemaker's trial, and with old ones, too, the trouble not infrequently begins.

Without attempting to explain the causes which may lead the wine to cease fermenting, I will proceed to state the best and commonly adopted methods of avoiding the trouble and the best methods of finishing wines "stuck" with from two or eight per cent of sugar.

When the season is dry, and the must marks over 24 per cent saccharine, especially if the atmosphere seems wanting in moisture, and there is an absence of dew, fog or rain, the utmost care should be exercised to avoid any other causes liable to obstruct fermentation in red wine.

Shallow Vats.

Shallow vats are invaluable for disposing of troublesome red musts, principally because of the ease with which the same may be worked and aerated; also because the mass is so spread out as to avoid the excessive accumulation of heat. For these reasons cement vats are preferred in many of the southern districts of Europe, where wine-makers are similarly troubled.

These vats are made large and shallow so that the must may be continually stirred and worked over. The cement answers better than wood, as it serves to carry off the heat which accumulates too rapidly in some districts of the South. Some wine-makers, I have learned, ferment commonly in wood, but have their

cement vats to which the stuck wines are relegated when they chance to occur.

Next in value to a shallow vat is a shallow mass in a deeper tank, which serves somewhat to alleviate the impairment of the ferment, but this is never equal to the shallow tank in seasons of excessive sugar.

The Use of the Stems in Fermenting.

Fermenting on the stems aids the process, and may be safely adopted in red wines if they be found ripe enough. When the butt of the stem is brown and woody and the whole possesses a tough and wiry appearance—not green, brittle and sappy—it may be safely added, and will aid greatly in avoiding trouble later on.

Much difference in opinion prevails as to whether the use of the stems improves the wine or not, and this, too, among competent wine-makers; some ferment all red wines on the stems while with others they are never employed. The best authorities, however, agree on their value, being governed by circumstances, the season, ripeness of the grapes, etc., as to the quantity to be used. In the case of troublesome wines which we have under consideration, it is doubtless best to employ part or all of them. They are needed not only to assist fermentation but to increase the acid of the wine—wanting usually in this respect, in seasons of over-ripeness. Such wines, too, can safely stand some of the harshness arising from the stems which will also give them keeping quality.

I should never counsel the use of stems that are green, brittle and sour, but as those seldom accompany troublesome seasons they need hardly be mentioned.

Blending in the Fermenting Vat.

The fermenting together of different varieties, or of the same variety from different soils, is a method well to adopt in seasons when trouble is apprehended. Red grapes generally ferment better when 10 or more per cent of white grapes are added. The fine wines of Europe are often made in this manner, the quality being improved by the process.

If, for fear of losing color or other reasons, the white grapes cannot be had, the blending of two or more varieties of red grapes will prove healthful to the ferment and will make, too, a better blend if mixed intelligently with a previous knowledge of the qualities of each and their appropriate proportions.

In filling the vats, if the first crushing runs high in sugar, the balance should be made up of grapes running enough lower to bring the whole to a medium strength.

Proper Maturity.

It is difficult to indicate the exact degree of sugar desired in all cases, in that it should be governed largely by circumstances. It is safe to say that wines seeking an early market will profit by all of the sugar which can be fermented out. Wines lacking in color will be improved by as complete maturity of the berry as is possible to ferment dry; in fact, there is everything in favor of complete maturity of the grape, except the difficulty produced by its fermentation. Not only does it become difficult to manage the fermentation, but when too high in sugar, the wine resulting, though apparently dry, may possess sugar sufficient to trouble it for years after.

These considerations must all be known in limiting the maturity of the grape and in determining at what degree they should be picked.

By a little attention to the mixing of the grapes at time of picking, all of the good qualities may be obtained in a single vat, each lot performing its proper function. Not infrequently, however, we find varieties picked and fermented separately, each making a wine which possesses some excess or defect, but which would be corrected by judicious blending with some other variety or lot possessing a corresponding defect or excess, be it color, acidity, strength or harshness.

Fermenting Without Crushing.

Where there is any promise of trouble in fermentation some wine-makers resort with red wines to what is known as the "Moret process," viz., that of placing the grapes directly in the tanks without either stemming or crushing. The mass is stirred and worked an unusual amount to start fermentation, which then continues, slow and uniform, and usually finishes without trouble. The greatest objection urged to this method is that in the subsequent pressing of the pomace some grapes that were not ripe enough to ferment and burst are here opened and contribute a certain amount of sugar to the liquid, by this time supposed to be dry. Drawn into sulphuring tanks or a cool cellar for keeping, the sugar manifests itself later on, to the great annoyance of the maker and detrimental to the wine. This objection may, however, be overcome by arranging to continue fermentation of the wine when pressed, or, better still, by keeping the press wines separate for further fermentation or brandy-making, retreating only that to the keeping-cellar which comes off without pressing.

Be it known that this process conduces to slow, uniform and complete fermentation of just those berries which are ripe enough to make the best wine, and that this drawn off without pressing separates the better from the poorer wine. The method is by no means common, though it has afforded satisfactory results in many cellars and proved an efficient preventive of tumultuous and incomplete fermentation.

As a last resort, when the must marks 28 per cent of sugar or over, water may be used for extending the same. This method is recognized as legitimate by the Pure-Wine law of California. It is employed freely by some vineyardists and authorized by many good authorities. Others there are who contend strongly against it, and there are laws in Europe prohibiting it.

Without entering into a discussion as to its merits or demerits, I should advise that musts showing too high a percentage of sugar should, in the absence of other and better remedies, be reduced with pure, fresh water or else fermented with a view to making port wine.

The addition of water alone to high musts will not always insure perfect fermentation, as many people suppose. To obtain the best results, however, the water should be added as soon as the grapes are crushed, and it should be then well incorporated with the mass, bearing in mind that the addition of this, as of any other substance not coming directly from the vine, should be used only as a last resort. To extend the must with water, it is found that about five gallons of water are required to reduce the must from a ton of grapes 1 per cent in sugar. For example, to reduce one ton of must from 28 per cent to 25 per cent would require about 15 gallons of water.

Other Aids to Fermentation.

Enaotannin and cream of tartar are employed by some to assist fermentation and are valuable for either white or red wines. These substances produce, it is claimed, desirable qualities in the wine and improve the color of red wines. Their use is permitted and recognized by our law as harmless. When employed for red wines, they should be sprinkled over the must at the time the grapes are crushed, at the rate of two ounces of enotannin and one-half pound cream of tartar to each ton of grapes. Thus used they have been found to make the fermentation regular and uniform.

Stirring the Must.

Complete and constant stirring forms a valuable adjunct to fermentation at all times; particularly it is necessary when the must is hottest and most active. The measure of success is not infrequently determined by the amount of working-over the wine receives. In working red wines in high tanks this is done with a tool made of a piece of scantling about six feet long, enlarged by cross pieces, or even cleats, nailed on at the lower end. A cross piece answers for a handle at the top. A close-tined stable fork or other more effective tool may be employed if the tank be shallow and the must is not too deep.

The "Stuck" Tank.

If selecting and adopting in advance of the work, proper precautions, as above described, there is seldom cause for further trouble.

There often occur, however, through carelessness or otherwise, tanks "stuck" at from two to eight per cent of sugar. The wine has commenced fermenting all right, has boiled up tremendously, to the intense delight of the maker, when lo! on coming out the next morning the cap has dropped; the wine has become inactive and cold. The bubbles have almost ceased to rise, and yet the must marks several degrees of sugar remaining.

There is one common and usually effective proceeding to start up fermentation. The wine, or partly finished wine, if for claret, should be drawn off and the pomace pressed and rejected or sent to the distillery. Let the wine so drawn be placed in two or more tanks and an equal bulk of fresh grapes added. For the best results the grapes added should be, if possible, some variety known to produce good fermentation. See, too, that they are low in sugar. If such grapes are not available, secure the same variety from some other locality or soil, taking care that they are as low in sugar as possible.

The desired result has often been obtained by drawing the stuck wine directly on to newly crushed grapes of the same kind and from the same place; but there is greater assurance of success when the variety or locality is varied somewhat, and the grapes chosen are lower in sugar. White wines should be pumped on to new must in a similar manner.

Errors of Beginners.

New wine-makers are prone to fall into the error of only half doing this work by adding a few boxes of fresh grapes to the stuck tank, expecting thereby to complete fermentation. This has been known to succeed in rare cases, when the trouble was light and the variety added was Berger or some other—noted alike for its low saccharine and favorable fermenting qualities. Generally, however, it is time thrown away to do other than what I have indicated at first, viz.: If red wine, draw off the wine, press and reject the pomace, and commence fermentation on newly-crushed grapes. If this fail—which it will do but rarely—the maker can try the same again, employing fresh grapes of some other variety, still lower in saccharine, and combining all of the precautions indicated in the first of this article, or, if these latter are unsatisfactory, it may be necessary to reduce the newly-mixed must to about 24 or 25 per cent sugar by the addition of water. If all of these fail there is left no alternative but to make port wine, or send it to the distillery. There is rarely any necessity of this latter extreme if the first instructions I have given are followed.

In place of pumping the stuck wine on to new pomace some wine-makers prefer to let the fer-

mentation finish in casks or tanks. This it will do if small packages be employed and the must kept in a favorable temperature. No one, however, is so certain of good results, nor so frequently practiced, as the method of renewing fermentation on new pomace, or new must, if for white wine, and finishing the wine up before the final drawing or pressing.

I have not attempted here in this hurriedly prepared article to explain the reasons why these troublesome fermentations occur. There are many theories as to their causes, and great difference of opinion exists unnecessary for me to discuss at this time. We know the circumstances under which the trouble usually occurs and the methods of their avoidance. These methods—most of them well known to old wine-makers—I have aimed to present at this appropriate moment. This is done more in view of keeping the inexperienced out of serious trouble by artificial means than of explaining the causes of the natural phenomena which occur as they have in times past, or may occur in the future.

J. H. WHEELER,
Chief Executive Viticultural Officer.

HORTICULTURE.

Apricot Paste.

EDITORS PRESS:—I am asked by one of your readers to tell through the PRESS all I know about the making of that "delicious apricot paste" to which I incidentally referred in my paper on prunes, as read at the last meeting of the State Horticultural Society.

What I know is but little, except that in France they turn an immense quantity of apricots into what may be termed more properly in English "apricot candy" than "apricot paste." Some towns in the apricot districts in France make a specialty of this candy or paste, such as Clermont-Ferrand, in Central France. The common apricot is the kind mostly used in the making of that paste. It is cooked with sugar—in what proportions I could not tell—and boiled down to the consistency of a thick jam or dough. It is then spread out on cloth or large tin plates with a long, thin-bladed knife such as is used by confectioners, to half an inch or about in thickness. After having cooled off somewhat, it is cut in small blocks through tin patterns figuring rounds, squares, lozenges, hearts, etc. When dried these little blocks have the consistency of soft candy, and they are packed in fancy boxes like prunes. France consumes and exports an enormous quantity of this apricot candy, and it struck me that in California, where apricots are so plenty that people do not know what to do with them, some of our enterprising people could turn this immense waste material into this delicious candy, which, I am satisfied, would take well with the American people.

But apricot candy is far from being the only use which the apricot could be put to, for there is no fruit that can be turned into so many different forms as the apricot. The French have about 15 different ways of preparing the apricot.

First, when perfectly green and small, it is pickled; and the thinning out of trees too much loaded cannot but help the remaining fruit.

In Bordeaux, apricots are prepared in a crystallized state in syrup and apricot juice, and put up in boxes under the name of "abricot au sirop," of which vast quantities are exported from that industrious city. There are also apricot jam, apricot jelly, apricot preserve, made both with green and ripe apricots, apricots preserved in brandy, in syrup, dried apricots, canned apricots, apricot sauce or cider and a number of other ways of preparing the apricot, and all very "Frenchy" in their very preparation.

Thus you will see to how many good uses this pretty fruit can be put. Let some enterprising confectioners start in an apricot center an apricot confectionery, where apricot paste or candy, apricot jam, crystallized apricots, etc., would be prepared, and I predict that much money could be made in that way, and a new impetus given to apricot-growing in this State.

In Turkestan, Central Asia, the peasants dry the apricot in the sun and on the roofs of their habitations, and make with it in its dried state a kind of mush or soup.

In Paris, cheap restaurants serve on the table of their customers stewed apricots, or rather, under that name, pumpkin so skillfully prepared that some people cannot tell the difference; and yet the Capital of France swallows every year over 12,000,000 pounds of apricots.

FELIX GILLET.

Nevada City, Cal., Sept. 24, 1887.

TO PRESERVE ROPES FROM DECAY.—It is said that ropes used for scaffolding purposes, especially in localities where the atmosphere is apt to destroy hemp, should be dipped when dry into a vat containing 20 grains of sulphate of copper per niter of water, and kept in this solution about four days. The sulphate of copper absorbed will, it is believed, preserve them from attacks of parasites and rot.

ABOUT A HUNDRED men are engaged in enlarging the Bear River ditch. In a few weeks Placer county will have all the water necessary for irrigation purpose.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

The State Grange.

The California State Grange, P. of H., met at Santa Rosa, Tuesday morning, Oct. 4th, at 10 o'clock. Hahman hall had been handsomely decorated for the occasion. The Grange was opened in due form by Worthy Master William Johnston. Twenty-one Granges were represented, and 216 fourth degree members answered at roll-call. Committees were appointed as follows:

Credentials—A. T. Dewey, G. W. Hancock, V. W. Still, A. P. Merritt and A. P. Roach.
Order of Business—Amos Adams, B. F. Frisbie and A. L. Chandler.

California Patron—George P. Loucks, Amos Adams, W. W. Greer, C. A. Hall, J. Strentzel, S. T. Coulter, O. Dennis and Mrs. S. J. Cross.
Press Reports—Secretary J. Chester and H. G. Keessing.

Assistant Steward E. W. Davis felicitously welcomed the delegates to the hospitalities of Santa Rosa. Judge Blackwood offered a resolution that quarterly dues from subordinate lodges to the State Grange be increased from 10 to 20 cents for each member of a Subordinate Grange in good standing. Referred to Committee on Resolutions.

The following resolution was introduced by A. P. Roach of Watsonville:

WHEREAS, Taxation without representation is unjust, unfair and unworthy of a liberty-loving people, and our law prohibits women from voting, thereby denying them the God-given right of saying how they shall be governed; and, whereas, our Government affairs have been shamefully corrupt through the administration of man alone; therefore, be it
